Preface

Women's Lives around the World: A Global Encyclopedia provides an overview of the important issues facing women in 150 different countries or territories. Each essay follows the same outline, allowing easy comparison across nations. The encyclopedia examines education, employment, children and teens, health, family, sexuality, politics, religion, and issues specific to each country, such as land rights, trafficking, climate change, and social media. Significantly, this encyclopedia also pays attention to the intersections of social difference in women's lives, noting how women's experiences of gender are shaped by race, ethnicity, language, sexual identity, social class, religion, and ability.

The encyclopedia also uses a decidedly feminist lens to examine all of these issues. Drawing from transnational, multicultural, postcolonial, and queer feminisms, these volumes seek to understand women's lives from perspectives of privilege, power, and systems of oppression.

The volumes are arranged regionally: Africa and the Middle East, the Americas, Asia, and Europe. As feminists, the editors grappled with definitions of *nation* and *region* and often made judgment calls based on feminist perspectives. For example, we have included Tibet and Palestine as separate entries in solidarity with their freedom struggles.

To supplement the essays on each nation, we include sidebars that explore individual ideas, movements, or

events; "Women's Voices" sidebars that provide a glimpse into the life of an individual woman or a group of women; and primary source documents that range from UN statements on women to excerpts from various national constitutions about women's rights. We also offer helpful charts and graphs and bibliographic entries for those who would like to explore issues in greater depth.

Such a project always requires incredible collaboration, and many authors contributed to the depth and breadth of this volume, drawing from their expertise and own commitments to social justice and women around the world. In a show of solidarity, these authors agreed to forego a stipend for their work, and the contributors' budget was donated to the National Women's Studies Association to fund a book award for feminist disability studies in honor of Dr. Alison Piepmeier, a feminist disability studies scholar and professor of women and gender studies at the College of Charleston, who died in 2016.

The bulk of the work for this encyclopedia came from the four dedicated volume editors who recruited writers, provided feedback, edited essays, and ensured a quality project to benefit students seeking to learn more about women. I cannot thank these editors enough—Nancy Barbour, Patti Duncan, Kryn Freehling-Burton, and Jane Nichols, my colleagues at Oregon State University. I also thank the staff at ABC-CLIO who invited us to undertake this project, provided us with guidance and support, and

extended our deadlines when needed—Kaitlin Ciarmiello, Lori Hobkirk, Anne Thompson, Barbara Patterson, and Cathleen Casey.

This encyclopedia is a testament to the enduring spirit of women, across all their differences, in their struggle for survival, civil and human rights, and a better future for all

humanity. Each essay and sidebar is an attempt to make women's lives more visible and to encourage social change toward inclusion, equity, and justice.

Susan M. Shaw
General Editor

Introduction

Welcome to the 2017 updated volume of *Women's Lives: A Global Encyclopedia*. Since the 2003 edition of *The Greenwood Encyclopedia of Women's Issues Worldwide*, women's and girls' lives have transformed in many ways. Organized into four volumes by broad geographic regions—the Middle East and Africa, the Americas, Asia and the Pacific, and Europe—this edition captures how women and girls have reached new heights in gender equality, while sometimes also facing new challenges. Each volume presents an overview of women's lives by country, an approach that fosters a country-by-country comparison, and offers specific discussion of the local issues within a larger global context. The encyclopedia cannot cover every country in the world, but it does provide a glimpse into 150 nations and territories. The concept of *nation* is itself contested, and so the editors have made thoughtful decisions that reflect feminist and liberatory perspectives in the identification of entities covered by separate entries.

In addition to the longer essays about individual countries and territories, we have included sidebars, women's voices, and primary source documents. The sidebars provide information about specific events, organizations, and ideas to supplement the country essays. While overviewing the status of women in each chapter, we also want to keep in mind that behind the numbers are real women who are resisting multiple forms of oppression and making a positive difference in their nations and in the world. These women's voices offer a look into the lived experiences of

an individual or a group of women. These glimpses into women's lives give color and specificity to the ideas and statistics in the longer essays. Primary source documents let readers discover for themselves what nations and organizations have said about women and gender within specific local contexts. Many of these documents come from the United Nations. Others come from the constitutions of various nations or statements by different organizations. Sometimes, we see great support for women. Other times, we see inconsistencies between what various authorities and leaders say and what they do. All together, these supplementary items help to complete the story of each nation by reminding us of women's commonalities and differences, their nations' viewpoints, and the places of their struggles.

In these four volumes, we rely on intersectional, transnational feminist frameworks, drawing attention to the ways gender intersects with race, ethnicity, class and caste, religion, sexual orientation, age, ability, nation, and culture, among other categories of identity and power. We recognize the ways in which understandings of and approaches to gender, womanhood, and femininity (as well as manhood and masculinity) are socially and culturally constructed, taking on different meanings in various contexts. We reject any formation of women's universal experience. In each of the entries, we strive to be attentive to global contexts, geopolitics, histories of colonialism, militarism, and war and relations between nation-states as

well as power differentials within nations and local contexts. In doing so, we work to situate women's lives within analytic frameworks that recognize processes of exclusion and marginalization as well as specific forms of resistance within local contexts.

In 2014, when Margot Wallström, Sweden's minister for foreign affairs, announced Sweden's feminist foreign policy, she said, "The realization is growing that gender equality is not a women's issue but rather a make-or-break issue . . . for peace, security and sustainable development as a whole; a feminist foreign policy is needed, one that defines gender equality as a peace and security issue as well." She went on to explain that, to achieve gender equality, nations must pay attention to what she called the "three Rs"—women's representation, rights, and resources (Sengupta 2016). In early 2016, she reiterated her platform before Sweden's Parliament. Enumerating the critical issues of our time—terrorist attacks, climate change, the war in Syria, Russia's annexation of Crimea, immigration, the escalation of violence in Turkey, and the ongoing conflict between Israel and Palestine—she argued, "The situation in the world calls for a feminist foreign policy that aims to strengthen women's rights, representation and access to resources" (Wallström 2016).

Swedish feminists Karin Aggestam and Annika Bergman-Rosamond argue that Sweden's feminist foreign policy "elevates politics from a broadly consensual orientation of gender mainstreaming toward more controversial politics, and specifically toward those that explicitly seek to renegotiate and challenge power hierarchies and gendered institutions that hitherto defined global institutions and foreign and security policies" (Aggestam and Bergman-Rosamond 2016). As Wallström herself notes, "It's time to become a little braver in foreign policy. I think feminism is a good term. It is about standing against the systematic and global subordination of women" (Nordberg 2015). By enacting feminist priorities for its Foreign Service, Aggestam and Bergman-Rosamond note, Sweden "aims to ensure the security of all human beings and political communities by challenging embedded patriarchal power relations and practices beyond borders" (Aggestam and Bergman-Rosamond 2016). In other words, they make the case that prioritizing women creates greater security for all people and nations.

At the United Nations' Fourth World Conference on Women in 1995 in Beijing, Hillary Clinton declared, "Human rights are women's rights, and women's rights are human rights" (Clinton 1995). Two decades later, Margot Wallström proclaimed, "A feminist foreign policy is an

analysis of the world" (Sengupta 2016). This encyclopedia is an effort in the same vein of understanding the world by centering women and examining their lives in all their diversity from feminist lenses. Women's representation, rights, and resources are important indicators of women's status, and these essays investigate from feminist perspectives both the ways women are systematically disadvantaged and the ways that disadvantage is shaped and multiplied by race, ethnicity, sexual identity, social class, ability, gender identity, and religion.

Despite the obstacles, women continue their struggle for equality, dignity, and human rights, and they have an important role to play in moving women—and the entire world—forward. Women in almost every country of the world have the right to vote and stand for office, and the percentage of women in the world's parliaments has doubled in the past 20 years. But that still means only 22 percent of representatives are women (UN Women "Leadership" n.d.). At least 119 nations have passed legislation on domestic violence, but one in three women still experiences physical or sexual violence at the hands of an intimate partner (UN Women "Violence" n.d.). At least, 125 nations have passed laws prohibiting sexual harassment in the workplace, but 25–50 percent of working women still experience workplace harassment.

There are 143 countries that guarantee equality between women and men in their constitutions, but globally women still earn only 60–75 percent of what men earn (UN Women "Economic" n.d.). Women in almost every country do more unpaid labor than men, provide more emotional labor than men, and have less leisure time than men. "In virtually every country, men spend more time on leisure each day while women spend more time doing unpaid housework" (UN Women "Economic" n.d.). A 2012 study conducted in New Delhi found that 92 percent of women reported having experienced some form of sexual violence in public spaces in their lifetime, and 88 percent of women reported having experienced some form of verbal sexual harassment in their lifetime (UN Women "Violence" n.d.). Worldwide, more than 700 million women alive today were married as children, and in the European Union, 1 in 10 women has experienced cyber harassment (UN Women "Violence" n.d.).

As we look around, we see a number of new and continuing threats that have different and adverse impacts on women. Across the globe, we see a rise of nationalism and the far right. In Europe, many recent elections have seen electoral gains for far-right and nationalist parties,

fueled by fears of immigration, globalization, and concerns about national identity (BBC 2016). In recent elections, nationalist parties have won more than 20 percent of the vote in Switzerland, Denmark, Austria, and Hungary. Research shows that notions of nation and nationalism are gendered in ways that reinforce stereotypical notions of masculinity and manhood and femininity and womanhood and support aggressive militarism and sexualized violence against women (Nagel 1998). During the recent presidential campaign, the United States has seen a rise in white nationalism, “the belief that national identity should be built around white ethnicity, and that white people should therefore maintain both a demographic majority and dominance of the nation’s culture and public life” (Taub 2016). Certainly, the success of the Leave Campaign in Brexit in the United Kingdom was fueled by nationalism and backlash against immigrants. In India, questions of Hindu nationalism, gender, and the rights of religious minorities are an important part of national dialogue (Banerjee 2003).

Very quickly, we see that no threat is an isolated problem. Rather, these threats intersect and complicate one another. The problems of nationalism and the far right are exacerbated by war and the resulting waves of refugee immigration that inevitably follow. And again, we see a gendered problem, where women and children are more likely to be adversely affected by war and immigration or migration, and women are more likely to be vulnerable to sexual violence related to their refugee status (Amnesty International 2016).

War seems a perpetual state in our world, and we know that war disproportionately affects women in specifically gendered ways. “Women and children account for almost 80 percent of the casualties of conflict and war as well as 80 percent of the 40 million people in world who are now refugees from their homes” (Marshall 2004). Julianne Lusenge, the director of the Fund for Congolese Women and president of SOFEPADI in the Democratic Republic of the Congo, says of her country, “At the moment, women from Rutshuru and Beni in the North Kivu province of the RDC are assassinated, massacred, have their throats cut or stomachs ripped open, are raped and suffer sexual violence, are kidnapped and forced to become sex slaves. I can even give you the numbers; but one woman is already too many” (UN Women 2015).

According to Human Rights Watch (HRW), “Women in Syria have been arbitrarily arrested and detained, physically abused, harassed, and tortured during Syria’s

conflict by government forces, pro-government militias, and armed groups opposed to the government” (2014). And the civil war in South Sudan has displaced 2 million people, but sexual violence against women in the conflict is so prevalent that one woman interviewed called rape “a normal thing” (Muscati 2015). According to the United Nations, women and girls suffer disproportionately during and after war, as existing inequalities are magnified and social networks break down, making them more vulnerable to sexual violence and exploitation (United Nations 2003).

Another and a related global problem is growing wealth inequality. Oxfam reports that the world’s richest 1 percent now have more wealth than all the rest of us in the world combined! We also find that income inequality among individuals has grown, and inequalities between countries have also increased. Since the end of the colonial era in 1960, inequality has grown exponentially. The gap between the gross domestic product (GDP) of the United States and Latin America and sub-Saharan Africa has grown over 200 percent, and the gap for South Asia has grown almost 200 percent. While extreme disparities exist within nations, Americans are, on average, 9 times richer than Latin Americans, 72 times richer than sub-Saharan Africans, and 80 times richer than South Asians (Hickel 2016). Research suggests that closing the gender gap in labor around the world would raise nations’ GDP significantly. More importantly, we know women are more likely to live in poverty and experience its ill effects. Additionally, economic risks are often placed on the poor, especially women, increasing their vulnerability to weather-related, political, and economic crises (Oxfam 2013). Creating equality for women can both address the grinding poverty in which so many of the world’s women live and help close the inequality gap among nations (McBain 2014).

Women’s reproductive rights remain a persistent issue around the globe. Maternal mortality is the second-leading cause of death for reproductive-age women, and yet 225 million women around the world are not able to use modern contraceptives to delay or prevent pregnancy (Feminist Campus n.d.). In 2015, around 303,000 women died from unnecessary complications during pregnancy and childbirth. One-third of maternal deaths occur in South Asia alone (Feminist Campus n.d.). India has the highest number of maternal deaths in the world at around 50,000 per year (Barnagarwala 2014). In India, women face low levels of access to contraceptives and lack of control over reproductive decision making, which are exacerbated by

poor nutrition, low levels of education, poverty, and lack of access to health care (Human Rights Law Network 2013). In the United States, 600 women die each year from pregnancy-related complications.

While the U.S. Supreme Court's decision in *Roe v. Wade* in 1973 guarantees women's constitutional right to abortion, individual states' restrictions and the closures of clinics have severely limited access in recent years. The Affordable Care Act, also known as Obamacare, provided universal coverage of costs for birth control pills, but the Supreme Court decision in favor of Hobby Lobby, an arts and crafts chain store owned by conservative Christians, has allowed employers to opt out of providing contraceptive coverage through insurance based on the employer's religious objections. As of the writing of this encyclopedia, the new U.S. administration seems poised to defund Planned Parenthood, an organization that provides reproductive health care. At risk are not only sex education and information about birth control and abortion, but also screening for sexually transmitted infections (STIs), mammograms, and tests for cervical and other cancers. For many poor women, Planned Parenthood provides their only access to health care of any kind. The new president has promised to repeal Obamacare and to appoint Supreme Court justices committed to overturning *Roe v. Wade*.

Again, however, women are not simply passive about their reproductive rights. Around the world, women continue to fight for control over reproductive decisions and access to the best reproductive health care. In 2008, public health activist Sandesh Bansal sued the state of Madhya Pradesh over the number of women who die in pregnancy or childbirth (Center for Reproductive Rights 2009). According to the suit, the state was accountable for the poor conditions of its health facilities, which contribute to the high maternal mortality rate. Facilities provided too few workers, inadequate services, and too little equipment to address the needs of pregnant women. In 2012, "judges declared that the state of Madhya Pradesh had violated a woman's 'fundamental right to live' when the government failed to provide proper prenatal care and maternal health services in an appropriate and timely manner" (Center for Reproductive Rights 2012).

Women in the United States are also organizing to fight attempts to roll back reproductive rights. In a more humorous response to the administration's threats to reproductive rights, in the first few months following the 2016 U.S. election, women's rights advocates made more than 80,000 donations to Planned Parenthood in the name

of Mike Pence, the nation's new antichoice vice president (Ryan 2016).

Perhaps right now the greatest risk to the planet, and especially to women, is climate change. In the past 10 years, 87 percent of disasters have been climate-related (United Nations Office of Disaster Risk Reduction 2015). Climate change multiplies the threats women already face—hunger, poverty, disease, and violence. In many parts of the world, women have little access to decision-making and economic powers that might mitigate environmental disasters brought on by climate change. Often, in rural communities, women are the ones who must fetch water and firewood from great distances. As agricultural practices and climate change makes these resources scarcer, women have to travel farther to find what they need. In agricultural areas, climate change threatens food supplies. Women are 45–80 percent of the farmers in developing nations. In rural India, 58 percent of households farm, and most of these families rely on farming for their livelihood. Women are the majority of these farmers, though they usually do not own the land they farm (Tewari 2016).

Environmental disasters in India are also contributing to the displacement of rural people as they move to cities to flee the consequences of climate change. For example, flash floods in Uttarakhand have caused massive landslides that have killed hundreds of people and destroyed millions of dollars of property. Flooding in Uttarakhand, Assam, Jammu, and Kashmir has displaced 1.5 million people since 2012. Other Indians are leaving their rural homes for the cities because of droughts that have dried up their crops. Of course, this mass migration is now putting added strain on India's cities. Indian experts suggest the country may be headed toward a "large-scale humanitarian crisis" without direct, immediate, and profound intervention (Lal 2016).

In disasters, women typically stay behind to provide care for the wounded, putting themselves at risk for injury or disease. If family members experience long-term effects from the crisis, women may not be able to return to the workforce because they are needed to continue care for their families.

Climate change is even leading to increased violence against women. In Guatemala, girls have been kidnapped and raped, as they have had to walk farther to fetch water. Climate change has also been linked to increased health risks, such as miscarriage (Paul 2016).

Not surprisingly, women are fighting against climate change, both by challenging policies and practices that

contribute to climate change and by adapting farming practices to deal with the new realities of the climate. In India, around 84 percent of women are involved in agricultural activities, and so they are more vulnerable to climate change (Global Voices 2009). Gender inequality adds to that vulnerability. In India, the world's third-largest emitter of greenhouse gases, agriculture accounts for nearly 30 percent of greenhouse gas emissions (Acharya 2009). Indian women farmers are taking steps to lower these emissions by planting crops that require less water and by not using chemicals, such as pesticides (Global Voices 2009). They are planting crops suited to their region and constructing embankments to capture rainfall and prevent soil erosion (Akbar 2015). "In Tamil Nadu, women farmers have made food last longer by improving post-harvest traditional systems. Up to 20 different traditional post-harvest practices have been developed and refined over generations. They vary according to the specific crop, but commonly including threshing, winnowing, cleaning and drying" (Eugenia 2013). While women remain underrepresented in decision making to address climate change, the government of India has committed to steps to encourage and support women's participation in climate change decisions (United Nations Climate Change Newsroom n.d.).

Around the world, women are taking steps to combat climate change. In Darfur, one project provides low smoke stoves to cut down on smoke emissions. In Guatemala, women farmers are planting trees to help lower carbon levels. In Australia, 1 Million Women is a women's environmental organization that empowers women to take steps in their daily lives to shrink their carbon footprint (Figueres 2014). The U.S. women's organization MADRE has developed a program for Women Climate Defenders that works with grassroots partners in communities to enable adaptation to climate change and to bring grassroots women's voices to national and international climate policy discussions (MADRE n.d.).

We know from the research that when women are involved in political processes, they make important impacts. For example, research shows that when women are involved in peace agreements, the agreements are less likely to fail (Bigio and Vogelstein 2016). Yet, women have made up only a small proportion of peace negotiators, signatories, and mediators (Strasser 2016). In 2014, Oxfam reported, "Afghan women have been systematically excluded from the government's efforts to start peace talks with the Taliban" (Nordland 2014). In an address to the UN Security Council, former UN secretary-general Ban Ki-moon

noted, "Look at the pictures of peace negotiations on Syria or Yemen. There may be one woman at the table or in one delegation. This is fully representative of the general picture. And all this is against a backdrop of women and girls suffering inequalities that are aggravated by conflict, who are targeted for particularly brutal crimes by violent extremist groups including Daesh and Boko Haram" (United Nations 2016).

In a clear example of the important role women must play in negotiating peace, women in Colombia demanded a place at the table to negotiate peace with the FARC (who also included women negotiators). The two sides created a gender subcommission specifically to examine how the proposed peace plan would affect women and to ensure the plan promoted gender equality. In particular, the proposal paid attention to acknowledging and addressing violence against women. Government and FARC leaders signed the peace deal in November 2016 (Krystalli 2016; Casey 2016). Research also shows that women's participation in security forces improves success. Women are more likely to de-escalate situations without the use of excessive force and are more likely to build community relationships that create positive perceptions (Bigio 2016).

So, what if we imagine a world guided by Margot Wallström's vision of a feminist foreign policy? Wallström's first question is one of representation. Are women at the table? Women's participation in defining and implementing policy is essential, although we must recognize that women are not a monolithic group, and diverse women will have diverse viewpoints. In particular, in imagining a feminist policies and practices, we must recognize that not all women are feminists and feminists themselves do not have a single vision of global relations and human security. If the women at the table only represent the interests of white women of the Global North, then many important issues for women of color, poor women, and women from the Global South are likely to be overlooked. Furthermore, if the women at the table are antifeminist, then policies may actually be detrimental to women.

The second question raised by Wallström is one of rights. Do women have equal rights? Are women's human rights respected and promoted? We know, of course, that women do not have equal rights, but feminists can demand that governmental policies and economic support ensure equal rights within the programs it creates and funds. Feminists can put pressure on governments to enact laws, programs, and enforcements that ensure equal rights. We can look to our own houses to see whether equality is part of the

national fabric and demand changes within our own borders. Of course, we also know that many of the problems of unequal rights faced by women around the world are directly related to long histories of patriarchy, colonialism, racism, and neocolonial interventions of the past 50 years.

Wallström's third question is one of resources. Are women provided with equitable resources? Typically, wealth is reported as a household figure, which obscures the fact that most of the world's wealth belongs to men. Even among the 1 percent, few women are the primary earners or holders of wealth. This discrepancy becomes even clearer as we move down the economic scale and find women lagging behind men in wealth and income (Jaggar 2008). We often see in foreign aid programs that assumptions about gender exacerbate resource inequalities, providing resources for men based on gendered assumptions about work, family, and income management, and ignoring the women who may actually be the workers in the family and who may need to manage income generated by foreign aid programs.

The United Nations University has called for a program of foreign aid for gender equality that moves beyond simply safeguarding women's rights to providing opportunities for gender equality (Nanivazo and Scott 2013). A report by UN Development Fund for Women (UNIFEM), the European Commission, and the International Labour Organization (ILO) found that priorities for gender equality in ownership often disappeared in actual implementation of policy, demonstrating the need for ongoing scrutiny of actual practices in policy making and implementation (Chiwara and Karadenizli 2008).

Not surprisingly, however, putting women at the center of foreign policy is not an easy task. "Human" rights are still overwhelmingly defined by men's needs and experiences. Women's rights are still seen as secondary, a "niche" issue. Even for Margot Wallström, the implementation of her vision of feminist foreign policy has not been easy or, as of yet, especially successful. Wallström called Saudi Arabia a dictatorship and criticized its treatment of women. She also spoke out against its flogging of a Saudi blogger. In return, Saudi Arabia accused Wallström of attempting to interfere in its internal affairs, broadened its interpretation of her remarks to be an insult to all Muslims, and then barred her from giving a speech to the Arab League. The kingdom then recalled its ambassador and refused to issue business visas to Swedes after Sweden announced it would not extend a defense cooperation agreement with the Saudis.

The defense agreement, however, had long been a boon to Sweden's powerful businesspeople. Wallström said the deal was symbolic of Sweden's values of "democratic development, equality and women's rights," and so keeping the deal was impossible (Al Jazeera 2015). The reality of politics, however, eventually set in. Because of Saudi Arabia's significant business dealings with Sweden, Wallström had to back away from her statements to resume normal relations with the Saudis.

The goals of feminist foreign policy will inevitably be in conflict with business-as-usual policies. Even insisting on basic human rights for women is still controversial in many places, and, for global powers such as the United States, feminist foreign policy flies in the face of long-standing neocolonial interventions around the world and ongoing patriarchal and settler colonial practices at home. Nonetheless, the goal of bringing women to the center of foreign policy is an admirable one that should be given thoughtful attention by the governments of the world. While enacting feminist foreign policy would undoubtedly upend many of the practices of most of the world's nations in relation to one another, we know that when women prosper, everyone benefits.

In the four volumes that follow, we offer entries by many authors that each include a general overview of women's lives in that context as well as brief discussions of the experiences of girls and teens, women's access to education, women's health, women's experiences of employment, women's roles in family life, women in politics, and women's experiences of religious and cultural roles. The authors also identify and discuss additional pertinent issues for women and girls in each locale. We recognize that the information provided in the four volumes of this encyclopedia is not necessarily comprehensive. Rather, our authors offer a snapshot of women's lives in the countries included in each volume.

As societies change rapidly, women's relationships to various social institutions also change. For instance, between the time we began work on this encyclopedia and the time it was published, substantial changes have occurred in many countries. Military coups and worsening civil wars affect not only individual countries but also whole regions, and indeed the world, as nations and activists respond to these humanitarian crises. In addition to health crises that develop out of the instability and damaged infrastructure caused by war and armed conflict, disease is always most rampant in the most vulnerable strata of societies. Tuberculosis (TB), HIV/AIDS, and Ebola are

just several of the pandemic diseases that continue to challenge individuals and governments, both local and global, in recent years. Women bear a disproportionate prevalence of infection as well as the gendered burden of caregiving that sick and injured people need.

The instability caused by these recent and continuing conflicts and disease outbreaks can throw a nation into such disarray that current information about a range of issues is nearly impossible to find. Health care statistics become secondary to relocating a bombed hospital and bringing in medical personnel to handle not just injuries, but illnesses, births, and chronic health conditions. The need for survival and subsistence affects the issues a country can address and what can be tracked.

Nations also are reluctant to gather data about practices deemed illegal or immoral, making it difficult to find basic information about people and their experiences, such as LGBT communities, people who seek abortions, and those who have experienced a range of types of violence. Out of 53 nations on the continent of Africa, for instance, 70 percent have laws making same-sex relationships illegal and punishable by fines or, in some cases, death. Rarely are indigenous peoples mentioned, much less centered, in discussions of nations and land. Whenever it was possible to find information, we prioritized examining official and unofficial information about LGBT and indigenous peoples as a way of making visible those who are often not seen.

At times, the information our contributors could find about particular topics was incomplete or inconsistent. We include the most recent statistics and context possible and encourage readers to use the “Further Resources” sections for more detailed research and information. We hope these volumes inspire critical thinking, conversation, and a desire to know more about the lives of women around the world. While many women have made progress, much work remains to be done. We also hope these essays evoke a commitment to work to improve the lives of women and all marginalized people.

A

Afghanistan

Overview of Country

Located in South Central Asia, Afghanistan is a landlocked country about 252,000 square miles in size (652,000 sq. km). It shares borders with six countries: Turkmenistan, Tajikistan, and Uzbekistan make up its northern border; Pakistan lies to the southeast; Iran is to the west; and China is at the northeastern corner of the territory. Although its terrain is mostly rugged mountains, the land is made up of plains in the northern and southwestern regions of the country.

As of 2012, the population of Afghanistan was approximately 29,824,500 (UNICEF 2013). The UN Development Programme (UNDP) ranked Afghanistan 149th out of 187 nations examined in the 2013 data collection for the Gender Inequality Index (GII, 0.705). The nation ranked low because women's issues have received little attention as the general state of human development remains at a disadvantage because of Afghanistan's tumultuous history.

Since the Soviet intervention in 1979, Afghanistan has suffered repeated devastating military action that has disrupted the political, economic, and social peace of the nation. After the conflict with the USSR and a civil war that pushed to overthrow Soviet-backed leader Mohammed

Najibullah, the country spiraled into its infamous Taliban regime. Since the 1996 shift to a Taliban-controlled nation, Afghanistan has stood out as one of the most dramatically oppressive nations for women to survive in. Under Taliban rule, Afghan women were restricted in virtually every area of their lives. Their rights to work, education, and health services were severely restricted. Additionally, the turn to extreme physical abuse and unjustified government punishments made simply being a woman a dangerous act. Upon the fall of the Taliban in 2001, revisions to the constitution and updated legislation began to gradually revive women's rights in Afghanistan.

Despite the overwhelmingly negative environment Afghanistan has been for its women since the 1970s, the stereotypical characterization of Afghan women as powerless until help arrives from the West has been blown out of proportion, specifically in the Western world. Over the last few decades of social collapse and political strife, women have upheld their own communities of resistance and survival centered on the needs of their gender. For instance, as they were forced by the Taliban to develop their own underground schools, women and girls found long-term ways to allow their communities to thrive, even after the fall of the Taliban regime. The understanding that serious change is necessary to the advancement of human development is taught among women, inspiring solidarity in many men as well. Afghanistan is still facing the challenges

What Is “Middle East”?

The term “Middle East” is problematic, in part, because it is viewed as a geographical term, and that is inaccurate. The boundaries of the Middle East have frequently changed since the term was coined in the early 1900s. At that time, it referred to the Gulf of Aden and India, but the term “Middle East” has been applied differently and more broadly than that. It is not used uniformly across nations, academic fields, or time. It is more of a political term than a geographical one.

The Middle East’s geographic boundaries change as the world’s (especially the global superpowers’) politics change (e.g., 9/11 for the United States). Given the global superpowers’ ability to define the boundaries of the Middle East as they see fit in current political climates, the term implies a distinct imperialistic use of “Middle East.” Language gives power and dominance. It is perhaps most reasonable to give the Arab region power to name its own region. Currently, Arabs divide their region into the subcategories of the Levant, the Mashriq, and the Maghreb. Imposing our labels on their countries is a current version of imperialism.

—ReGina E. Kaylor

of reconstruction, especially after the most recent conflicts since 2001 with the United States, and further issues with the Taliban. Many women continue to focus on economic opportunities and closely examine any possibilities of financial support.

According to the Gender Equality Project II (GEP-II) in Afghanistan, which seeks to further gender equality and female empowerment, signs of progress have become more visible as time goes on (Priya 2014). However, any initiatives attempting to better social, economic, and political opportunities for Afghan women still have a long way to go. Literacy rates are drastically low; vulnerability in the workforce limits women’s participation economically; and incidents of violence are seldom reported because of deeply ingrained religious and cultural norms and the fear of violating these norms. With consistent effort, the women of Afghanistan are making great strides in their recovery from the overall deleterious results of political upheaval in the last three decades.

Girls and Teens

Life for young women in Afghanistan is still bleak because of extreme Taliban mandates that have limited their lifestyles in comparison to those of their male counterparts. Literacy rates are drastically low among Afghan girls, and any push to improve these rates is too recent to display huge increases. Girls’ opportunities to grow up and seize their individuality are harshly restricted by the common practice of child marriage. The progress that both world-wide humanitarian organizations and domestic resistance efforts aim to make is slow moving but highly necessary; girls and young adult women in Afghanistan are only beginning to receive widespread acceptance of their rights.

Opportunities for Literacy, Schooling, and Recreation

UNICEF’s 2010–2011 Afghanistan Multiple Indicator Cluster Survey (AMICS) examines several fields regarding the quality of life of Afghan men, women, and children. Because of the gender discrepancies in Afghan society, AMICS gives perspectives specifically focused on children’s experiences and highlights any unequal differences between women and men.

Early on, many Afghan children are at a disadvantage to attaining literacy. AMICS data report that only 2 percent of children under the age of 5 reside with families that own 3 or more children’s books. The percent of children who have access to 10 or more books is negligible.

Although there is no variance in accessibility between households with male or female children, the influence of gender inequity becomes evident when one focuses on parental involvement. The mother’s educational level affects the likelihood of her children’s exposure to reading material. When examining families in which the mother has received an education at the secondary level or higher, 11 percent of children have 3 or more books. In comparison, only 2 percent of children in families in which the mother has no education have 3 or more books.

Young women aged 15 to 24 had their literacy assessed by AMICS. The results of the survey show that one in five women is literate. There is a great discrepancy between urban and rural as well as wealthy and working-class families; the greater a woman’s accessibility to education due to her socioeconomic standing or geographic location, the more likely she is to be literate, in some cases by a factor of 10. Likewise, data collected reflecting the frequency of children attending school show a positive correlation

between a mother's socioeconomic status and her children's enrollment in primary school.

As of 2008, UNESCO is leading the Enhancement of Literacy in Afghanistan (ELA) program to improve these statistics. The initiative takes additional measures to spotlight the disparity between women's and men's literacy rates. It cites the cultural norms that are harmful to the advancement of women's and girls' educations, including the Taliban's prevention of allowing them to go to school, safety issues in transportation to schools, and familial discouragement of women's education. ELA moves to better the state of literacy rates for women and girls by increasing the number of opportunities available to girls in urban and rural areas and pushing to instill new policies on a nationwide level.

With fewer opportunities to integrate socially, Afghan girls have limited options for enjoying recreational activities. Even when girls are not married off at an early age and therefore given a chance at girlhood, the availability of social settings that offer activities outside of the home is small. Should they get the chance to leave their homes, they must be escorted by a male relative. Taliban control over the nation inspired the Women's Association of Afghanistan to institute underground social circles and classes offering craft groups, literacy training, and education regarding women's resistance to the oppressive regime. These groups are still active today.

Child Marriage

Afghanistan demonstrates an incredibly high frequency of child spouses. Many Afghan families accept the potential for financial reward and social benefits and do not view child marriage as a violation of human rights. The prevalence of such marriages reinforces the political, economic, and social oppression that girls and women face, beginning with the denial of the right to consent to marriage in the first place.

Because of the war-torn state of their country, people in Afghanistan must find ways to survive in poverty. This burden falls disproportionately on girls, as they are often used as a method of payment to settle a family dispute or repay a debt. Families will offer up their daughters as brides to relieve the financial strain of taking care of a large family. Kidnapping and rape are risks that girls face, and many families will rush their daughters into marriage in an attempt to prevent them. Frequently, older men take these girls as their brides, and sometimes they only make themselves known to the girls on the day of the wedding.

In rural areas, up to 80 percent of marriages are arranged. The wishes of the bride are never considered. More than 50 percent of girls in Afghanistan are married or engaged by the age of 12 (Trust in Education 2015).

Upon marriage, girls can no longer pursue an education; therefore, most girls remain illiterate for the rest of their lives. They are pressured by their husbands and in-laws to dedicate themselves to domestic life. These children must then raise their own children, and the young brides routinely encounter horrible sexual health issues as they are forced into child-rearing at such an early age. The girls' chances of experiencing pregnancy without dangerous health threats are incredibly slim. Their daughters and sons are also at a high risk of death during childbirth.

Education

Educational opportunities for women in Afghanistan have been stifled on a nationwide level. Under the Taliban, educating a woman in any school setting became a punishable offense. Although they were stripped of their ability to attend organized lessons, women found ways to defend their right to learn. The chances for women pursuing an education have been slowly improving. Still, the disordered social, political, and economic situations in Afghanistan have not allowed a concentrated effort on the issue of women's education.

Women's Education under the Taliban

Because of the Taliban regime that took hold of Afghanistan in 1996, the opportunities for education have been severely limited for women. Even at the most basic primary school level, few girls were able to take advantage of basic lessons in reading, writing, and arithmetic. As the literacy rates of Afghan women were already low, mothers also had little ability to educate their children. Prior to Taliban takeover, 32 percent of girls attended some type of school. After closures of designated female-only educational institutions and new sanctions, enrollment dropped to just 6.4 percent (Oxfam 2011). The Revolutionary Association of the Women of Afghanistan (RAWA) provides an extensive list of oppressive Taliban mandates that targeted women. Many of these focus on limiting women's accessibility to education:

- Complete ban on women's work outside the home, which also applies to female teachers, engineers, and most professionals.

4 Afghanistan

- Complete ban on women's activity outside the home unless accompanied by a *mahram* (close male relative such as a father, brother, or husband).
- Ban on women studying at schools, universities, or any other educational institutions. (Taliban converted girls' schools into religious seminaries.)
- Ban on women laughing loudly. (No stranger should hear a woman's voice.) (RAWA 2016)

Women and girls who violated, or were accused of violating, these mandates received harsh punishments, including imprisonment and painful, degrading physical abuse that was often presented before an audience of civilians. Despite the risks, however, women from various socioeconomic backgrounds supported a significant movement of underground schools. As previously mentioned, the Women's Association of Afghanistan offered craft groups, literacy training, and education regarding women's resistance to the oppressive regime. Women volunteered their homes to provide inconspicuous safe spaces for teachers and their pupils, and neighbors and peers supported them, providing a source of income for the women hosting the underground courses as well as boosting community involvement in fighting the erasure of women's education. Depending on the skill level of the available mentors, some circles taught complex subjects in the sciences, foreign languages, and religious studies. Although many of the managers of and participants in these secret schools were caught and persecuted by the Taliban, the people who instituted these safe havens for women and children persevered in their struggle.

Advancement since the Taliban

Since the release of the Taliban's stranglehold on Afghanistan, the number of girls enrolled in schools across the country has risen significantly. While there were 5,000 accounted for just 15 years ago, Oxfam's 2011 article "High Stakes: Girls' Education in Afghanistan" reported 2.4 million girls attending school (Oxfam 2011). Although this total continues to rise, the rate of increase has noticeably slowed over the last decade. Immediately after the destruction of Taliban control over Afghanistan, domestic and foreign relief efforts focused on reopening girls' schools and encouraging women's education opportunities.

Unfortunately, many of these solutions were created with no sustainable long-term plan in mind. The demand for accessible, stable spaces as well as reliable female

instructors is too high to support such a sudden rush of students. For many students and teachers, especially in rural communities, the distance to a school is too far to be safely traveled. And poverty continues to stand in the way of girls and their education. Families demand their daughters and wives remain at home or serve as a source of income. Cultural attitudes surrounding sending girls to school also vary greatly across the different regions of Afghanistan.

The issues that Afghan women now face have been supported by general movements to allow girls access to education. At this point, however, individual communities will have more influence over sustaining these advancements. The more local the solutions become, the more effective they will be, particularly intergenerationally, as young mothers and older women will become more involved in the upward trend of education opportunities.

Health

The state of health care in Afghanistan is dire for everyone. The entire population faces major accessibility issues, and current relief efforts are not moving forward at a rate that can satisfy the huge demand for comprehensive treatment options. Because women's health is viewed as a unique specialization, where male doctors cannot treat female patients, regardless of the situation, it does not receive the attention most women are waiting for to address their concerns. This is made especially evident by the fact that few reports examining trends in women's health issues exist, with the exception of reproductive health-related problems.

Access to Health Care

The inaccessibility to health care that women face in Afghanistan is arguably the greatest obstacle to their receiving proper treatment for any type of medical issue. There are several layers to these issues, the first being the overall state of hospitals and clinics over the last few decades of political upheaval. War has destroyed health centers all over the country, causing any remaining resources to be dangerous to use and in short supply. Specialized services for women have been of low priority in public health reconstruction efforts. Even basic demands are challenging for hospitals and medical laboratories to make possible; inadequate quantities of medicines and lack of sterile locations affect the high infant and maternal mortality

rates. The conditions of functional hospitals are dire; only about half have potable water, and about one-quarter have electricity. Oftentimes, women and children have preventable or easily treatable illnesses but are not in situations that allow them to receive the treatment they need. The impoverished status of the country puts the entire population at a disadvantage in accessing the appropriate health care.

A second pressing issue associated with accessibility to clinics and hospitals is the mobility issue that many women face. Women living in poverty do not have the funds to travel to places where they can receive treatment; therefore, they are forced to wait until the last possible minute and are beyond a preventable or easily treatable stage of illness. Additionally, many of these women live in rural areas where there are no resources for travel across large distances. The unequal placement of health care centers contributes to reduced accessibility. More than 80 percent of the population resides in the Afghan countryside, where not even radio transmissions announcing health or hygiene concerns will reach the people (Riphenburg 2004).

The next issue facing women's health is the incredibly low number of female health professionals. Afghan women cannot receive care from male doctors. Therefore, with so few women doctors, many women are excluded from treatment possibilities. War has already forced medical professionals out of the country and significantly reduced access to medical education for prospective students, as well. For women specifically, who were targeted by the Taliban and denied any access to education, this means that an entire generation of potential female doctors and nurses have been denied their chance at serving as health professionals for other women. However, even prior to and now after Taliban control of the nation, Afghan women's medical schooling does not compare to that of their male colleagues. Those working in public health in general do not receive fair or consistent salaries, forcing a woman with medical training to turn her attention to other professions to provide for herself or her family.

Afghanistan's public health initiatives do not place women high on the list for domestic relief efforts, nor are they taken into consideration in foreign assistance programs. However, international humanitarian agencies such as UNICEF and USAID have been bringing in monetary and other resources. The best possible resource at this point is to provide women with the ability to create health care opportunities for other women.

Maternal Health

When specifically examining the situation of women's health through the lens of maternal health, the issues present are even worse. A staggering 98 percent of Afghan women do not use modern contraception. As previously mentioned, health centers are severely lacking in resources for women to receive prenatal care. This does not improve when women give birth; 92 percent of babies are delivered with no health professionals present. Maternal mortality is estimated to be once every 30 minutes, or about 1,700 per every 100,000 births (Riphenburg 2004).

Another issue that contributes to such a high mortality rate is the age at which many girls become mothers. Approximately two-thirds of women report having given birth to their first child between the ages of 13 and 19 (Van Egmond et al. 2004). This introduces a completely new host of issues. Many children living in poverty in Afghanistan are chronically malnourished, causing their children to also face problems with stunted growth. The girls themselves are likely to suffer through complicated deliveries because of their premature reproductive systems (Riphenburg 2004).

Diseases and Disorders

Because of the already negligible attention paid to women's health issues, little data exist on conditions that specifically affect them outside of reproductive health. Sexual health is of utmost concern, particularly in regard to maternity issues. However, when 98 percent of Afghan women do not use effective contraception, it also reflects poorly on the rates of sexually transmitted infections (STIs). Few Afghan women understand how to properly prevent STIs (Van Egmond et al. 2004).

A grossly overlooked issue affecting women's health is mental well-being. Due to the traumatic events associated with war and oppressive political regimes, women undoubtedly face psychological conditions such as depression, anxiety, and posttraumatic stress disorder. Eighty-four percent of Afghan women report having lost family to war, and no grief counseling or emotional support services exists for them (Rasekh et al. 1998). Under the Taliban, women were subjected to cruel and unreasonable punishments, such as acid attacks and public stonings.

Even if a woman did not experience direct harm, it is likely that she would have been forced to watch public executions, displays of torture, and other disturbing exhibitions of inhumane practices. Although the numbers are

still lacking, there is strong evidence that increasing numbers of Afghan women are also turning to drugs (Riphenburg 2004).

Employment

As in most other areas of their lives, the Taliban severely restricted women's work opportunities. Because of the added disadvantage of low literacy and education rates among females, women are often unqualified and unable to obtain jobs in the first place. Typically, women's skills do not extend beyond seamstress duties, which are not in high demand.

Therefore, most women rely on male partners or family members to provide for them. In a 2012 survey by the World Bank, 14.4 percent of women aged 15 and older participate in Afghanistan's workforce (World Bank 2015a). In comparison, 80 percent of men are engaged in the workforce. Although the majority of employed women have occupations within the government, Reuters 2012 data show that of the 363,000 people working for the state, 74,000 are female. Similar to the case of accessing education, issues of accessibility to work affect women greatly. Of the 14.4 percent who are engaged in paid work, just 8 percent hold jobs in areas beyond the agricultural sector (UN Women 2013).

With reconstruction and reform efforts, the situation has begun to improve. In 2014, the Asia Foundation's *Survey of the Afghan People* reflected increased support for women enlisting in the national workforce (Ayubi 2010). As the Taliban regime's norms become outdated and challenged, popular opinion turns in favor of women pursuing job opportunities, which can be seen in the approximately 68 percent of Afghan citizens expressing interest in female participation in the common labor force.

Obstacles to Women's Employment

The most pressing issue in regard to employment is harassment, both on the job and as an overall social stigma against women performing paid labor. The safety risks associated with pursuing a job may outweigh the benefits; regardless of family or peer support, women often give up jobs because of widespread discrimination. Women experience sexual harassment, abuse, rape, and other forms of gender violence at their workplaces.

Despite the frequency of such occurrences, government officials have been slow to combat this problem, with only

Afghanistan's Independent Directorate for Local Governance having come up with any antiharassment codes that are inclusive of women. Government interference has been driven by analyzing the effect women's unemployment has on the nation as a whole; when a female family member can bring home a salary, her children have a greater chance of growing up healthy and obtaining an education. This point of view, combined with the prospective growth of the nation's GDP, pushes policy makers to see the long-term effects of ending gender-based harassment in the workplace

Developing Opportunities

Although internal reform is slow to progress, external international help has unveiled new goals to better the situation of women at work. The Ministry of Education of Afghanistan is receiving foreign aid and other assistance from such agencies as the World Bank Group to develop such projects as the Female Youth Employment Initiative (FYEI) to promote the acceptance and safety of young women finding and keeping jobs. FYEI and related efforts, such as those instituted by UN Women and Afghanistan's Ministry of Women's Affairs, aim to focus on individual communities' resources for women seeking work, including training and placement services.

Furthermore, these programs address fundamental security issues, as young women and their families refuse to pursue opportunities that may place the woman's safety in jeopardy. When given a secure, reliable alternative to finding work through such agencies, families support their female members' involvement in the workforce. This heightened encouragement allows women to engage in empowering job training that will teach them new skills, making them prime candidates for all manner of jobs. By keeping these initiatives no larger than community-wide, women are able to maneuver around mobility issues and stay near their employers to maintain connections with bosses and coworkers without fear of encountering harassment.

Politics

Not surprisingly, the fall of the Taliban regime has allowed new opportunities to arise for women seeking representation in politics. Whether they wish to occupy seats in office or simply contribute in an election, women can now take advantage of a more progressive political system.

However, societal change comes slower than political reform. Despite legal protections, the Afghan judicial system often disregards written law in favor of sharia, the customary Islamic law that has roots in long-standing cultural norms. Therefore, many women looking to make headway in politics feel limited by being silenced by their male counterparts and the potential for violence against outspoken women.

Women in Politics

Women's participation in government since the fall of the Taliban has been steadily increasing. Afghan constitutional law stipulates that within each province of the country, at least two women must be elected members of the lower house. They must also make up 16 percent of the upper house. Public participation in governmental matters has also skyrocketed. In 2014, Afghanistan's presidential elections showed a remarkably high turnout of female voters. As previously mentioned, women's possibilities for running for office have only broadened.

Conservative attitudes regarding women in politics, however, have caused female voices to be silenced in debates and discourse. As the threat of Taliban control continues to press government leaders, women's rights in politics and other public spheres may be given away to maintain order. This becomes most evident in the tenuous nature of quotas of women in political arenas. Furthermore, just because these quotas are in place does not indicate there has been any marked influence of women's participation in government. Male politicians may not take their female counterparts as seriously, and by having such a public presence, many politically inclined women are targeted by extreme conservatives with violence. Because Afghanistan is built on a patriarchal system, both politically and economically, the male majority has little motivation to rally for women's rights.

Female journalists and media correspondents have risen to the occasion to provide a crucial voice for women in the context of public policy and opinion. As of late 2012, about 25 percent of the reporters in Afghanistan were female. The inclusion of women and girls in widely broadcast media platforms incites important debate and exposes the reality of gender inequality in a post-Taliban society. But because female journalists are in the spotlight even more than politicians may be, their work is highly dangerous and may result in their being targeted with violence (Powell 2014).

Women and the Law

Examining the formally written legal codes of Afghanistan reveals a significant number of rights pertaining specifically to women. The nation's 2004 constitution contains unambiguous language explicating equality between men and women. The Afghan Civil Code (1977) provides distinct examples of gender equality. For instance, it allows women the rights to their own property and the ability to request a divorce. The Afghan Criminal Code (1979) defines differences between abduction and elopement to protect married couples. Other legislation granting women's rights include election law, which ensures women's right to vote and stipulates a certain amount of female participation in elected bodies. All women, even those in poverty, are entitled to legal aid.

Beyond legal codes and articles, plenty of national gender equality initiatives exist that emphasize the importance of women's rights. Since 2011, enrollment of female students has reached approximately 3 million, in contrast to the few thousand who risked their lives for an education because of radically restrictive Taliban policies. Furthermore, women now enjoy the opportunities to run for public office; in 2009, the presidential race featured two women, and seven other women ran for vice president. A significant portion of women also participated in provincial council elections. Women are also now serving as police officers, soldiers, and attorneys far more frequently than ever before.

Although these laws are clear on paper, they are seldom followed in Afghan society. Education is still an unrealistic goal for some women, and many feel unsafe taking control over their lives as wives or daughters. Gender inequality is rampant in hiring processes. Victims of sexual violence are consistently punished for moral crimes rather than an assailant receiving an appropriate sentence for his actions. The judiciary system is partial to sharia, which draws from religious and cultural rights and wrongs rather than a set of legal codes. Because of the unreliable legal history of the country, Afghan citizens often feel mistrustful of hard law and would rather rely on traditional customary law.

Combined with the skepticism of the motives of Western relief efforts, the Afghan government has lost popular support. As the media shows Western aid as negative, invasive, and potentially dangerous, many women's rights efforts, which stem from international groups and are endorsed by the Afghan government, will not be backed by politicians. To combat this, women's groups must turn to a

community approach and appeal to the attitudes of Afghan citizens; in other words, they must rely on customary law to show the importance and validity of gender equality.

The difficulties in approaching gender equality exclusively through Islamic law are numerous. As with any religion, Islamic interpretations can be wildly different among Afghanistan's many communities, particularly between urban and rural locations. Tribal traditions may uphold beliefs that modern law does not, which turns people working in government positions away from certain beliefs, depending on their understanding of Islam. When social activists claim to solely be interpreting Islam to make progressive claims, they may be dismissed on grounds of blasphemy, especially by radical Islamic groups. Although the obstacles are plentiful, secularizing women's rights movements excludes too many communities from the conversation surrounding gender equality in Afghanistan.

Religious and Cultural Roles

The role of religion in the lives of Afghan women is profound. Regardless of cultural differences among the many distinct communities throughout Afghanistan, Islam permeates the life of each citizen. In the Western world, the stereotype of a Muslim woman oppressed by her strict, devout society exists with little to no validity. The failure to demonstrate the gender equality that is so vital to Islam that perpetuates the impression of Muslims as antiwoman cannot be attributed to the religion itself. Rather, these inconsistencies lie deep within pre-Islamic cultural norms.

In the media, Afghan women are rarely accurately represented, both within Afghanistan and throughout the Western world. Despite the inadequate portrait of Afghan women's realities, female artists are attempting to bring their truths to the streets of urban areas to make their expressions as accessible as possible to the public.

Women and Islam

Afghan culture is very highly intertwined with Islam; 99 percent of Afghanistan's population is Muslim, and the majority of this demographic actively practices the religion. In accordance with the Koran, the most explicit interpretations of gender relations within Islam promote equality between men and women. Allah holds the two sexes to the same expectations of religious practice. Both men and women must worship, adhere to the customs of high holidays, and demonstrate their devotion to their

faith equally. Prior to the introduction of Islam to Afghanistan centuries ago, the state of gender relations was far worse. By adapting Islamic teachings to a legal code that still stands today, women's rights were naturally integrated into public policy and popular thought.

Koranic interpretations maintain that women hold complete agency over their relationships with the religious teachings. Their demonstrations of faith in Muhammad are unique to individual women. Besides Muhammad, female religious icons also provide women with tenets of worship. Aisha, the third wife of Muhammad, held as much authority over her marriage as her husband. Their relationship provides an example not only of how men should treat their wives with respect but of how women can fulfill their role as wife with grace, as well as other rules of moral treatment between women and men.

Throughout historical Islamic teachings, women are cited as having equal opportunities to participate in Muhammad's teachings in political, military, and social spheres. Some Koranic passages give moral lessons, detailing important concepts of maternal respect, men's support and encouragement of women's goals, and raising both sons and daughters with a solid education. As previously mentioned, women's rights became integrated into culture through the spread of Islam.

Therefore, it is through Islamic law that statutory law finds clear-cut policies for the protection of women's rights. For instance, Muslim women are granted rights to their own possessions and property, including finances. A Muslim woman's inheritance should match her brother's, and her obligations to family care and parenthood are no more pertinent than a man's. They may vote and rally for political change if the need arises.

In interpersonal relationships following Islamic teachings, a man and a woman both need to express equal intent to marry each other. If one part is unwilling or does not provide consent to a marriage, the relationship should not exist. Given these stipulations, divorce is only permitted under extreme circumstances. Additionally, polygamy is only allowed in very rare cases. Koranic verses on this matter specifically outline that a man must be able to fairly handle the financial and emotional support of all his wives and children, even those from prior marriages.

Modesty

Islamic teachings put forth a standard of modesty for women to follow. Koranic verses encourage maintaining

purity within gender relationships, not to suppress women's self-expression but rather to value the mind and spirit over the body. Islam champions the pursuit of intellectual development and wholesome worship rituals. For instance, the customary formation of men praying in front of women is not a statement of male dominance. In the effort to eliminate the objectification and sexualization of women, men are deliberately placed in a position where they cannot stare at women if they look up from prayer.

The most well-known practice of modesty in Islam is the wearing of a hijab. Worn by women, this headscarf contributes to Muslims' devotion to intellectual betterment over physical indulgences. Beyond eliminating sexual objectification of women, wearing a hijab encourages Muslim women to extend their modesty to their comportment. Therefore, it becomes more than just a head covering; for women, the hijab signifies removing the compulsion to behave in any way that may be morally reprehensible. In this way, wearing a hijab can become a feminist statement.

Women take ownership over their bodies. Wearing a veil does not inhibit women's abilities to pursue educational or employment opportunities, nor does it indicate a lack of power. They present themselves modestly as a statement of religious agency.

Perceived Prejudices against Women

Despite the balanced treatment of the sexes in Koranic teachings, devoutly Islamic countries like Afghanistan do not always demonstrate effective implementation of these concepts in society. Because the culture and religion are so connected, it is easy to blame Islam for the mistreatment of Afghan women. However, Islamic teachings never strip women of their rights, nor do they grant men dominance over women. Any prejudices against women that exist in Afghanistan are tied to antiquated cultural norms that differ between urban and rural settings as well as between tribal communities.

Pre-Islamic societies within the area of modern-day Afghanistan upheld patriarchal, misogynistic values. Although the introduction of Islam relieved some of this oppression, problematic cultural norms that disadvantage women have been passed down through generations and have adapted to history. To place the onus on an entire religion, especially when the practice of this religion varies dramatically throughout one country, is hyperbolic. Therefore, when examining instances of cruelty between

Muslim men and women, it is crucial to separate the religion from the executors of its teachings.

Representation in Media and Art

Within Afghanistan, women are oftentimes featured in popular media programs. On television and radio broadcasts as well as in periodicals, they appear as urban, educated, and modern people. Media consumers receive an image of the Afghan woman as one who is a part of the upper class. She wears clothing that pulls from Western fashion trends and is free to travel to and from a comfortable job in a metropolitan setting.

Although such a progressive representation of Afghan women gives off the impression of promoting women's agency in society, the demographic of popular media platforms is vastly rural, poor, and holds traditional values of gender expectations. By showing images of women as only content in their elite positions in society, rural communities are excluded from the encouragement of women's reclamation of their lives. Unequal representation in the media only widens the gap between socioeconomic classes and creates additional obstacles to allowing women in rural areas to feel safe and self-assured in their communities.

Outside of Afghanistan, particularly throughout the Western world, media representation rarely extends further than the negative outcomes of Taliban oppression. In an interview with the *Huffington Post* in 2010, Sadiqa Basiri, founder of the Oruj Learning Center for women's and girls' education, commented that "in the west, there is only one story: burqas" (Yerman 2010). Since the beginning of post-Taliban reconstruction, women have made great strides in resistance, education, medicine, entrepreneurship, and political advocacy. Few of their success stories are as highly publicized as the tragedies. This only inhibits Afghan women's social growth, as it falsely upholds an image of them as helpless against their circumstances.

A small community of Afghan women is rising to fame in the fine arts. To be seen in the aftermath of Taliban rule and Western occupation, various artists have taken to the streets as graffiti artists. Shamsia Hassani, a street artist who has a noticeable presence in Kabul, stated in 2015 that she makes a public display of her feelings "to introduce arts to people, to remove memories of war from the walls of Kabul, to bring back women to the streets for reminding people that women exist in the society, to change the damaged faces of women in the society, and give women a powerful face" (Ahmed 2015).

Issues

As of 2016, engaging in homosexual relationships is a punishable offense in Afghanistan. Between statutory law, sharia, and Pashtunwali, Afghans cannot be safely out publicly or even to their families. It is only within the last couple of years that LGBTQ+ activism has begun within the country.

LGBTQ+ Erasure

The Constitution of Afghanistan currently treats homosexuality as a crime, with punishments ranging from 10 years to life in prison or even a death sentence. According to the Afghan Penal Code of 1976, Article 427, male homosexual relationships, even those between two consenting partners, are punishable by law. This legal persecution is grouped with various types of extramarital affairs and pederasty, pedophilic acts relating specifically to men and boys. There is no mention of lesbian relationships within the legal codes of Afghanistan. Because intimate relationships between heterosexual couples are held to a strict moral code based on the Islamic teachings regarding sexuality, homosexuality is an incredibly taboo topic in religious communities throughout Afghanistan. The Koran contains a brief verse regarding the condemnation of those who commit adultery, which includes the denunciation of specifically male homosexual relationships. Because Afghan legal systems follow Islamic law, the inclusion of this Koranic verse is a major reason for maintaining the statutory law against gay relationships.

In Brian Whitaker's 2006 book on the LGBTQ+ experience in the Middle East, *Unspeakable Love: Gay and Lesbian Life in the Middle East*, he outlines the social stigma surrounding gay relationships. LGBTQ+ youth in Afghanistan cannot freely explore their sexuality for fear of not only the legal repercussions but the possibility of becoming social outcasts and shunned or abused by their families. Some Afghan mental health professionals also claim to provide services to cure individuals of their homosexual tendencies.

Human rights activist Nemat Sadat challenges the traditional idea that not being heterosexual is against Islam. As an openly gay Afghan man, Sadat has dedicated himself to supporting LGBTQ+ movements throughout the Middle East. In 2014, he published an article detailing the advancement of gay rights in Afghanistan. Since the fall of the Taliban regime and the resurgence of more progressive young people vying for human rights, Sadat predicts that

more gay Afghans will feel moved to come out and rally for their rights in the coming years.

Algeria

Overview of Country

Algeria is the largest country in Africa and the 10th largest in the world in terms of land area; it is nearly four times the size of Texas. It lies at the crossroads between Europe, Africa (north and south of the Sahara), and the Middle East. Its population is estimated at 40,263,711 (July 2016), which is more than four times the population at the time of independence in 1962 (CIA 2017). More than 64 percent of this population is under 30 years of age; 49 percent of this population is female. Ninety-one percent of the inhabitants live along the Mediterranean coast on 12 percent of the country's total landmass; 49 percent of the population is urban.

The Algerian Constitution declares Islam to be the state religion. Over 99 percent of Algerians are Sunni Muslim. The remaining 1 percent are Christians and Jews (CIA

2017). Arabic is the official language of Algeria and is used in all institutions, including schools, though French remains the main language of business and scientific education. About a quarter of the population speaks a variety of the Berber language, and most of the population speaks colloquial Arabic, known as *derija*. Algeria depends heavily on its oil and natural gas reserves. Since the 1980s, the country has attempted to move from a socialist to a market economy.

Even though Algeria is only 55 years old as a nation-state, its history dates back thousands of years. Since time immemorial, the area has been inhabited by the native people known as *Imazighen*, which is the original name of the Berbers, whose presence stretches from western Egypt in the east to the Canary Islands in the west, and from the southern Mediterranean shores in the north to the desert plains of the Sahara in the south. The Amazigh (Berber) populations have known a series of invasions and occupations in the last 3,000 years. These invaders included Phoenicians, Romans, Vandals, Byzantines, Arabs, the Spanish, Ottomans, and the French. Despite the ceaseless efforts by each colonizer to eradicate it, the Amazigh culture not only survived but also constituted the foundation on which the other cultural layers were superposed.

First, Phoenician traders settled on the coastline around 1100 BCE. The first Algerian kingdom was established by the Berber chieftain Massinissa, who reigned over the kingdom of Numidia (the ancient name of Algeria) from 202 to 148 BCE. A few decades later, his grandson King Jugurtha continued this legacy but was defeated by Rome a few years later. In the fifth century CE, Algeria was invaded by the Vandals, a Germanic tribe, who stayed on to establish their own kingdom before being driven out by the Emperor Justinian's Byzantine army, whose aim was to restore the Roman Empire. In the seventh century, the Arabs invaded North Africa, bringing with them Islam. This particular conquest has lasted to the present day.

In the late 15th century, Spain captured the coastal cities of Algeria. Later, the Algerians appealed to the Ottoman Empire for help, and thus Spanish control had ended by the mid-16th century. Algeria then came under control of the Ottoman Empire. The French occupied Algeria in 1830 and made it a part of France in 1848. By 1880, about 375,000 people of European descent controlled most of the better farmland. On November 1, 1954, the National Liberation Front (FLN) declared war on the French. After more than seven years of fighting, Algeria became independent in 1962.

Throughout this entire history of occupation and resistance, Algerian women have always played a key role. For example, Kahina, the legendary Berber queen, led her armies for several years against the Arab conquest in the 7th century CE. During the French conquest of Algeria in the mid-19th century, Fadhma N'Soumer, known as the Berber Joan of Arc, led military resistance against the French. More recently, women made an immense contribution in the Algerian War of Independence (1954–1962). Hassiba Ben Bouali, Djamila Bouhired, and Zohra Drif, as illustrated in Gillo Pontecorvo's famous film *The Battle of Algiers* (1966), were instrumental in this struggle for independence. In the film, we see them remove their veils and dress up like fashionable French women to sneak past checkpoints and plant bombs in public places. While the film focused only on the capital city, Algiers, the war took place in other regions as well, especially in the mountains where women also played important roles as nurses, cooks, messengers, and secretaries, among other duties.

The National Liberation Front (FLN), which has ruled the country since independence, has been ambivalent about women's issues. The liberal side promotes women's rights, especially after considering their contributions during the war. The conservative side, based mostly on Islamic and traditional beliefs, wants limited rights for women and has become the resistance force against any advancement of gender equality. In fact, in 1981, this conservative branch managed to draft a very retrograde family law that advocated far fewer rights for women. Thanks to pressure from different women's movements, the government retracted the law. However, only three years later, the government, under pressure from conservative Islamist elements, imposed a similar family code, this time without any consent or public debate. The Family Code, passed on June 9, 1984, is mainly based on Islamic (sharia) law and established patriarchal authority. This law immediately affected women's rights in terms of marriage, divorce, child custody, and inheritance, among other matters.

In the 1990s, Algeria knew one of its most tragic periods in history. As a result of the government's cancellation of the national elections in 1991, which the FIS (Islamic Salvation Front) was about to win, it is estimated that 200,000 people died during what is known as the "black decade." As retaliation to the government's defiance, the Islamists took up arms and started a civil war that lasted until early 2002. Most of the victims were men, but many women, particularly those leading Western lifestyles, suffered from rape, kidnapping, and murder. In addition, most of the

men who died or disappeared left widows and children behind, most without any resources or protection.

After this tragic decade, women's rights organizations were created across the country, especially in urban centers, and showed increasing engagement in the struggle for more women's rights. Several grassroots movements and political parties, such as Louisa Hanoune's Party of Workers, have been fighting to eradicate the Family Code and replace it with more secular civil laws. However, despite these advancements, several challenges are still ahead. In addition to the government's tight control over gender equality, ideological divides exist between the various women's rights groups. This obviously prevents a more cohesive and broader movement to take shape. Finally, there is still work to do in terms of both raising awareness about women's rights across the country and having more women engaged in this continuous struggle.

Health

After independence in 1962, Algeria followed the socialist system, hence providing Algerians with a free universal health care. According to a UN report, child mortality decreased significantly thanks to a government program to combat childhood diseases (United Nations 2000). At the time of independence, child mortality was 200 per 1,000. Forty years later, the rate had dropped to 34.5 per 1,000 (2002). Children and teenagers also receive some health services through school programs.

According to Nadia Marzouki's report, Algerian women generally have the freedom to make decisions about their health and reproductive rights (Marzouki 2010). They receive free prenatal care in public health facilities, and while private clinics have been popular, especially in the past 20 years, most women give birth in public health centers, despite the increasingly poor conditions in most facilities. Those who are married also have access to free contraceptives in public health centers. Abortion remains illegal in Algeria under Articles 302–313 of the Penal Code, with exceptions for cases of maternal physical or mental health. Mothers who have children out of wedlock face social prejudice and poverty issues. While they too have access to basic service in public hospitals, they do not usually benefit from the same treatment as married women.

According to the same report, Algeria has implemented maternal and child welfare programs in more than 5,000 public medical centers across the country—all free of charge (Marzouki 2010). In collaborating with UNICEF,

Algeria has also been promoting the care and well-being of mothers and children.

Algeria has low HIV rates, but tuberculosis and cholera remain challenges in overcrowded areas lacking clean water. The influx of oil money is contributing to rising rates of heart disease, cancer, and diabetes, which has shifted focus in recent years to health conditions more common in “richer” countries.

Education

At the time of independence, less than 5 percent of Algerian women knew how to read and write. Article 53 of the Algerian Constitution declares that education is free and mandatory for boys and girls between the ages of 6 and 16. According to *CIA World Factbook*, the ratio for literacy is 87.2 percent for males and 73.1 percent for females (CIA 2017). Interestingly enough, the survey also shows that a higher percentage of girls, as compared to boys, went on to secondary and postsecondary education. According to another report, primary school attendance rates are very high for boys (94%) and girls (93%) in Algeria (UNICEF 2007).

Despite these positive numbers and the relative success of girls in the education sector, certain areas still have high illiteracy rates for women. According to a study, 34 percent of women in rural areas have never attended school (World Bank 2015). Consequently, in 2009, the government decided to launch a national campaign to eliminate illiteracy by 2015. Several women’s groups, such as Horizons for Algerian Women, have also implemented education programs throughout the country. Women have benefited from these educational programs.

Women’s rights organizations have also been trying hard to eradicate patriarchal and archaic stereotypes, especially in schools, as these negative images still exist in textbooks.

Employment

Women’s employment in Algeria has benefited from the progress made in recent years in Algerian society. Article 84 of the employment code of 1990 stipulates that men and women with equal qualifications and tasks must be paid equally and that employment contracts cannot discriminate based on gender. Employers are required to provide three months of paid maternity leave as well as equal retirement benefits. Under the law, men’s retirement age is

60, whereas the retirement age for women is 55, and could be even less if she has children. Women can receive one year of early retirement for each child (up to three children) if she raised them for at least nine years. In addition, the employment code stipulates that “any provision in a convention or collective agreement or in an employment contract which establishes any kind of discrimination between workers & based on gender & is null and void” (Article 17). Articles 142 and 143 list the sanctions in cases of discrimination.

The labor law provides gender-specific rights for women, such as maternity leave (Article 55), exemption from night work (Article 29), and special retirement provisions (Article 6). Both state employers and private companies are required to provide such benefits, including two hours a day for breastfeeding and three months of paid maternity leave with benefits. Child care services are offered in some of the largest state companies, but to remedy the huge need, public and private child care centers have also been created in recent years.

Marriage remains a common obstacle to women’s employment. According to a 2006 national survey, 49 percent of women in the private sector quit their jobs after marriage, compared to 16.3 percent in the public sector. Among the factors that discouraged women from staying in the labor force, the surveyed women listed family pressure, transportation issues, wages, child care shortages, discrimination, and sexual harassment (Marzouki 2010).

Despite this issue, recent years have witnessed an increase in the number of female employees and independent women workers. By law, Algerian women have the right to choose the profession they want. But again, the Family Code and its clause of “duty of obedience” permit the husband to oppose the wife’s choice of a profession. Currently, women represent more than 27 percent of the labor force (Sakina Brac de la Perrière 2005), and they occupy important economic decision-making positions in such organizations as the Bank of Algeria, the Council of Currency and Credit, and the commercial sector of SONATRACH, the largest state-owned company. Women are also present in other sectors of employment, such as the police and the military. In urban areas, some even work as taxi drivers. But most women tend to pursue so-called feminine professions, such as health and education, which are considered more socially acceptable. They also make their career choices based on the conditions of their family life. Child care and domestic duties are still primarily the woman’s responsibility despite the changing society.

In 2002, the National Committee of Working Women established a center to help victims of sexual harassment in the workplace. Women unionists and employees of the National Institute for Public Health have also been campaigning for a law that protects more women from sexual harassment in the workplace. In 2004, the penal code was amended to criminalize sexual harassment, but to the dismay of most women activists, this amendment is quite limited, as it only addresses abuse of authority and leaves other types of abuse unaddressed. In general, single, divorced, and widowed women are the most vulnerable victims of harassment. Victims usually refrain from filing suits for fear of being fired, countersuits that accuse them of defamation, scorn from family and colleagues, and threats. Others do not complain simply because they do not know their legal rights.

Family Life

Since independence from France in 1962, criminal and civil law in Algeria has primarily been based on French legislation. However, when it comes to issues of citizenship, nationality, and family life, it is Islamic law that is used. This creates an ambiguous situation as far as women's rights are concerned. For example, Article 29 of the Constitution reads, "All citizens are equal before the law. No discrimination shall prevail because of birth, race, sex, opinion, or any other personal or social condition or circumstance." Yet, Article 2 of the same Constitution states that Islam is the religion of the state, and, consequently, several laws (particularly those pertaining to women's rights) are based on religion. Some conservative politicians have actually been trying to use Article 2 as a pretext to implement and maintain discriminatory practices against women.

Family Code

The real battle over the status and rights of women has been the Family Code, which is a set of legal provisions regulating marriage and the family. The debate was between those who wanted family life organized along Western secularist lines and those who wanted to impose a family structure conforming to Islamic principles and ethics. The Family Code was proposed, discussed, and shelved at least three times over a period of two decades before being adopted as law in 1984. In 1981, the code's provisions provoked huge opposition from female members of the National People's Assembly and women in the streets of Algiers.

Although some of the 1984 code's provisions are more liberal than those of the 1981 version, the code essentially reflects the influence of Islamic conservatives. The family unit is "the basic unit of society," and the head of the family is the husband, to whom the wife owes obedience. According to sharia, a Muslim woman may not marry a non-Muslim; polygyny is permitted under certain conditions (although it is rarely practiced); and women do not inherit property equally with men. A woman cannot be married without her consent, and she may sue for divorce in specified circumstances, including desertion and non-support. In divorce cases, custody of children under age seven passes to the wife, but it reverts to the husband when the children are older. Divorce rates have risen steadily since independence, but divorce remains much easier for men than for women.

Due to ceaseless efforts by feminist NGOs, a Ministry of Women's Affairs was created in 2003, allowing for more advantages for women. After pressure from women's rights organizations, President Abdelaziz Bouteflika revised the Family Code in 2005, which helped ease discrimination against women. However, most of these women's organizations believe that more efforts need to be made. The Family Code is still the main obstacle for gender equity. It clearly states that men and women are not equals within a marriage, explicitly stating, "The duty of the wife is to obey her husband." Wives are minors under the authority of their husbands and must stay at home.

In practice, most women, especially in urban areas, do not adhere to this law anymore. In theory, a married woman needs to have her husband's permission to work outside the home, but in reality, the number of women in the workforce has grown considerably, demonstrating increased independence within their households.

According to Article 8 of the Family Code, polygamy is permitted. Sharia law allows Muslim men to take up to four wives. Because of code amendments and progress in Algerian society, polygamous marriages are becoming increasingly rare. To have a polygamous marriage, a man must not only make an application to the family court for permission but also obtain the consent of both the first and the proposed second wife. The court then decides based on the husband's reasons and his ability to provide for both wives. According to Nadia Marzouki's report, 3 percent of households in Algeria are polygamous (Marzouki 2010). More importantly, women now cannot be forced to marry against their will.

A major victory by the women's movement was the Khemisti Law, which was drafted by Fatima Khemisti,

How Can I Join the Fight against Human Trafficking?

The Polaris Project

The Polaris Project was established on February 14, 2002, by two seniors at Brown University. The central goal of the organization was to create long-term solutions that would effect systemic change within the underlying systems that perpetuate human trafficking. They also believed that human trafficking should be viewed as a market-based phenomenon driven by two main factors: low-risk activity and high-profit margin. Unlike drugs, human bodies can be used again and again. In 2007, the Polaris Project expanded the National Human Trafficking Resource Center to create a national hotline (888-373-7888) that anyone could call or text—whether you were a victim or someone that just wanted information on how to end human trafficking. The organization focuses on six main areas in their fight against human trafficking: client services, policy advocacy, training and technical assistance, global programs, fellowship programs, and the National Human Trafficking Resource Center. Bradley Myles is the chief executive officer of the Polaris Project, which is based out of Washington, D.C. For more information on the Polaris Project, please visit their Web site at www.polarisproject.org.

Network against Human Trafficking

The Network against Human Trafficking (NAHT) was established to coordinate Iowa's solution to end human trafficking through building relationships with other like-minded organizations, raising awareness of human trafficking with the state and around the country, providing education, and promoting advocacy. The work of the network is supported by a variety of affiliate groups, including Youth and Shelter Services, the University of Iowa Center for Human Rights, the Iowa Civil Rights Commission, the Iowa Commission on the Status of Women, the Polaris Project, the Coalition to Abolish Slavery and Trafficking, the Iowa Department of Public Health, Planned Parenthood of Greater Iowa, the Iowa Department of Human Services, and the Iowa Law Enforcement Academy, among many others. Dr. Teresa Downing is the executive director of the Network against Human Trafficking, which is based out of Ames, Iowa. She is also a lecturer of sociology at Iowa State University. For more information, please visit NAHT's Web site at www.iowanah.org.

National Indigenous Women's Resource Center

The National Indigenous Women's Resource Center (NIWRC) was established to address the issues of domestic violence perpetrated against American Indian, Alaskan Native, and Native Hawaiian women. The mission of the organization is to restore safety to Native women by upholding the sovereignty of Indian and Alaskan Native tribes. Through the areas of public awareness and resource development, training and technical assistance, policy development, and research, the NIWRC will advocate that Native women and their children are safe from violence in their communities and have the freedom to access services based on their tribal beliefs and practices. Lucy Rain Simpson is the executive director of the National Indigenous Women's Resource Center, which is based out of Lake Deer, Montana. For more information, please visit their Web site at www.niwrc.org.

—Alissa Stoehr

the wife of a former foreign minister, and presented to the National Popular Assembly (APN) in 1963. This law raised the minimum age of marriage to 16 for girls and 18 for boys. Since the Family Code act was enacted in 1984, the minimum legal age for marriage is now 18 for women and 21 for men. However, early marriage is still prevalent in rural areas where family traditions prevail. According to a report, the average age of marriage for women is now 29.9, and it is increasing annually in both urban and rural

areas. According to UNICEF, in the Middle East and North Africa (MENA) region, Algeria has the lowest percentage (2%) of young women who were married before their 18th birthdays (CEDAW 2010).

As far as divorce is concerned, the Family Code favors men, at least in principle. For instance, men can divorce without any justification, whereas women can obtain a divorce only under certain conditions. However, the new Family Code stipulates that when a divorced couple has

children, decisions regarding custody should be made in the best interests of the children. In general, custody is now granted to the mother, and the father is required to provide financial support. More importantly, in all divorce cases, judges in family courts are now legally obliged to persuade the couple to reconcile.

Provisions in the previous Family Code whereby men who obtained a divorce had the right to keep the family house and immediately evict their wives and children have been removed, although the new code only appears to allow the children (and by extension their mother) to remain in the family home until such time as the husband has made alternative arrangements to lodge them elsewhere. If a woman remarries, she loses custody of her children. According to the 2010 Freedom House report, despite relative progress, single and divorced women still face marginalization (Kelly and Breslin 2010). Finally, another amendment was made to the Nationality Code in 2005, which gives Algerian women who are married to non-Algerian citizens the right to pass Algerian citizenship on to their children.

Under sharia law, women's inheritance is half that of men. Because of traditional values, women usually have limited access to land ownership. Even though the law allows them to own their share of land (or any inheritance for that matter), it is usually not appropriate for married women to possess it. However, there has recently been a growing refusal among Algerian liberals (called *progressistes*) to accept unequal inheritance rights, as stipulated by this discriminatory law. For example, they often find ways to go around this obstacle by using gifts or donations to make up for the inequality.

In general, Algerian women have freedom of movement. However, this freedom always depends on their husbands, who have the right to control it. For unmarried women, it is usually the father or the older brother who exerts that control. Similarly, women have the legal right to access bank loans, keep their wages, and own personal possessions, but the husbands have the right to control the management of these properties. The Algerian Family Code prevents married women from enjoying full freedom of movement, as the husbands usually have the final say in decision making. For example, if the wife's job is too far away or involves night shifts or long hours, the husband can refuse to allow her to work. Because of the recent transformations in Algerian society (economic difficulties, rising costs of living, etc.), more and more women work, especially in urban areas.

Historically, an Algerian wife lived with her husband's family, which often included grandparents, aunts, widowed and unmarried daughters, and children. In the past few decades, there has been a trend toward the smaller nuclear family, although many families still have seven or more children. More and more couples shy away from the extended family structure, especially in urban areas. The nuclear family is becoming the prevalent family structure in Algerian society due to urbanization and wage labor, among other factors.

Algeria ratified the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) in 1996, but it opposed several articles that were in contradiction with the Family Code, such as Article 15 (4) on freedom of movement and residence and Article 16 on marital and family rights.

Politics

Algerian women have had the right to vote and run for office since 1962. In fact, Louisa Hanoune (the leader of the Workers' Party) has run in several presidential elections since 2004, but each time she finished far behind the winner, Abdel-Aziz Bouteflika, who is currently serving a fourth term in office, despite his failing health and the limitation of terms as set by Algeria's Constitution, which he revoked few years ago. The National Union of Algerian Women (UNFA) was created by the government in 1962 and held its first march in Algiers on March 8, 1965, to celebrate International Women's Day, in which nearly 6,000 women participated.

The National Popular Assembly (APN), which was created at the time of independence by the ruling party, known as the National Liberation Front (FLN), was another place available for a women's rights agenda. But following the military coup in 1965 and the suspension of the APN by Colonel Boumédiène, access to this forum was taken away. No female members were elected to the APN under Ahmed Ben Bella, the first president of Algeria, but women were allowed to propose resolutions before the assembly (such as the Khemisti Law). In the years following independence, there was not one woman in any of the key decision-making bodies, but nine women were elected to the APN when it was reinstated in 1976. At the local and regional levels, however, women's public participation rose significantly.

While there are currently several women serving in the Algerian government, more remains to be done in terms

of representation. A third of the country's prosecutors and judges are women, but very few women work in the executive branch. For example, among the 35 members of the current government cabinet, only 7 are women. Women's participation in the parliament is estimated at 32 percent (World Bank 2016).

Women do participate in the country's political parties, but their membership remains minimal. In April 2009, the Ministry of Justice considered a law that would set a quota of 30–40 percent for women in all political parties. A number of politically engaged women were not happy with this plan, arguing that the number of women within political parties should not be the sole indicator of women's political empowerment and that the agenda of each party should be taken into account. For example, Islamist parties generally have more female members than secular parties, but these women often adopt a very conservative stance on gender equality (Marzouki 2010).

Religious and Cultural Roles

Sexuality

Homosexuality is criminalized in Algeria in Section 6 of the Penal Code and punishable by imprisonment and fines. Therefore same-sex marriage is illegal, and discrimination based on sexual identity is allowed. Unfortunately, this marginalization leads many LGBT women to lead double lives, sometimes even bowing to family pressure and marrying a man to avoid being ostracized. Resistance and community can be difficult in these circumstances, but online sources help connect people. *LeXo Fanzine*, a mini-magazine for Algerian lesbians, is an example of online activism to counter misinformation and safely connect with other women.

Veiling

There is no law requiring women to cover their heads in Algeria. Throughout recent history, the veil has come to symbolize a variety of ideals, from freedom from colonizing France and resistance to Western ideals to adherence to religious beliefs. It is rarely worn by women in official, government, or media positions, but various kinds of coverings are worn by Algerian women in both urban and rural areas. There is a call by some to return to wearing a *haik*, the traditional Algerian veil, rather than the *hijab* or *djellaba* imported from the Middle East in the 1990s.

Issues

Security

Algeria's civil war of the 1990s proved to be a very dark and tragic period for Algerian women in particular. Islamic extremists who had focused their attacks on government officials and intellectuals began to target women as well, particularly the ones who did not wear a veil. The mass slaughters, mostly in villages, appeared random and savage, and the government was incapable of containing this violence. Some people even suspect that the army looked the other way while civilians were being killed. Algeria refused international mediation and kept the outside world largely in the dark about this civil war.

During this decade of violence, thousands of women fell victim to abduction, rape, and murder by armed fundamentalist groups. Unfortunately, many of the women who survived this tragedy but experienced sexual violence during this war were subsequently abandoned by their families and even by the state. The official policy of "national reconciliation" of 2005 has seen amnesty granted to those who committed human rights abuses, including acts of sexual abuse and rape. Sadly, there has never been any official attempt by the state to delve into this violence and bring some justice to the victims.

Fortunately, these attacks have decreased significantly since 2000. However, women still remain vulnerable to all types of violence. In 2001, for example, a group of citizens beat and tortured about 50 women in the southern city of Hassi Messaoud. The police and security forces were said to be slow to intervene and to implement a serious investigation of the attack. Some of the men who attacked the women were arrested, but those who were actually sentenced to serve short terms in jail were not convicted of rape. It was claimed that the women victims were not able to provide the required medical evidence to support their claims of rape and violent sexual assault. Women's rights groups in Algeria have been active in demanding justice for the victims. The intensive coverage of this event by the press led the Ministry of Solidarity and other official institutions to express their support for the victims, but this led to little change in justice for the victims.

Domestic Violence

Article 24 of the Constitution declares that the government must protect all its citizens. Yet, women remain vulnerable to different forms of violence than men, especially domestic abuse, which is not prohibited by law. It is considered as

a private matter, which makes it difficult to combat at the legal level. As cited in Nadia Marzouki's report, one women's rights activist states, "Women escape the protection of the law and men escape the sentence of the law" (Marzouki 2010). According to Marzouki, women tend to avoid filing complaints to the court for fear of incurring further violence or facing hostile judges.

A 2006 national survey by the Ministry in Charge of the Family and Women's Affairs concluded that at least 10 percent of the female respondents were exposed "daily" or "often" to physical abuse, while 31.4 percent were regularly exposed to threats of violence (Marzouki 2010). These figures, Marzkouki adds, are generally considered to be much lower than the actual occurrences of domestic violence.

Despite all the efforts by women's rights associations, such as Children of Fadhma N'Soumer and Wassila Network, to eradicate domestic violence, it remains an important social issue. There are several reasons for this problem. First, the Ministry of the Interior tightly controls most of the associations. Second, most women's rights organizations do not always agree on content and approach. Instead of being united for a common fight, they tend to disagree, especially when it comes to the clash between secular and religion-based ideologies. In addition, these organizations' main challenge is to find the necessary funding for their programs. Moreover, many women, especially in rural areas, are generally unaware of their rights.

Algerian women's rights groups have been advocating for changes to the Family Code for decades, and as a result, a draft reform introducing the concept of equality between spouses in certain articles is to be presented by the government to the National Assembly in 2015. However, many women's rights advocates believe that the new draft remains nonegalitarian, and they continue to advocate for additional reforms to the code.

B

Bahrain

Overview of Country

The Kingdom of Bahrain is a small island nation situated just east of Saudi Arabia in the Persian Gulf. The Bahraini archipelago is composed of 33 small islands that cover a total of 277 square miles, with the main island being connected to Saudi Arabia by the King Fahd Causeway (Gordon Smith 2013). The capital of the nation is Manama, a city located on the main island with a population of about 262,000. Since the 1980s, Bahrain's population has exploded, and the country has seen a dramatic increase of foreign migrants. Due to rapid growth in the mid to late 20th century, thousands of migrants from neighboring and distant countries have filled low-wage jobs. Bahrain grew from 419,000 people in 1985 to 1.3 million in 2013 (Department of Economic and Social Affairs 2013). The country is split between ethnic Bahraini nationals, comprising 46 percent, and immigrants making up the other 56 percent. Islam is the country's official religion, representing 70.2 percent of the population, but there is tension between the Shia majority and the ruling Sunni minority. Arabic is the official language, but due to Bahrain's international population and seat as a world banking center, English is widely spoken as well (CIA 2014).

Bahrain's modern economy has been shaped by the discovery of oil in 1932. Prior to this, sea trade and pearl

diving were the strongholds of the economy (Al Arrayed Shirawi 1989). As only 3 percent of Bahrain's land is arable, the country developed a long history of international trade as a way to sustain itself. Although the oil industry was and still is quite profitable, Bahrain knows that it has limited reserves and expects to be the first of the Gulf region countries to exhaust its supply. Because of the limited oil reserves, Bahrain has developed one of the most diversified economies in the Gulf region (Gordon Smith 2013).

Due to Bahrain's central location in the Gulf, historically many outside powers have vied for its control. The Persians, Omanis, Dutch, French, and British have each dominated or ruled Bahrain at various times. In 1971, Bahrain gained full independence from the British, placing the country under the rule of the Al Khalifa family, with Shaikh Isa bin Salman Al Khalifa as the leader (Gordon Smith 2013). Two years later, the first constitution was drafted, and a parliament was established. However, political tension led the king to disband the parliament and place the country under a state of emergency from 1975 to 2002. During this time, the head of state had the right to suspend and change the rights and powers of the government and the people of Bahrain. Following the death of his father, Hamad bin Isa Al Khalifa took the throne in 1999 and continued to rule into 2017.

In 2001, when King Hamad signed the National Action Charter (a wide-ranging set of reforms), he assured the public that future reforms would be subject to public consultation. However, not long after, the king promulgated a new

constitution in 2002 without consulting the public, upsetting many political activists. This new constitution established Bahrain as a constitutional monarchy with sharia law (Islamic law) as the principle source for legislation and a government whose powers are divided among the king, the prime minister, the council of ministers, a bicameral national assembly, and a Constitutional Court (National Democratic Institute for International Affairs 2002).

On February 14, 2011, influenced by the popular unrest starting in Tunisia and spreading across North Africa and the Middle East, thousands of Bahraini people took to the streets to demand political reform and greater political participation. The protesters gathered around the Pearl Roundabout monument in the capital of Manama, challenging the governmental discrimination faced by the Shia majority. The government responded violently, leading to the death of one protester on the first day and hundreds more in the months to come. King Hamad declared the country under a state of emergency law, displacing many rights of its people (Marlowe 2012). Since 2011, various sources have reported human rights violations by King Hamad's regime. In 2014, political unrest was still present in Bahrain, and protesters continued to take to the streets, demanding reforms that the government has refused.

Girls and Teens

Education

Before the turn of the 20th century, girls in Bahrain had little opportunity to be educated outside of the home. After the age of 10, girls, particularly from upper-class families, were forbidden to leave the home and took no part in working in the public sphere (Al Arrayed Shirawi 1989). It was widely believed that educating one's daughter to read and write was dangerous, but some girls did receive tutoring from their fathers, particularly in the form of reciting the Koran (Pandya 2012). However, it was common for working-class Bahraini women to leave the house to work or socialize while their husbands were out pearling (Pandya 2012). In 1919, the first government-sponsored school was established for boys, and nine years later, one opened for girls (Al Arrayed Shirawi 1989). Although some conservative religious leaders originally opposed the school, within a few years several more schools were established (Al Arrayed Shirawi 1989). Today, the Kingdom of Bahrain requires that all children between the ages of 6 and 14 be enrolled in school. The government offers free universal education through high school (Embassy of the Kingdom of Bahrain 2014).

During the early years of public education, the curriculum taught at girls' schools did not differ much from that of the boys', except that girls were taught some nursing skills, sewing, knitting, and embroidery. The girls were taught similar core subjects, but the objective of their education was not that of preparing women for the working world because there was no employment for women at the time. Girls were expected to stay in school until the age of marriage. Public education for girls was aimed at bettering their housekeeping skills and preparing them to raise children. Despite generally subpar educational opportunities, a few women received scholarships to go to foreign colleges during the 1950s. This number steadily increased due to the changes to education system in 1963 that required girls' high schools to offer curriculum that would prepare them for admission to universities (Seikaly 1994, 420).

Today, girls and women have matched and surpassed their male counterparts in many levels of education. According to a report by the Supreme Council for Women, the illiteracy rate for girls between the ages of 15 to 24 is only 0.4 percent (2013). This is a tremendous improvement from the literacy rate of 20 percent recorded in 1978 (Seikaly 1994). The percentage of women with a high school degree or higher is now at 57 percent, equal to that of men. Due to their higher performances on high school final examinations, girls are also more likely to receive merit-based scholarships. Women also have a commanding presence in higher education, making up 61 percent of university students (General Secretariat 2013). Although women have made tremendous strides in education, they are still guided into typically gendered careers such as teaching and nursing and are underrepresented in fields such as engineering (Ahmed Abdulla Ahmed 2009).

Extracurricular Activities

Several institutes in the Kingdom of Bahrain offer extracurricular activities, such as sports, music, dance, horseback riding, and martial arts. Girls' participation in these activities is not well studied in the literature and needs further investigation.

Health

Access to Health Care

Life expectancy is higher in Bahrain than other countries in the region. For women, it is 78 years; for men, it is 76. Twenty-one percent of the population is under 15 (WHO

2015), and 89 percent of the population lives in urban areas. Improved drinking water and sanitation facilities are available to nearly 100 percent of the population (UNICEF 2017). There is nearly one physician for every 1,000 persons (CIA 2014).

Maternal Health

The fertility rate in 2013 was 2.1 children per woman (WHO 2015). In 1995, 61 percent of women were using a modern form of contraception; more recent data are unavailable (United Nations 2009). Contraceptives are free, and sterilization is readily available. Bahrain is proud of its advanced health care system, and it was the first in the region to offer official family planning services. The maternal mortality rate was 22 per 100,000 in 2013, and the morality rate for children under five was 6/1000 in 2013 (WHO 2015). Nearly 100 percent of women attend four or more antenatal appointments, and 100 percent are attended by a skilled birth assistant for delivery (UNICEF 2017). Prematurity is the leading cause of death for children under five. Bahrain has high vaccination rates, and 99 percent of children are immunized against the measles (WHO 2015). Abortion is only illegal if self-induced or performed without the woman's consent.

Diseases and Disorders

The leading causes of health risk for women in 2013 were high blood pressure, diabetes, and cardiovascular disease. HIV and malaria are not common in Bahrain (WHO 2015).

Employment

Typical Careers and Jobs

Careers and jobs women occupy in Bahrain are highly influenced by the historical context of employment in the country. In the pre-oil era, men were almost exclusively engaged in the two main economic activities in the country: pearl diving, and sea trading. During this period, women and girls were responsible for the home and supported their families through agricultural work and performing services, such as being water and household item vendors (Al Arrayed Shirawi 1989). After the discovery of oil, immigration rates rose to fill employer demands.

Traditional gender roles continue to influence Bahraini women's participation in the labor market. In modern Bahrain, women continue to perform traditionally

feminine jobs, such as teaching, nursing, secretary work, low-level government jobs, and banking (Pandya 2012). In 2013, women were 33.5 percent of the total workforce, representing 46.8 percent of the public sector and 29 percent of the private sector (General Secretariat 2013). Women make up 76 percent of teachers in primary education and 54 percent in secondary education (World Economic Forum 2013).

Discrimination and Income Disparity

The Labor Act (No. 23 of 1976) theoretically guarantees equality of all employees; however, the Penal Code (No. 15 of 1976) does not outline any provisions that would punish individuals found guilty of discrimination against women (Ahmed Abdulla Ahmed 2009). Women face both subtle and blatant forms of discrimination in the labor force. Subtle forms of discrimination occur in career choices. Female students in Bahrain tend to specialize in fields that prepare them for work in government jobs, such as teaching, that allow them to harmonize their family and work duties, reinforcing traditional family gender roles. An example of blatant discrimination took place in 2001–2002. Media attention focused on a group of female university graduates in the field of chemical engineering who could not obtain jobs suitable to their qualifications in the private sector. The Bahraini Assembly for Human Rights proclaimed this a case of employment gender bias. However, because there are no labor laws that address this specific issue, nothing could be done (Al Gharaibeh 2011).

On average, women earn 76 percent of the income of a male worker in a similar job. Reports have also shown that gender stereotyping has a negative effect on the opportunities women have for promotions (Karolak 2014). Women are more likely to be unemployed. According to the *2013 Global Gender Gap Report*, 20 percent of the female labor force is unemployed, compared to 6 percent of the male labor force.

Labor Regulations

Bahraini women face a number of gendered labor laws that restrict their access to work. For example, the Private Labor Law (No. 63 of 1976) constitutes that women are prohibited from working between 8:00 p.m. and 4:00 a.m., with some exceptions, such as jobs in health care (Ahmed Abdulla Ahmed 2010). Another law, issued in 1977, prohibits women from working in hazardous environments,

Women's Voices

Maryam Abdulhadi al-Khawaja

Maryam Abdulhadi al-Khawaja comes from a family of activists. She fights for human rights in the Persian Gulf nation of Bahrain. In 2014, she was sentenced to one year in prison for assaulting a police officer; in reality, she was the one assaulted. Speaking about her sentence, al-Khawaja said, "This sentence is not going to affect my determination to continue working on human rights issues" (Amnesty 2014). She uses social media, especially Twitter, to aid her activism, often drawing attention to human rights violations not only in her home country but in other countries in the Gulf as well. You can follow her on Twitter at twitter.com/maryamalkhawaja.

—Melissa Jacobs

Amnesty International. 2014. "Bahrain: Maryam Al-Khawaja Remains Defiant after in Absentia Prison Sentence." December 1. Retrieved from <https://www.amnesty.org/en/latest/news/2014/12/bahrain-maryam-al-khawaja-remains-defiant-after-absentia-prison-sentence>.

including heavy industrial work (Ahmed Abdulla Ahmed 2010).

In recent years, some gender-based improvements have been made to labor laws. For example, in 2005, a guaranteed maternity leave was increased from 35 to 60 working days, breaks for breastfeeding increased from one to two hours a day for a six-month period, and mothers can now obtain an unpaid leave for two years at a time on three separate occasions during their working lives (Ahmed Abdulla Ahmed 2010).

Family Life

Marriage and Fertility

Traditionally, arranged marriages are the norm in the Gulf countries; dating is nonexistent. A marriage is seen as a family and a business agreement rather than purely an expression of love. Marriages between cousins are common in traditional practices, but this is changing with younger generations. Once the prospective bride is found, the father of the groom arranges a bride-price, or dowry (*mahr*), with the family of the bride to be. If the woman and the family accept, then the dates are arranged for the religious and social ceremonies to come (Faier 2009). The next step is a premarriage medical exam in which the main objective is to reduce common hemoglobinopathies, such as sickle cell anemia and thalassemias (Al Hajeri n.d.). If the medical test clears and no objections are made to the marriage, then the couple elopes and leaves for a honeymoon (Faier 2009).

Prior to 2007, there was no established legal age for marriage; today, the legal age for girls is 15 and 18 for boys (SIGI 2014). Marriage between the ages of 15 and 19 is relatively infrequent, accounting for only 4 percent of documented marriages (World Economic Forum 2013). A 2010 report from the Bahraini government estimates the median marriage age for women is 22.1 years old, and for men it is 25.5 (General Secretariat 2013).

Over the past few decades, fertility rates have steadily declined. In 1985, the overall fertility rate was 4.6 children per woman, with an adolescent birthrate of 52 for every 1,000. In 2013, the fertility rate has declined to 2.1 children per woman, and 14 for every 1,000 births by adolescents (Department of Economic and Social Affairs 2013).

Divorce

According to the Bahraini government, the divorce rate in 2012 was 58.1 percent (General Secretariat 2013). Most of these divorces are likely to have been demanded by the husband due to the difficulties women face in seeking divorce. Men have the right to divorce by simply orally announcing it or recording their intent, depending on whether the couple is Shia or Sunni. On the other hand, women must seek a judicial divorce based on very narrow reasons, such as desertion or impotency. The judicial divorce process is very slow and can take up to 10 years (Ahmed Abdulla Ahmed 2009).

A woman may also initiate a *khula*, or the Islamic practice of a divorce initiated by a woman in which she is required to repay her dowry. In some cases, men abuse

the *khula* and demand the wife compensate for all the husband's expenditures on her during their marriage (Ahmed Abdulla Ahmed 2009).

Custody of children depends on whether the couple is Shia or Sunni. According to the Family Protective Act of 2009, Sunni women retain custody of their daughters until they are married and their sons until they are of legal age. Because Shia are not protected under the act, Shia women lose custody of their sons at the age of seven and their daughters at the age of nine (Ahmed Abdulla Ahmed 2009).

Sexuality

A girl's virginity is closely tied to a family's honor. In fact, it is illegal to have heterosexual relations outside of marriage in Bahrain (Foreign & Commonwealth Office 2014).

Homosexuality is legal in Bahrain between two consenting adults of at least 21 years of age. However, lesbian, gay, bisexual, and transgender activities are not socially accepted, and discrimination is common (U.S. Department of State 2011)

Household Roles and Responsibilities

Women are responsible for all internal household labor. Depending on the socioeconomic class, some women subsidize their work by hiring an inexpensive foreign domestic laborer. A majority of female foreign workers become domestic laborers. These women are often subject to unfair working conditions and abuse.

Women's roles in the family are influenced by a variety of factors, including the level of education, socioeconomic standing, religious sect, urban or village background, and degree of contact with the West. Commonly, traditional values place women in the home as housewives and mothers; women take care of the children, cook, clean, and perform household chores. Only 2.9 percent of households are headed by women (General Secretariat 2013).

Unmarried women typically live with their parents and are expected to care for the elderly and sick in the family. If the parents are no longer living, a woman may live with a male relative. In recent years, it has become more permissible for a group of related women to live together without a male relative. However, it is socially taboo for a woman to live alone (Ahmed Abdulla Ahmed 2010).

Inheritance

Islamic sharia law governs inheritance, and interpretations of the law can vary depending on whether the family is

Sunni or Shia. Generally, under sharia law, women may inherit from their fathers, mothers, brothers, husbands, and children, but their shares are smaller than men's. In the absence of male children, daughters can fully inherit their father's estate under Shia ruling, while Sunni daughters are obliged to share with other paternal relatives. In the case of a husband's death, under Shia laws, wives can only inherit movable assets, while Sunni laws allow wives to inherit land and assets. Regardless of the sect, non-Muslim women cannot inherit from their Muslim husbands. The explanation given for the inequality is that women are supposed to be supported by their male relatives. However, with modernization and more women entering the workforce, women are contributing more and more to household expenses and are less dependent on their husbands (Karolak 2014).

Citizenship

An important issue still to be resolved is the inequality in the law of citizenship. As of now, a man married to a non-Bahraini woman may pass citizenship to his wife and children. However, a woman married to a non-Bahraini man cannot pass her citizenship to her husband or children (Bahrain Center for Human Rights 2014).

Politics Rights

Since Hamad bin Isa Al Khalifa took throne in 1999, women's rights in Bahrain have steadily improved. In 2001, the Supreme Council for Women (SCW) was established and is headed by Princess Sabeeka bint Ibrahim Al Khalifa. The SCW was the first major step toward greater female political participation and equality.

In the 2002 constitution put forth by King Hamad, Chapter 1, Section 2(1), proclaims, "All citizens, both men and women, are entitled to vote and to stand for election, in accordance with the constitution and the conditions and principles laid down by the law. No citizen can be deprived of the right to vote or to nominate oneself for elections except by law" (Ahmed Abdulla Ahmed 2010, 75–76). Therefore, in 2002, women were granted suffrage, making Bahrain the first member of the Gulf Cooperation Council (GCC) to do so (Ahmed Abdulla Ahmed 2010). Furthermore, in 2002, Bahrain ratified the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW), with reservations to several important

provisions, including those regarding family law, citizenship, and housing rights (Ahmed Abdulla Ahmed 2010). Despite the slow implementation of CEDAW's suggestions and the nullification of several articles, the joining of this convention was an important step toward improving women's rights.

Another noteworthy move toward greater equality was the establishment of the Family Law of 2009. The Family Law organizes the marriage relationship of Sunni Muslims regarding engagement, dowry, maintenance, parentage, separation, and custody. The law outlines conditions for marriage, including requiring consent from both parties, the presence of an adult male witness, a dowry for the wife that is agreed upon between parties, competence of the husband, and proportionality and appropriateness of age. Furthermore, the law recognizes three forms of separation in marriage and outlines custody of the children in cases of separation. Although this law has established some security for the minority Sunni population, it does not apply to the majority Shia population who do not have an official Family Law; such matters are determined on a case-by-case basis in the Shia courts (Al Rayes 2014).

The Judicial System

The judicial system in Bahrain is complicated and highly criticized by organizations such as the Human Rights Watch and the Bahrain Center for Human Rights. Sunni and Shia attend separate courts with differing interpretations of sharia law. In a sharia court, a woman's testimony is worth half of a man's (Ahmed Abdulla Ahmed 2009).

Participation in the Government

Women's participation in the government started in 2001 when Mrs. Lulwa Al-Awadhi was the first female appointed the rank of minister and was selected as the secretary general of the Supreme Council for Women (General Secretariat 2013). Following the 2002 constitution, municipal and parliamentary elections were called, and six women ran unsuccessfully for seats in the Council of Representatives (Ahmed Abdulla Ahmed 2010, 76). Because the king established the constitution without public approval, many people boycotted the election, leaving the total voter turnout at 53.58 percent for the first round and 43 percent for the second round. Women cast slightly more ballots than men (National Democratic Institute for International Affairs 2002).

In 2004, Bahrain became the first Gulf nation to appoint a woman, Dr. Nada Hafath, for the position of minister of health (Ahmed Abdulla Ahmed 2010). The second round of elections in 2006 proved to be even more fruitful for women, as Latifa al-Gaoud was elected the first female parliamentarian (Ahmed Abdulla Ahmed 2010). By May 2013, women held a variety of upper-level governmental positions, including ministers, undersecretaries, Council of Representatives member, Shura Council member, ambassador, chief executive officer, and municipal council member (General Secretariat 2013). Although women have made progress in obtaining governmental leadership positions, they remain a minority.

Feminist Movements

Due to the long history of trade with the outside world and the influx of foreign workers, Bahrainis have been exposed to new ideas and demanded reform. By the 1950s, the wealth from the oil boom had yet to reach the people of Bahrain. During the 1960s, the growing number of Bahraini university graduates and regional development had fueled the population's fervor for change in Bahrain. The unrest in the country contributed to the push for independence from the British in 1971. During this time, women were eager to become involved in the political process, establishing women's societies with political orientations.

By the 1970s, the younger, more educated urban female population had discarded the traditional *abaya*, drove cars, communicated with male colleagues, and was politically involved. However, once independence was achieved, women were excluded from political decision-making roles, partly due to traditional tribal orientation and radicalized and liberalized men who did not support them (Seikaly 1994). Although women were blocked from official government posts until 1999, women organized themselves into various women's associations and nongovernmental (NGO) and nonprofit organizations. Furthermore, women played, and continue to play, an important role in the popular uprising that began in 2011.

Women's Associations, NGOs, and Nonprofits

The Bahraini Young Women's Development association, the first recognized women's association, was established in 1955. Their strategy was to stir the conversation about women's rights and issues. In 1969, the AWAAL Women's Association established themselves with the mission

of developing women, their work, and their rights. Since the 2000s, numerous women's associations, NGOs, and nonprofit organizations have been created and are working toward improving women's lives (Al Garaibeh 2011). An estimate from 2008 suggests that women comprise more than 60 percent of NGO members (Ahmed Abdulla Ahmed 2010).

Participation in the Popular Uprising

Women truly emerged into the political limelight in the wake of the Arab Spring in 2011. As with neighboring countries, women took to the streets side-by-side with men and demanded reforms. On February 14, 2011, thousands of Bahraini citizens—half of whom were women—flooded the Pearl Roundabout at the center of Manama. Political activist Zainab al-Khawaja asserts that she was initially faced with opposition from men, but once they realized that she was the daughter of a famous politician, they embraced her and other women taking part in the protests (Marlowe 2012). According to human rights activist Jen Marlowe, who was in Bahrain during the uprisings, the success of integrating women into the opposition movement was not linear and faltered at times. However, she also saw women on the front lines, organizing help for the injured, and publicly speaking at the Pearl Roundabout. According to Jihan Kazerooni, a member of the Bahrain Center for Human Rights and vice president of the Bahrain Rehabilitation and Anti-Violence Organization, “women are the power and the strength of our revolution” (Marlowe 2012).

Bahraini women were also subject to the violence of the government's crackdown on protesters. Women were imprisoned, beaten by police, and raped. According to some reports, 14 women died during the crackdown (Karolak 2014). In 2011, a report released by the National Commission for Truth revealed the arrests of 250 women, who were abused and denied their rights through physical and psychological torture (Bahrain Center for Human Rights 2014). Women are still present in the ongoing protests, and the citizens of Bahrain hold on to the hope for change.

Religious and Cultural Roles

The *Ma'tam*

Bahraini women have long been involved in the religious community through the *ma'tam*, or Shia religious center.

Rock 'n' Roll Camp in Bahrain

In August 2013, the nonprofit organization Rock 'n' Roll Camp for Girls, from Portland, Oregon, was invited by the U.S. Embassy to host a music camp in Bahrain. Being the first of its kind in the Gulf area, the camp attracted around 50 girls between the ages of 12 and 17, according to Executive Director Nadia Buyse. At camp, the girls were taught how to play guitar, bass, keys, and drums, which provided a noncompetitive, supportive environment for female musicians. The camp attendees in Bahrain experienced a cross-cultural connection with girls who attended the Portland, Oregon, Rock 'n' Roll Camp through video and zine making. Subsequently, 10 all-female Bahrain bands were created, and they performed at the end of the rock camp. Girls who participate in Rock 'n' Roll Camp learn music as well as how to promote social change while finding their own voices.

—Nicole Wiseman

Historically, women's activities in the *ma'tam* consisted primarily of reciting special narratives from famous Shia imams, religious stories and poems, and Koranic passages and grieving and socializing within the community. According to an ethnographic study by Sophia Pandya, women's use of the *ma'tam* has evolved over the past few decades. While the men's *ma'tam* has always been a site of religious and political gatherings, in recent years, women have expanded their use of the *ma'tam* beyond the historic religious and social functions. Whereas grieving and crying took up most of the time spent in the *ma'tam* before, women are spending more time on other activities, such as secular education and political discussions (Pandya 2010). This paradigm shift in the use of the *ma'tam* is one of the many factors leading to greater empowerment and leadership of women in Bahrain.

In the Media

In today's modernized world, the media is pervasive and plays an important role in girls' and women's lives. Unfortunately, women employees are severely underrepresented in the major media outlets, the Ministry of Culture and Information, and the Bahrain Radio and Television

Corporation. Additionally, few media outlets produce quality programming regarding women's rights. Furthermore, the few movies and television shows produced annually in Bahrain tend to depict violence against women as normal and socially acceptable. On the rare occasion that serious issues such as violence against women and sex trafficking are addressed, viewership tends to be low, and they receive negative reviews in the local newspapers (Ahmed Abdulla Ahmed 2010).

Issues

Trafficking and Prostitution

The economic structure of Bahrain's economy fosters favorable conditions for human trafficking in the country, particularly for forced laborers and prostitution. Many economic sectors rely on immigrant workers, encouraging men and women from countries such as India, Pakistan, Nepal, Sri Lanka, Indonesia, Bangladesh, Thailand, Ethiopia, Eritrea, and Russia to immigrate to Bahrain, where there is little protection from work regulations. Once in Bahrain, migrants are subjected to practices such as unlawful withholding of passports, restrictions on movement, contract substitution, nonpayment of wages, threats, and physical or sexual abuse. According to the CIA, Bahrain does not fully comply with the minimum standards toward the elimination of trafficking. The government has made discernible efforts to investigate, prosecute, and convict trafficking offenses, including an antitrafficking law passed in 2008 (U.S. Department of State 2010).

In 2009, Bahrain was listed as one of the top 10 "Sin Cities" by a men's magazine because of the proliferation of the business of prostitution in recent years (Browne 2010). According to a 2007 study by the Bahrain Youth Society for Human Rights, there are more than 13,500 prostitutes in Bahrain, and the numbers are growing (Bahrain Youth Society for Human Rights 2007).

Domestic Violence

A study carried out by the Information Center for Women and Children indicates that 30 percent of women in Bahrain face some sort of domestic abuse. Currently, there are no laws specifically addressing domestic abuse. Unfortunately, much of this abuse is not reported, and domestic violence is not an official reason for divorce. However, the number of women seeking help has increased dramatically due to growing awareness and the establishment of

domestic violence centers. NGOs such as the Awal Women's Society and the Bahraini Young Ladies' Association have offered their aid to women through free legal advice, hotlines, and private shelters (Ahmed Abdulla Ahmed 2010).

Sexual Assault and Rape

Although rape is considered illegal, the Penal Code does not adequately address perpetrators. In fact, Article 353 asserts that no one can be sentenced for sexual assault if they enter a marriage contract with the victim. Therefore, the penalty is completely moot, and the perpetrator can easily escape legal consequences by marrying the victim (Bahrain Center for Human Rights 2014).

Inequality

Although the Kingdom of Bahrain has made several strides to close the gap between men and women, women still face inequality in many facets of life. According to the *2013 Global Gender Gap Report*, Bahrain is ranked 112 out of 136 in regard to overall gender equality (1st being the most gender equal and 136th being the least). This reputable report draws from a variety of sources and measures aspects of gender inequality in 136 countries against a scale of 0.0 representing inequality and 1.0 representing equality. Bahrain ranks 117th in economic participation with a score of 0.515. As noted above, women are more likely to be unemployed and have less access to work due to societal discrimination and labor laws. Regarding educational attainment, Bahrain is in the 71st position (World Economic Forum 2013). Women have made substantial advances since the mid-20th century and now represent 61 percent of university students (General Secretariat 2013). Under the category of health Bahrain ranks 112th and for survival, it ranks 113th in political empowerment (World Economic Forum 2013).

Botswana

Overview of Country

Botswana, also known as Republic of Botswana, is a landlocked country in southern Africa. It borders Namibia, South Africa, Zambia, Zimbabwe, and Angola. The country is mostly plateau, with an elevation of 3,300 feet, and covers approximately 224,607.2 square miles (581,730 sq. km), 96 percent of which is land. As of June 2015, Botswana's population was approximately 2,340,173, with the majority group (37.31%) within the 25–54 age group. The capital of Botswana is Gaborone, which as of 2016 had a population of 232,000 people (CIA 2016).

Botswana gained its independence from the British on September 30, 1966, and since then it has been led by a president and vice president, both members of the Botswana Democratic Party. The president is elected through a democratic process for a five-year term and is eligible for a second term. The country has multiple legal systems of civil law, common law, and customary law (CIA 2016). Civil law was adopted from Roman Dutch law, common law was adopted from English law, and customary law refers to the indigenous or unwritten law (CIA 2016).

Ethnic groups in Botswana include Tswana (or Setswana), Kalanga, Basarwa, Kgalagardi, and white. English

is the official language in Botswana, but it is only spoken by 2.8 percent of the population (CIA 2016). The most commonly spoken language is Setswana (77%), followed by Sekalanga (7.4%), and Shekgalagadi (3.4%). Other languages spoken in Botswana are Zezuru/Shona, Sesarwa, Sembukushu, and Ndebele (CIA 2016). In 2002, the United Nations condemned how Botswana treated people of the San, or Basarwa, ethnic group who occupy the Central Kalahari Game Reserve by denying them the right to occupy land. This group is considered an indigenous population tied to the land and has been facing threats of displacement. In the report, the United Nations concluded that domestic laws, including the Chieftainship Act, unfairly alienate the Sans for not speaking Tswana, excluding the group from cultural, economic, and political activities important for the group's survival.

Economically, Botswana is a middle-income country (World Bank 2016). The country's gross domestic product (GDP) has grown from just USD\$70 in 1966 to more than USD\$14 billion as of 2015. Economic growth has been attributed to fair elections and political stability as well as the microeconomic management. Diamond mining, tourism, and agriculture are major sources of economic growth for the country. However, despite its economic success, Botswana is also plagued with issues of poverty, gender inequality, and HIV/AIDS.

In 2014, the UN Development Programme (UNDP) ranked Botswana 106th out of 187 nations based on the Gender Inequality Index (GII, 0.480), represented by a low percentage of women holding parliamentary seats (9.5%) and a 10-point gap in the labor participation rates between men and women aged 15 and above. This inequality is seen in HIV, as well, where women account for more than 53 percent of the total population living with HIV (UNAIDS 2015).

Girls and Teens

In 2015, girls and teens represented 11 percent of the population in Botswana (CIA 2016). This population group had a literacy rate of 99.58 percent as of 2015 (UNESCO 2015).

Education

The education system in Botswana follows the 7-3-2 system (7 years primary, 3 years junior primary, 2 years senior secondary); the first 10 years are mandatory, according

to the Ministry of Education and Skills Development (Republic of Botswana 2016). The average school age for primary school enrollment is six years for both boys and girls. The same report shows that Botswana has one of the highest teacher-to-pupil ratios, with 25 in primary school, 15 in junior secondary, and 14 in senior secondary. The academic calendar is approximately one year, January to December, with 1 week off following terms 1 and 2 and 7 weeks off following term 3 (UNESCO 2015).

Primary Education

Primary education consists of seven years divided into lower primary and upper primary. After completing the standard seven, students are expected to sit for the Primary School Leaving Examination (PSLE). The main goal of lower primary education is to equip citizens of Botswana with traditional knowledge, including traditional languages, cultures, and societal values. Religious education, moral studies, agriculture, science, mathematics, Setswana, English, and home studies are examples of classes that students in lower primary school take. The goal of upper primary school is to prepare students for secondary education. At this stage, students are allowed to choose eight subjects from a list of subjects that range from mathematics to home economics. After completing the PSLE, students transition to secondary education.

Secondary Education

Secondary education in Botswana is a continuation of primary education, 3 mandatory years to complete the 10-year education system offered free of charge by the government of Botswana. During the 3 years, students are said to be in junior secondary program in which its goal is to teach teamwork, decision making, technology, equipment, vocational subjects, and manipulative skills. At the end of junior secondary school, students take the Junior Certificate Exam (JCE)—a comprehensive exam that then determines placement into senior secondary education.

Senior secondary education is a two-year, post-basic education focused on broad subjects that teach work ethic, technology, and practical work. This stage prepares students for tertiary education and readies them to join the workforce. According to the education model in Botswana, it is at this level and beyond that students are prepared to be competitive employees. At the end of senior secondary education, students are expected to take the Botswana General Certificate of Secondary Education (BGSE) that

determines placement into universities. As this level is not free, gender and class disparities exist.

Tertiary Education

Tertiary education in Botswana takes place in universities. According to the African Universities database, those who choose to pursue higher education can attend one of five universities: Botswana International University of Science & Technology, the University of Botswana, the Botswana College of Agriculture, the Institute of Development Management, or the Botswana Accountancy College. Certificate programs take one year, diploma programs take two years, and bachelor's degree programs take approximately five years. Postgraduate studies are also available in Botswana.

In 2009, Botswana's government spent 20.5 percent of its expenditure on education, which represented 9.5 percent of the GDP (World Bank 2016). This ensured high enrollment percentages for both men and women into primary school (UNESCO 2016). The UNDP also reported high percentages of the population with some secondary education (73.6 for women and 77.9 for men) between 2005 and 2014 (UNDP 2014). Despite narrow gender gaps in education enrollment and better performance by girls compared to boys (UNESCO 2015), issues related to school dropout due to pregnancy continue to plague young girls and need to be addressed.

Employment

Despite high economic growth in Botswana, the unemployment rate in the country was 20 percent in 2013, three points higher than the rate in 2009. Unemployment among youth aged 15 to 24 years of age was 43.5 percent for women, compared to 29.6 percent for men as of 2010 (CIA 2016). The gender inequality also exists in labor force participation. The United Nations Statistical Database (UNDATA) reported that among those aged 15 and above, participation was only 71.9 for women, compared to 81.6 for men (2016). When it comes to earnings, the latest statistics show that women in Botswana had a lower gross income per capita (measured in PPP international dollars) of 15,178.7, compared to 18,096.4 for men (UNDP 2015). Reasons for gender disparities include custom laws that reinforce gender division of labor as well as gender inequality in education. Botswana legislation allows women employed in the public sector to take 12 weeks of maternity leave.

Health

In 2014, Botswana spent 5.4 percent of its GDP on health, with most of the expenditure going toward the fight against HIV/AIDS (WHO 2016). According to UNAIDS, Botswana's HIV prevalence rate in 2014 was 25.16 percent, making it the second-highest country, superseded only by Swaziland. Among those between 15 and 24 years of age, HIV prevalence is 3.5 percent in men and 6 percent in women. High HIV prevalence rates coupled with communicable diseases such as malaria have been to blame for lower life expectancy of approximately 56 years in men and 52 years in women as of 2015 (CIA 2016). However, this number has significantly increased from 2000 when the average life expectancy was only 39 years.

Access to Health

According to Botswana's Ministry of Health (MOH), the government of Botswana provides universal health care to all citizens through a decentralized system. The country has hospitals, clinics, health posts, and mobile health centers strategically located to provide health to each district and rural area. Delivery of health services is accomplished hierarchically, corresponding to the number of facilities, starting with mobile posts (800 facilities), followed by health posts (338 facilities), and then clinics (277 facilities), primary hospitals (17 facilities), district hospitals (14 facilities), and finally referral hospitals (3 facilities). The country also has 3 private hospitals and 167 private medical clinics operated by faith organizations and mining organizations. In 2009, the country's physician density was 0.4 physicians to 1,000 people, and hospital bed density was 1.8 beds to 1,000 population members (CIA 2016).

Sexual reproductive health services and antiretroviral health in Botswana are provided completely free of charge according to the Ministry of Health, and general check-ups for those aged 5 to 65 years old are 5 pula (1 dollar is approximately 10 pula). Current efforts in Botswana include specific campaigns for malaria, HIV/AIDS, and tuberculosis (WHO 2016).

Maternal Health

Maternal health in Botswana is overseen by the MOH, which in 1973 established the national Maternal and Child Health/Family Planning (MCH/FP) program. This program's goal was to improve prenatal, antenatal, delivery,

and postnatal care. Persistent high numbers of maternal deaths and infant mortality led the MOH to develop a safe motherhood program focused on improving birth outcomes for both the mother and child through improving coverage as well as quality of maternal services.

The mean age of a mother in Botswana is 19 years old. The maternal mortality rate on the other hand, as of 2015, is 129 deaths per 100,000 live births. In 2009, Botswana ranked 145th in infant mortality, with a total rate of 8.93 deaths per 1,000 live births. Botswana's fertility rate was 2.33 children born to each woman. On the other hand, the contraceptive prevalence rate for women aged 12 to 49 was 52.8 percent between 2007 and 2008 (CIA 2016).

As of 2014, the workforce available for maternal health needs in Botswana included 1,501 nurses, midwives, and auxiliary midwives; 591 physicians and generalists; and 3 obstetricians and gynecologists, according to United Nations Population Fund (UNFPA 2016). Nurses typically provide prenatal services, family counseling, and contraceptives. Those with midwifery skills also provide complex care while obstetricians attend to emergency cases. Botswana suffers from a shortage of health care providers, and, in response to the challenge, the country utilizes family welfare educators. Family welfare educators are primary school graduates who encourage community members on the benefits of using health facilities for delivery. Because of the efforts, more than 95 percent of childbirths in Botswana take place in health facilities where appropriate immunizations are administered (Rizzuto and Rashid 2002). Additionally, the country's rate of antenatal and prenatal care is among the highest in the region, with antenatal rates reaching 99 percent in 2009 (WHO 2016). Breastfeeding is highly encouraged in Botswana.

Diseases and Disorders

Botswana continues to be one of the countries most adversely affected by HIV/AIDs. Issues of gender and power manifest themselves in the disproportionate prevalence of HIV among women and girls compared to men and boys. It also has high rates of other communicable diseases (WHO 2016). AIDS, tuberculosis, and malaria account for 45 percent of morbidity in Botswana. Implementation of specific programs by the Ministry of Health has led to a dramatic decline of malaria cases from 8,065 to 1,065 between 2001 and 2015 (WHO 2016). Communicable diseases, such as tuberculosis; acute respiratory diseases; sexually transmitted infections; and tropical diseases, such as

bacterial diarrhea, hepatitis A, and typhoid fever, continue to threaten the health of Setswana people.

In 2014, while communicable diseases accounted for 54 percent of all deaths in Botswana, noncommunicable diseases accounted for 38 percent. These were chronic respiratory diseases (2%), injuries (9%), cardiovascular diseases (18%), diabetes (4%), and cancer (5%). Higher numbers of these diseases were reported in the urban areas, where 67 percent of the population resides. Other risk factors for noncommunicable diseases included smoking, alcohol use, obesity, and high blood pressure. In 2011, 22 percent of the population smoked (36% men, 7% women), and 32.9 percent (33% men and 32.6% women) had elevated blood pressures as of 2008. The same report also showed that, in 2010, the total per capita pure alcohol consumption was 8.4 percent (14.3% in men and 2.5% in women) (WHO 2016).

There are inconsistent statistics on mental illness in Botswana. Access to mental health is the responsibility of the MOH, which established and enacted the Mental Health Act of Botswana in 1971. The legislation ensures funding for mental health facilities and adequate training for mental health professions. Even with this funding, as of 2011, there were only 0.25 psychiatrists, 1.52 psychologists, and 4.05 nurses for every 100,000 people (WHO 2016).

Family Life

The Marriage Act in Botswana stipulates that 18 is the age of marriage with parental consent and 21 without consent. Minors who have undergone initiation rituals are also deemed marriageable under customary laws that are widely practiced, even though discriminatory common law supersedes customary law in Botswana. As a result, there have been reports of young girls aged 15 to 19 being married, widowed, or divorced (SIGI 2016).

Upon marriage, both men and women are considered equal guardians to their children since the abolition of the Marital Power Act in 2004. Under customary marriages and religious marriages, however, women are still considered legal minors upon marriage, giving husbands sole guardianship of the children. As such, most people choose to register their marriages under the Marriage Act. The average age of first marriage was 38 for men and 33 for women. *Bogady* (paying dowry) and polygamy are also persistent in Botswana, although polygamy is not as common.

When it comes to divorce, women need to have resided in Botswana for three consecutive years to seek divorce.

This stipulation does not apply to men. In the event of a divorce, men and women within marriages under common law are entitled equal rights. In the event of a husband's death, the wife has had equal rights to property management since 2004, when Marital Power Act was abolished. Under customary law, however, the eldest son is considered the principal heir of the property (SIGI 2016).

Botswana's legal system does not recognize same-sex couples and deems same-sex marriage illegal. The penal code recommends a penalty of up to seven years' imprisonment for same-sex marriage. The Lesbians, Gays, and Bisexuals of Botswana (LeGaBiBo) is the primary advocacy group for LGBT rights in Botswana.

The Social Institution & Gender Index (SIGI) by the Organization for Economic Co-operation and Development (OECD; SIGI 2016) explained how the multi-legal system in Botswana could be one of the reasons contributing to gender disparities in HIV. OECD reported that although Botswana joined the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) in 1996, the antidiscriminatory laws put in place are often practiced alongside customary laws. For example, the Constitution of Botswana considers the age of marriage at 18; however, this does not apply to customary marriages, where minors who have undergone initiation rituals are deemed marriageable. Such conflict between common law and customary law reinforce male domination and fail to protect women's rights as equal citizens.

Politics

Women's involvement in politics can be traced back to 1966, after Botswana gained independence and the Botswana Council of Women was formed. The organization was led by Ruth Khama, the current president's wife, and composed of other politicians' and elders' wives. The goal of the council was to teach African women how to be good wives. In 1977, the opposition party, the Botswana National Front (BNF), established a women's wing. Ten years later, the ruling party, the Botswana Democratic Party (BNP), also established a women's wing. Women's wing members were wives of politicians within specific constituencies and responsible for fund-raising for specific parties.

In 1993, women in nongovernmental organizations (NGO) joined together to protest a citizenship rule passed by parliament. The law limited citizenship for foreign husbands married to Botswana women, but it did not extend the limitation to foreign women married to Botswana men.

The law also gave fathers sole responsibility to decide children's citizenship, regardless of where the child was born. Botswana finally amended the law in 1995, when it joined the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW), giving both men and women the right to pass citizenship to their children. Women's participation in politics in Botswana has been less about increasing involvement and more about changing specific government policies that may be oppressive. According to the World Economic Forum's gender report in 2011, 8 percent of parliamentarians and 12 percent of ministerial positions were filled by women.

Religious Roles

The majority of the population in Botswana practices Christianity (79%) (CIA 2011). The rest are Badimo Baha'i, Hindu, Muslim, Rastafarian, or have no religion. Prior to the introduction of Christianity through missionary work, Botswana practiced traditional religion, of which Badimo is one. Traditional religion in Botswana involves spiritual healing and invoking the spirit. Formal spiritual healing and other leadership roles have mainly been the responsibility of men. The only leadership role for women in religious spaces was as deacons until 1990, when the church decided that women could be ordained as preachers but not full ministers.

Issues

Other issues of special concern for women in Botswana include domestic violence, rape, and racial discrimination. Domestic violence is defined as any physical, emotional, sexual, or domestic act that is harmful or abusive to the health or safety of the applicant. Statistics on domestic violence in Botswana are lacking. The OECD reports that although there are efforts to deal with issues of domestic violence with legislation, such as the Domestic Violence Act that established governmental shelter, law enforcement and other legal personnel fail to take the issues of violence seriously. According to the World Bank, economic dependence and lack of legal knowledge are reasons why women continue to experience domestic abuse in Botswana. The definition of domestic violence does not mention marital rape as a type of violence.

The penal code includes up to 10 years of imprisonment with no guarantee for bail as punishment for rape (but not marital rape). There is no nationwide legislation

against sexual harassment other than what is stipulated under the Public Service Act, which deems sexual harassment in public service a criminal offense (SIGI 2016). There is limited legislation to tackle female genital cutting or mutilation, which is actually an uncommon practice in Botswana.

Forced labor and human trafficking are also issues affecting women and girls in Botswana. In 2015, Botswana had a net migration rate of 4.56 migrants per 1,000 people (CIA 2016). Within Botswana, individuals who are unemployed and those residing in rural areas are often the victims of human trafficking. Girls and women are sent into domestic prostitution to earn money for the family, thus contributing to the epidemic of human and sex trafficking. Botswana has been criticized by the international community for its lack of commitment to antitrafficking laws and for not complying fully with set standards.

Burkina Faso

Overview of Country

Burkina Faso is a landlocked country located in Western Africa that is bordered by Mali, Niger, Benin, Togo, Ghana, and Côte d'Ivoire. Burkina Faso is 105,000 square miles (274,200 sq. km) in area and is mostly savanna, with some hills in the western and southeastern regions of the country. The climate of Burkina Faso is tropical. The country is considered one of the six Sahel countries. Sahel is the name of the region where the Sahara Desert transitions into savanna. This region of Africa is prone to droughts due to the Sahara Desert gradually expanding farther south.

In 1896, kingdoms in present-day Burkina Faso came under French rule. In 1932, the country was divided up and became parts of Niger, Mali, and Côte d'Ivoire. In 1947, the country was reassembled. The country gained

independence from France in 1960. Until 1984, Burkina Faso was known as Upper Volta. The name *Burkina Faso* means “land of the honest people” in a combination of local languages.

In 2015, Burkina Faso’s population was 18,931,686, with 65 percent of the population 24 years old or younger. Sixty-two percent of the population was Muslim. Catholicism, Protestantism, and traditional religions are also practiced. Eighty percent of the population lives in rural areas (Kobiane et al. 200, 469). Burkina Faso is composed of 60 ethnic groups (U.S. Department of State 2012), including Mossi, Rulani, Gurma, Bobo, Gurunsi, Senfo, Bissa, Lobi, Dagara, Tuareg/Bella, and Dioula. The official language is French, but the vast majority of the population speaks a native African language.

The Burkinabe economy heavily relies on agriculture and livestock. Farming can be difficult because of the arid effect of the Sahara Desert on the climate. Burkina Faso experiences droughts that interfere with agriculture production. Cotton and shea tree nuts (which are used to create shea butter) are the top crops grown. Other crops include sorghum and okra (Mbugua 2015).

Many of the issues women in Burkina Faso face are related to health and marriage. Pregnancy and having children is very important to women in Burkinabe culture and can be dangerous for both the mother and child due to poor education about good health practices and the lack of quality medical facilities. Many women get married in their teens and have children young, especially in rural areas. Female circumcision is an issue that many women still face despite education initiatives and legal mandates. The 2015 United Nations Development Programme’s (UNDP) Gender Inequality Index (GII) ranked Burkina Faso 144th out of 188 countries, with an index of 0.631 (UNDP 2016).

Girls and Teens

Burkinabe girls have a short childhood, as family obligations often require them to work or care for family members or they get married. Girls in Burkina Faso marry as young as age 15. Before marriage, girls often need to care for their younger siblings, work on the family farm, or work to earn income for the family. In Burkinabe society, it is the role of women to take on domestic roles, caring for children and maintaining the household and farm.

For most girls in Burkina Faso, marriage and children are the main goals of life. They are important to girls because that is how they transition into adulthood. Marriage is also important for social status and can be a way for a woman

to improve her life. For example, a rural woman who marries a migrant worker could then have access to goods from the city. Having children also gives women security because they will have someone to take care of them in their old age. Fifty percent of girls are married by 18, and half are already mothers (Amnesty International 2015).

Sex education is provided in school; however, it is often offered too late. Information provided includes how pregnancy occurs, contraceptives, and child and family care. Sex education typically begins later in the secondary education years, after many girls have already become sexually active. Before taking sex education classes, girls and teens have little knowledge about sex, the chances of pregnancy, or the dangers of sexually transmitted diseases. Sex education also often fails to dispel fears that using contraception will cause infertility later in life.

Teen Pregnancy

Because having children is so important, and fertility, sexuality, and pregnancy show that a girl is normal in Burkinabe society, teenaged girls feel pressure to prove their fertility, which leads to premarital pregnancy. Teenagers who become pregnant while still in school are permitted to continue to attend school while pregnant and after giving birth; however, there is a high dropout rate of teenaged mothers because of the demands of caring for a child. At school, younger pregnant teens are likely to be treated disrespectfully by students, especially male students. Pregnant teenagers are no longer treated or thought of as children by their peers or adults, as pregnancy signifies the transition to adulthood from being a youth.

Literacy

Burkina Faso has the lowest literacy rate in Africa at 21.8 percent (American Association of Collegiate Registrars and Admissions Officers 2016). Thirty-three percent of women over the age of 15 are literate (UNICEF 2013). This low literacy rate is due to the poor educational enrollment of students. Additionally, French is the official language of the government, but a large portion of the population does not know French because of the lack of school attendance. The majority of the population speaks a tribal language.

Education

The government mandates that all children must go to school through the age of 16. In practice, there are low attendance rates, especially for girls, as family obligations

often require them to help at home or to work. Burkina Faso has one of the lowest education attendance rates in Africa (Kobiane et al. 2005). About 40 percent of primary school-aged children go to school, and about 9 percent of secondary school-aged children go to school (American Association of Collegiate Registrars and Admissions Officers 2016). Out of the students who go to school, 35 percent are female. While it is required for children to attend school, on average, girls only attend school for about seven years (CIA 2013). The rapid growth of the population paired with the lack of infrastructure to meet the needs of the population has contributed to the educational problems Burkina Faso faces.

Factors influencing the lack of school attendance include children having to work to help financially support their families and having to help in the household. The HIV/AIDS pandemic also influences attendance, as many children are too ill to go to school or children become orphaned after losing their parents. Children who are orphans are less likely to attend school.

Access to education is also an issue for children. Some villages do not have a school, which then requires students to walk to a neighboring village. Sometimes parents do not feel comfortable with their children walking such a long distance alone, so they do not send their children to school. Access to education is also inhibited by high rates of absenteeism of teachers due to HIV/AIDS.

Educational Reforms

Burkina Faso has made several attempts at educational reform. During the 1990s, enacted educational reforms were able to improve the quality of schools, increase the number of schools, and increase enrollment. By 1999, 47 percent of schools had drinking water, and 45 percent had sanitation facilities. The number of literacy centers doubled, which led to an increase of literacy programs that reached up to 4,500 villages. A free textbook program was also started to help reduce the cost to families for sending children to school. Community schools and child care centers were built in rural areas to encourage more girls to go to school (Ki and Ouedraogo 2006, 206–207). In 2000, a new plan targeting improvements in education and increased enrollment was launched. This plan attempts to improve education by providing more textbooks for students and hiring teachers with higher qualifications.

Girls in rural areas have the lowest primary education rates in Burkina Faso, and in 2005, an education program

was launched that targeted girls' education. The program was able to increase the number of girls attending school as well as increase scores in math and French. Initiatives have also incorporated mentoring for girls to help improve literacy rates. Providing meals and textbooks in schools has also led to an increase in enrollment. Despite attempts and successes in raising enrollment and improving education, Burkina Faso has one of the lowest primary school rates in Africa and in the world (Levy et al. 2009).

Primary Education

Primary education lasts six years, which is typically for children ages 6 to 12. Primary education is free, but there are often fees that parents must pay. Many children do not finish primary school by age 12 due to starting late or having to repeat years. At the end of the primary school years, students take a national exam to determine secondary school placement.

Secondary Education

After primary education, students are able to choose to attend a secondary education school that focuses on more general education or one that is more technical or occupation focused. Secondary education is for students aged 13 to 16. Legally, students must attend school until they are 16; however, that law is not enforced, so there are low attendance rates. Sex education is taught during the secondary education years.

Postsecondary Education

There are both private and public postsecondary institutions. There are three public universities—the University of Ouagadougou, the Polytechnic University of Bobo-Dioulasso, and the University of Koudougou—and four private universities or institutes: Free University of Burkina, Private Polytechnic Higher Institute, Higher Institute of Technology, and Higher School of Applied Sciences. Degrees offered by the universities are two to three years in length. In addition to public universities, there are also some two-year public technical schools that focus on vocational training. There are also graduate-level degrees, ranging from one-year master's programs, to three- to five-year doctorate degrees, to six-year medical degrees.

Enrollment of women at the postsecondary level is low. At the University of Ouagadougou, which is the largest university in Burkina Faso, about 25 percent of the student

population is female. When broken down by subject, 5 percent of those women study sciences. There are only two female physics professors in the country. Part of the low representation of women in the sciences is due to gender norms in Burkina Faso, which imply that science and technology are fields for men (Kafando et al. 2009, 91–92).

Health

Health is major concern for women in Burkina Faso. Poverty, undernourishment, lack of education about illness prevention, and lack of access to health care facilities are everyday issues for women. The average life expectancy for women is 57 (CIA 2013).

The percentage of governmental expenditure that goes toward health care has been gradually declining, with 13.5 percent of the governmental expenditure spent on health care in 2013 (WHO 2016). A large portion of the governmental expenditures for health care go toward immunizations for infants and HIV/AIDS prevention and treatment programs.

The lack of proper sanitation in Burkina Faso contributes to health concerns in the country. One in ten Burkinabe have toilets. Poor sanitation contaminates food and water sources, and about 25 percent of the population does not have access to clean drinking water. Contaminated food and water lead to cholera outbreaks, and many children die from diarrhea (SOS Children 2016).

Access to Health Care

Burkina Faso's Ministry of Health oversees the country's health care system. The Ministry of Health struggles to cover the costs of providing health care to the populations, so organizations such as the World Health Organization (WHO) partner with the Ministry of Health to provide support. Burkina Faso provides universal health care for its citizens, though the government is still working on strategies to be able to finance universal health care. The World Health Organization has helped raise money and provide guidance on financial strategies for providing health care.

Access to health care facilities can vary within the country. Those living in urban areas have better access to health care; however, the majority of the population lives in rural areas that often lack proper health care facilities. In rural areas, health care is provided at clinics that are staffed by personnel that may have limited knowledge of advanced medical care.

There is a deficiency of medical professionals in Burkina Faso. There are only 0.05 physicians/1,000 people (CIA 2013). Hospitals with modern equipment are located in cities and large towns, and clinics with modern equipment are located in some villages. However, many of the medical facilities are of poor quality and lack properly trained staff, especially those in rural areas.

Maternal Health

It is common for women to start having children at a young age, and most women have children between the ages of 15 and 29. Women who live in poor rural areas often do not have access to proper medical care during pregnancy or the birthing process. Women receive 98 days of paid maternity leave, which is provided by their employer and the government. During maternity leave, women received 100 percent of their wages. More than 90 percent of pregnant women go to at least one antenatal visit, and 66 percent of births are attended by skilled health care professionals. Abortions performed to save the mother are legal. Seventeen percent of married women use contraceptives (World Economic Forum 2016).

Burkina Faso has high maternal and infant mortality rates. The maternal mortality rate is 371 deaths/100,000 live births, which is the 39th highest in the world. The infant mortality rate is the 9th highest rate in the world at 75.32 deaths/1,000 live births (CIA 2013). The majority of cases of maternal death would have been preventable with proper medical care and education. Many women do not know the warning signs of pregnancy complications, so they do not seek out medical help, or if they do realize something is wrong, they do not know what to do about it.

In addition to women's lack of education, many health care workers do not know enough to properly care for or educate women. Pregnant women who are poorly educated and are given medical or pregnancy advice by health care workers may be less likely to understand the advice. Mothers who have had children before are more likely to recognize the warning signs of complications with their pregnancies due to their experience with previous pregnancies.

Breastfeeding is considered the norm, and women are expected to breastfeed. Mothers are sometimes ostracized or face violence if they do not breastfeed. Women who are infected with HIV and are more educated are more likely to use formula instead of breastfeeding their babies, even when breastfeeding is recommended. Because of the

poverty in Burkina Faso, many mothers breastfeed because they cannot afford to buy formula (Nacro et al. 2010).

Obstetric Fistula

There is a high rate of obstetric fistula among women in Burkina Faso. In 2000, 6 out of every 10,000 gynecological cases involved obstetric fistula. Obstetric fistula is a condition in which the tissue that separates the bladder or rectum from the vagina is damaged, causing the fluid from the bladder or rectum to leak into the vagina, which leads to incontinence. Obstetric fistula can be caused by difficulties during labor, improperly conducted abortions, or genital cutting. Women with obstetric fistula face severe social stigma that can lead to their being ostracized and depressed, and some women may become suicidal. Knowledge about obstetric fistula is low among women in both rural and urban Burkina Faso. Obstetric fistula occurs more frequently in women who live in rural areas due to the lack of proper medical care during labor (Banke-Thomas et al. 2013).

Malaria

Malaria during pregnancy is another major health problem in Burkina Faso. In 2011, there were 22,130 cases of severe malaria in pregnant women. Women who become infected with malaria during pregnancy risk premature births, low birth weights, miscarriage, and maternal death. The risk of contracting malaria while pregnant is higher for women who live in rural areas. A lack of education about the malaria and the risks of contracting malaria while pregnant contribute to the problem of pregnant women with the disease. The Burkinabe government has attempted to combat this health issue by creating preventative treatment plans for pregnant mothers (Cisse et al. 2014, 1–7).

Diseases and Disorders

HIV/AIDS

HIV/AIDS is a major problem in Burkina Faso. Almost 1 percent of the population (about 107,700 people) has HIV/AIDS, which is the 48th highest rate in the world (CIA 2013). An estimated 33,000 children have HIV (Nacro et al. 2010). The social stigma of having HIV/AIDS leads many women to hide the fact that they are infected. Furthermore, the lack of education among women means that they might not know that they are infected.

Female Circumcision

Female circumcision, also known as female genital cutting or mutilation, is practiced in parts of Burkina Faso despite it being illegal, and 0.8 percent of women aged 15 to 49 are circumcised (World Economic Forum 2016). The Burkinabe government has an agency called the National Committee to Fight against the Practice of Excision to combat female circumcision. In Burkina Faso, it is possible for people to be prosecuted for practicing female circumcision, which makes it unique compared to other countries where female circumcision is practiced.

Many married women have been circumcised, suggesting that some people considered it a requirement for marriage. It can also be viewed as a rite of passage. Female circumcision is practiced on children as young as two years old. While the prevalence of female circumcision has dropped over the years, there is still support for it. Despite this support, a study of mothers who had been circumcised found that only 25 percent of them had also had their daughters circumcised (Sipsma et al. 2012, 120).

Employment

Burkina Faso's economy heavily relies on agriculture, with about 90 percent of the workforce working in agriculture (CIA 2013). The main product farmed is cotton. Due to Burkina Faso's weather and droughts, farming can be difficult.

Burkina Faso has an unemployment rate of 77 percent (CIA 2013). The poor economic situation in the country leads many families to send their children to work to earn income rather than sending them to school. Over 1.5 million children aged 5 to 14 work (CIA 2013). There are some international organizations working in Burkina Faso with the goal of ending child labor there.

Child Labor

Child labor is prominent in Burkina Faso, with thousands of children working to help bring income to their families or to support themselves. In 2010, it was found that 20,000 children work in gold mines (Hubbard 2014). Many of these children have low education levels and are illiterate due to working instead of going to school. Because of the high poverty, many families and children believe it more beneficial for children to work and gain income than to go to school. Child laborers can be as young as 10 years old. Organizations such as UNICEF have initiatives to teach

child gold mine laborers vocational skills so that they can stop working in mines.

Migrant Workers

Migrant work is a main source of income for many people, especially those living in rural areas. Migrant workers travel to cities within Burkina Faso and nearby countries, such as Côte d'Ivoire, to work as laborers. Female migrant workers will travel with their husbands or on their own to stay with extended family members. Young people see migrant workers as being successful, which spurs them to also become migrant workers. Girls are typically not allowed to migrate by themselves, so they will often marry a migrant worker. Being a migrant worker or being married to a migrant worker brings social status due to the income, which allows the women to buy such status symbols as new clothes, bikes, cell phones, and gifts for family members (Thorsen 2010).

Family support of daughters who migrate varies. Some families are opposed to it, while others support it. When a family opposes the migration, the girl will sometimes leave without the family's permission. Girls who leave to stay with extended family without parental permission are often returned to their families. Girls who migrate often do so when they are between the ages of 13 and 17 due in part to the early age by which girls get married. Often girls are migrating to stay with extended family members, working for the family with or without pay. They often do not have a good idea of what life will be like when they migrate, but they feel confident that they can handle whatever happens (Thorsen 2010). While migrant workers may make more money than those who live in rural villages, many people who aspire to be a migrant worker do not realize that there is a higher cost of living associated with the city and in other countries.

Women who marry migrant workers may migrate with their husbands. In those cases, women will also work to help cover the costs of living in the city because often the husband is not able to make enough money to cover expenses. This creates tension as men struggle with the knowledge that their wives are earning money while they are not. When there are multiple wives in a marriage, the wives may take turns migrating to where their husband is located. Girls will also marry migrant workers so that they can have a small nuclear family free from the many in-laws who would otherwise live with the couple.

When migrant girls and women return to their villages, the villages and families often benefit from it because the

girls and women come back with new skills, including cooking skills, language skills, and finance skills for working in trade.

Family Life

A Burkinabe household can be composed of mostly women because of the man having multiple wives, the husband being gone as a migrant worker, or older widows helping care for the children. Men are considered the head of the household and are the main source of income.

Young girls aged 6 to 11 are often in charge of caring for the small children in the family. Girls who are 12 or older do domestic chores or work on the family's farm. The mean age of marriage for women is 20 (World Economic Forum 2016), though women get married as young as 15. Marriages can be arranged or by free choice. Polygamy does occur. A new wife has defined social norms to follow. A new wife gives deference to her in-laws. She is under the supervision of her mother-in-law and is expected to work for her mother-in-law. In return, her mother-in-law helps provide the wife with food and helps cover health care costs. As the wife ages, she takes on more tasks and responsibilities, does more work, and receives less aid from elder relatives.

There are no laws specifically about LGBT people, so homosexuality is not criminalized; however, it is viewed as anti-African, and religious prohibitions make it difficult for LGBT individuals to be out and protected in society. Discrimination laws do not explicitly protect people based on sexual orientation or identity, so discrimination is common. A law about sexual acts being against morality is on the books and has been used to support anti-LGBT actions.

Politics

Burkina Faso is a constitutional republic. The voting age is 18, and women were granted the right to vote in 1958. Burkina Faso has faced political turmoil over the years, including experiencing several military coups since becoming independent from France. In 1960, Burkina Faso became independent from France, and Maurice Yameogo became president. In 1966, Yameogo was overthrown during a military coup led by Sangoule Lamizana. Lamizana asserted his power to stay in the presidency until he was ousted in 1978 in a coup led by Saye Zerbo. In 1982, Zerbo was ousted in a coup led by Jean-Baptiste Ouedraogo. Captain Thomas Sankara took control of the country in 1983 and

tried to enact major reforms, but he was killed in 1987 in a coup led by Blaise Compaore, who was president for 27 years. Compaore resigned from the presidency during an uprising in 2014 when he tried to pass a law that would extend his presidential term. An acting president took over until the next presidential election, which took place at the end 2015. In December 2015, former prime minister Roch Marc Christian Kaboré became president.

There are many political parties in Burkina Faso. The 1991 constitution declared equality for all citizens and respect for their dignity. In 2009, a law was passed saying that at least 30 percent of a political party's candidates for election must be women (BBC 2016). In 2012, 13 of the 127 assembly members and 5 of the 32 presidential cabinet members were women (U.S. Department of State 2012). There is a dedicated minister of women. Most women who serve in the government fill roles that are an extension of existing social roles for women. Despite these advances, there is little legislation that provides actual protection for women or punishment for those who harm them. For instance, the law states that women have the right to control birth spacing, but it does not specify how this decision will be protected. There is no law against marital rape. And forced marriage is only forbidden at the register, or civil level; the law does not protect women and girls from forced marriages that are conducted at a religious or customary level.

Religious and Cultural Roles

Religion is important in Burkina Faso, and not believing in a religion is viewed negatively. The majority of people are Muslim (62%). The next largest religion is Catholicism. Additionally, many traditional religions, animism, and Protestantism are also practiced (CIA 2013). However, older women accused of witchcraft face ostracism by their communities.

Cultures vary in Burkina Faso due to the large number of ethnic groups that make up the population. However, in general, the Burkinabe culture is highly hierarchical based on wealth and gender. Women are subordinate to men and are in charge of domestic and household work. It is a woman's role to get married, have children, and care for her family.

Issues

A major issue for Burkina Faso is poverty. About 47 percent of the population lives below the poverty line (CIA 2013). Poverty leads to problems with education, health, and the economy. In 1995, the government of Burkina

Faso took a stance to eliminate poverty, and in 2000, a poverty-reduction strategy was launched with the goals to improve the economy and income for the poor. This strategic plan also tackles the challenges of social inequalities, access to food and water, improving social services, and combating illiteracy for the poor (Ki and Ouedraogo 2006).

Another issue that is facing Burkina Faso is that it has a high birth rates and a low older population. The population is very young, with about 65 percent of the population under the age of 25 (CIA 2013).

Finally, many people in Burkina Faso face malnutrition. Malnutrition is a severe problem for the population, especially for children. One in three children has stunted growth due to malnutrition and eight in ten are anemic (Mbugua 2015). Thirty-seven percent of children under the age of five are underweight (SOS Children 2016). Droughts have affected crops, which has affected income and food sources.

C

Central African Republic

Overview of Country

The Central African Republic (CAR) is a densely populated country in the middle of the African continent that shares borders with the Republic of Congo, the Democratic Republic of Congo, Chad, Sudan, and Cameroon. In July 2014, the 239,400 square mile landmass of the CAR was estimated to home over 5 million people (CIA 2014). According to the *CIA World Factbook*, 740,000 of these people lived in the capital city of Bangui in 2011 (2014). French is the official language of the CAR, yet Sango is also a principal language, as it is spoken by “nearly nine-tenths of the population” (CIA 2014; “Central African Republic” 2014). Sango is a pidgin language, which arose from the impact that French traders and missionaries had on an indigenous language from the Ubangi River region. Additional indigenous languages of CAR include Bangi, Ngbaka, Hausa, Lingala, Shuwa Arabic, and many others (“Central African Republic” 2014).

In early history, prior to the establishment of imposed national borders, language was a common method of social grouping. Bantu-speaking peoples migrated into and through the CAR approximately 2,000 years ago, and a Bantu language continues to be spoken among minority indigenous groups, such as the Ba’Aka, who are purportedly descended from hunter-gatherers who occupied the

region prior to colonial encroachment. (“Africa: Human Geography” 2014). A few sources also list the Mbuti, Twa, and Mbenda peoples as minority groups who currently live in the CAR and represent ancestors of the first hunter-gatherers (Minority Rights Group Int’l 2008; Exploring Africa 2014). Between 2008 and 2014, descendants of the hunter-gatherers made up less than 2 percent of the population (CIA 2014; Minority Rights Group Int’l 2008). However, there is limited information about the population prior to Bantu speakers. Additional ethnic groups living in the CAR today include Gbaya, Banda, Mandija, Sara, Mboum, M’baka, and Yakoma (CIA 2014). Religious and cultural belief systems of various groups include indigenous, Christian, and Muslim practices.

Inhabitants of the CAR have a lengthy history that necessitated protecting their bodies, land, and resources from the global North. The transatlantic slave trade that operated throughout the 16th to the 19th centuries affected various peoples and regions in distinctly different ways. While the inhabitants of Western Africa were most susceptible to inhumane treatment solely based on their geographic location on an oceanic trade route, people native to the region that would later become the CAR were also forced into enslavement based on ethnocentric assumptions of European invaders who believed that Africans lacked civilization. Contrary to this assumption, many kingdoms existed throughout precolonial Africa. The Luba and Lunda empires were the nearest established kingdoms

to what is now recognized as the CAR. They were located southwest of the contemporary CAR, residing partially in what is the Democratic Republic of Congo.

It was during the 19th century that multiple countries, including Belgium, France, Great Britain, and Germany, competed for colonial rule of what is now known as the CAR. France was ultimately successful in establishing what became known as French Equatorial Africa after claiming five territories: French Congo, Ubangi-Shari (or Oubangui-Chari in French), Gabon, Chad, and French Cameroon. What was called Ubangi-Shari under French colonial rule became known as the Central African Republic upon gaining freedom from France in 1960. While the territories' name, Ubangi-Shari, was derived from the names of local rivers, this should not suggest a cooperative sharing of the territory or culture between the indigenous peoples and France. Rather, colonial rulers attempted to avert direct rebellion through the appropriation of certain aspects of culture, such as indigenous language. The land was not identified in this way by peoples native to Africa prior to colonization. In the colonized Ubangi-Shari, Centraficans' (people from CAR) agricultural self-sustainability was undermined as peoples native to the CAR were made to work for European individuals and companies to advance the economy of the ruling nation. A lack of sustainable agriculture combined with exposure to a new population placed inhabitants of the CAR at risk for new illnesses and food shortages.

Although freedom from colonial rule was an integral accomplishment in establishing political and national identity, the country continued to undergo transition and endure ongoing turmoil due to power imbalances and disparate resource distribution between the global North and the global South. Freedom from colonial rule did not equate to a restoration of the CAR's true history. Instead, a new period of indirect cultural and economic subjugation began.

With a history that includes enslavement and commodification of citizens and imposed imperialistic politics, economy, and belief systems, the CAR inhabitants have endured a long history of conflict and structural inequity resulting from the leadership of those who took power by unjust, forceful, and sometimes violent means. A history of colonialism also influenced the country's political and economic stability. An environment that previously relied heavily on sustenance agriculture transferred to a system of export crops to meet the demand of neoliberal global commerce. Markets were designed by the global

North to dictate the terms of loans and the management of cash crops, including coffee, cotton, and diamonds. Despite mining and agricultural potential, the history of colonization and the impacts of global inequity have created political instability and overwhelming national debt, contributing to the CAR being ranked one of the most impoverished countries in the world, ranking 180th out of 186 countries listed in the 2013 UN Development Programme's Human Development Index (HDI), with two-thirds of the population living below the poverty line (Malik 2013).

Women living in the CAR today are directly impacted by the country's history. Colonial rulers endorsed patriarchal belief systems and created policies with rigid gender roles to maintain disparate power systems. Because the CAR continues to struggle for political and economic stability, women remain vulnerable and have the fewest opportunities to meet basic needs. Females have decreased access to education, reproductive choices, and opportunities to support themselves economically. They are at increased risk for sexual assault, domestic servitude, and poverty. Women in the CAR work to balance traditional reproductive roles with their contribution as "productive" laborers. Like other countries, a Centrafican woman's experience depends on many factors: socioeconomic status, region, urban/rural, religion, religion, and so on.

Girls and Teens

Female children in the CAR are raised according to cultural gender norms that dictate their roles in society and highlight the importance of reproductive capacity in determining women's worth. Few girls attend secondary school or seek professional careers as productive laborers. Most girls living in both rural and urban locations are raised in preparation for marriage and motherhood. It is the duty of mothers to equip daughters with the skills to care for the health and well-being of a family. Older sisters who are practicing for their future roles are often referred to as "mama kété or 'little mother'" (Woodfork 2006, 106). Marriage is seen as critical before giving birth to a child. Unmarried girls who become pregnant while attending school usually must abandon their education regardless of personal aspirations. While single parenting poses additional challenges to young women in the CAR, it is more socially advantageous to give birth young or unmarried than to be marked as incapable of conceiving (Woodfork 2006, 107, 112).

Because marriage is the expected goal for females in the CAR, over 50 percent of girls are married before their 20th birthday (UNICEF 2014). In fact, despite the fact that the law establishes 18 as the minimum age of marriage, an estimated 61 percent of women between the ages of 20 and 24 were married before the age of 18, and 21 percent were married before the age of 15 (U.S. Department of State 2014b). CAR has the fifth-highest early marriage rate (Myers 2013). Cultural norms as well as official policies dictate women's subordination to men, relegating females to societal positions for which recognition and esteem is attained through reproduction and reproductive labor. A young woman's livelihood is largely dependent on an economically supportive husband and not her own academics or profession.

As of 2011, there were no laws protecting children from sexual exploitation, including statutory rape and child pornography (U.S. Department of State 2014a). Officials do not effectively enforce laws against rape, and no minimum sentence is attached to the underrecognized crime (U.S. Department of State 2014b). Political unrest also contributes to the abuse of young girls. The United Nations Human Rights Council (UNHRC) reported rebel groups committing atrocities against children between the ages of 2 and 17 (U.S. Department of State 2014b). Gendered violence is rarely reported.

Social standards and belief systems surrounding menstruation also sanction hierarchical gender roles, exposing girls and young women to treatment as outsiders or "others" by the onset of puberty. Although celebrated for fecundity, women's physiology is also precarious, easily associated with blame or understood as dangerous: "Their menstrual blood is reputed to be so powerful that women are not permitted to walk across the fields while they menstruate because if one drop should fall, no plant would grow" (Woodfork 2006, 102).

Education

Due to the reproductive expectations and limited opportunities for professional development impacting girls and women, pronounced gender gaps are evident in access to education and literacy rates. Between the years 2008 and 2012, the recorded literacy rates for males between the ages of 15 and 24 was 72.3 percent, yet females of the same age group had a literacy rate of only 59.1 percent (UNICEF 2014). Access to formal education is limited for both males and females in the CAR, with 59.5 percent of

females and 78.4 percent of males participating in primary school and only 10.1 percent of females and 18.2 percent of males regularly attending secondary school (UNICEF 2014). Fewer than 1 in 200 girls go on to attend university (Gender Discrimination in Education 2012). Education in the CAR is compulsory for a minimum of six years until the age of 15; however, according to a 2007 UNESCO study, 65 percent of girls are enrolled in the first year of primary school, and only 23 percent remain for the entirety of the six years (U.S. Department of State 2014a). The majority of girls drop out of secondary school by the ages of 14 and 15 due to societal pressure to marry and bear children (U.S. Department of State 2014b). An additional barrier to education for girls is the threat of violence. According to a 2011 report, "42.2 percent of secondary school boys in Bangui admitted having perpetrated sexually violent acts in or around the school" (Van der Gaag 2011, 68).

Girls who present additional markers of social subjugation and those directly impacted by armed conflict encounter additional challenges. Ba'Aka children rarely attend primary or secondary school due to a combination of factors, including social marginalization, indigenous cultural belief systems, and a lack of government assistance or incentive. While gender roles are a predominant factor in examining access to education, political conflict in the CAR has also contributed to a loss of educational stability, which is further discussed below. By 2014, the closure of public schools had impacted approximately 800,000 children (U.S. Department of State 2014b). As a response to the challenges of political uncertainty and territorial violence, the United Nations is establishing temporary classrooms in an area in which many schools have been destroyed by civil warfare (UN News Centre 2014).

Health

Access to Health Care

"The entire health care delivery structure in Central African Republic, has been heavily disrupted, and basic services are completely absent in many locations," says Dr. Michel Yao, the World Health Organization's (WHO) representative to the country. "Most of the services are being provided from outside, making it difficult to scale up, reach people in need, and provide them with medical assistance. One key problem is that so many health workers have fled their posts due to the insecurity" (WHO 2014b). The situation in the Central African Republic has been compared

to the crises in South Sudan, Iraq, and Syria and the West African Ebola outbreak. Some data are available for basic health statuses, but many are in flux and deteriorating. “Half the health facilities outside the capital, Bangui, no longer function. In some regions, more than 75 percent of health facilities are unable to offer basic services. One-third of district hospitals cannot provide emergency services; two-thirds of immunization services are not functional and only a quarter of ambulances are operating. These skeletal services are working largely due to the 60-plus health care providers that are working with WHO in the country” (WHO 2014b).

The CAR spent 4.2 percent of its GDP on health care in 2014. Life expectancy is only 54 years for women and 51 years for men. Forty percent of the population is under the age of 15, and the median age is 20 (WHO 2015). Only 4 percent of the population lives in urban areas, and this impacts people’s access to health care.

Improved drinking water is available to 67.1 percent of the population, but the disparity between urban and rural areas is evident; 92.1 percent have access in urban areas compared to 51.1 percent in rural areas (UNICEF 2015). Only 33.8 percent has access to sanitation facilities: 43.1 percent urban and 27.8 rural (WHO 2015). Equity gaps continue to persist, especially in rural and remote areas. And ongoing fighting and instability make these numbers unstable and likely higher for the actual population.

Maternal Health

Only 19 percent of women in the Central African Republic use some form of modern contraception; the fertility rate in 2012 was 4.5 (down from 5.8 in 1990) (WHO 2015; UNICEF 2015). For a woman between ages 15 and 49, there is a 47 percent probability that she will be ill or die from maternal causes. The maternal mortality rate is very high: 880/100,000 in 2013. Only 38 percent of women attend four or more antenatal appointments, and 40 percent are attended by a skilled birth assistant for delivery. The mortality rate for children under 5 years old is also high, with 139 per 1,000 children dying. The leading cause of death for children under 5 years old is malaria at 16 percent (WHO 2015).

Abortion is prohibited except to save the life of the mother. Little information about prevalence is available, but it is suspected that abortion is common. There is concern that the pregnancy rates for adolescents is high, and the likely pursuit of abortion is also high. Unsafe abortions

are dangerous and can contribute to lasting health issues for women and girls.

Diseases and Disorders

Only 25 percent of children are vaccinated against measles, and, as mentioned above, immunization services have been severely limited. Malaria accounts for 115.4 per 100,000 deaths, and while these rates are going down, they remain one of the country’s most pressing health problems (WHO 2015). Between 2008 and 2012, 36.4 percent of children slept under insecticide-treated nets (ITN), and 47.2 households had at least one ITN (UNICEF 2015). In addition to malaria, watery diarrhea, physical trauma, and malnutrition are of deep concern within the country and for the international aid community.

As in many African countries, HIV/AIDS is the leading cause of death in the Central African Republic at 17.2 percent (248.2 per 100,000 people), followed by diarrheal disease at 11.2 percent (WHO 2015). There are gendered differences in comprehensive knowledge about HIV; 26.1 percent of young men ages 15 to 24 versus 17.3 percent of young women could demonstrate comprehensive knowledge. For the poorest young women, this number is 14.1 percent, and for the richest 23 percent. The prevalence of condom use among young men ages 15 to 24 is 46.5 percent but only 34 percent of young women (UNICEF 2015). These numbers show that some of the most at-risk people do not have access to information.

Employment

In addition to providing a majority of the reproductive labor, including the care and keeping of home and children, women in the CAR also occupy a multitude of spaces in the workforce. In 2012, females over the age of 15 accounted for 72.5 percent of the economically productive workforce, actively providing labor for the production of goods and services (World Bank 2012). Careers for women are based not only on gender but also on class and socioeconomic status. Those who have access and opportunity to pursue higher education have attained employment in roles traditionally relegated to female workers, including teaching, nursing, retail, and government. However, most women who work for wages are not seeking a career but struggling to meet basic needs. Many women sell crops and handmade goods in local markets. While many female vendors are economically obligated to sell food and crafts,

artisans serve in an apprenticeship, extending cultural and familial traditions through basket weaving and the creation of pottery (Woodfork 2006, 66). Artisans' roles, like other forms of employment, are based on gender. For example, "Gbaya women make the pottery and the men do the weaving" (Woodfork 2006, 66). Artisans are typically afforded the time and freedom to explore their craft. Their goods represent tradition, and their functional art is salient to local culture (Woodfork 2006, 66).

Women in the CAR represent a majority of the agricultural workforce, although they do not have rights to the land they farm. Historically, this can be traced back to the oppressive influence of colonial rulers from the global North, such as King Leopold of Belgium, who expressed the opinion that wives of enslaved African men would work the plantations of the state (Samarin 1989, 188). Although the constitution guarantees equal rights to women and men, including one's ability to own property, the customs and traditions of the country are the defining factors in a woman's ability to profit from her own labor.

Women in rural areas and women from minority groups, such as the Ba'Aka, generally suffer more discrimination than women in urban areas (U.S. Department of State 2014b). For example, the Ba'Aka are most susceptible to becoming victims of forced agricultural labor (U.S. Department of State 2014b). Children also participate in agricultural labor, especially in rural areas, regardless of child labor laws. Legally, children must be between 12 and 14 to seek employment; however, children as young as 7 frequently perform agricultural work (U.S. Department of State 2014b). In urban areas, such as the capital, Bangui, an estimated 3,000 children work as street vendors (U.S. Department of State 2014b). Young street children predominantly identify as those who have lost parents to HIV/AIDS and are accused of practicing sorcery (U.S. Department of State 2014b).

Women and children fill the lowest wage positions. For example, the monthly minimum wage for government workers is three times the compensation received by agricultural workers (U.S. Department of State 2014b). In addition, minimum wage requirements only apply to formal sectors, and many arrangements are private and unregulated. While policies and laws exist to protect the rights of workers in the CAR, officials are often unable to enforce legislative standards due to corrupt and unstable politics, which results in commonplace violations of workers' rights (U.S. Department of State 2014b). There is also a lack of gender-specific policies or laws preventing

discrimination or harassment in the workplace based on sex, gender identity, or sexual orientation.

Family Life

A history of colonialism and neocolonial politics is not only apparent in the economy, politics, and geographical borders of the CAR; it is also relevant in analyzing contemporary sociocultural dynamics such as gender roles. When involvement in politics is limited and a population's culture is threatened, marginalized groups, such as women, who have been silenced may mimic or join their oppressors as a method to regain what was lost. Imperialistic beliefs that were imposed on inhabitants of the CAR during French colonial rule also affected women's productive and reproductive autonomy.

Prior to colonial rule, women possessed greater sexual agency and received increased respect for contributions beyond their ability to bear children. Females owned possessions, shared in cooperative decision-making processes, and were able to initiate divorce (Woodfork 2006, 100). Land was divided among community members based on need before the French introduced landownership and consumer agriculture in the early 20th century. It was then that women became defined as legally subordinate, followed by socially inferior, to men based on their inability to own land or seek divorce. In many ways, women still encounter limited opportunities due to the sociocultural norms. Although the constitution now states that men and women have equal rights to own property, traditional laws and practices govern societal perceptions of land rights, with land typically passing from father to son, offering women extremely limited access to land rights (USAID 2010). According to the 2013 *Human Rights Report*, women in the CAR are treated as men's subordinates both economically and socially (U.S. Department of State 2014b). For example, single or widowed women, including those with children, are not considered heads of households, which translates into government subsidies only being accessible to men. Social norms affirm that the family of a deceased man has the power to evict his widow and their children from marital property because women are considered to be land users rather than landowners in the CAR's patrilineal culture (USAID 2010).

Cultural gender roles impact sociocultural beliefs pertaining to domestic violence, which is prevalent in the CAR despite laws that "prohibit violence against any person" with attached penalties of up to 10 years in prison (U.S.

Department of State 2014b). Although the law prohibits rape, no such protection exists for married women. As recently as 2012, not only did 80.3 percent of men justify spousal abuse, but 79.6 percent of women also rationalized beatings females received from male partners (UNICEF 2014). These beliefs start at an early age, with 79.4 percent of adolescent females also justifying wife beating (UNICEF 2014).

Double standards are applied to extramarital affairs; men are treated differently than women. Both monogamous and polygynous marriages are acceptable, but different groups practice each based on gender, socioeconomic status, location, religion, and tradition. Polygyny is legal in the CAR, and men are able to take up to four wives (USAID 2010). Monogamy is favored by Christians, most women, and those with Westernized views; however, polygyny is common, and some consider a lack of partners (or wives) to be going against tradition (Woodfork 2006, 122).

Despite fluid definitions of loyalty within marriage, adultery is a serious transgression when committed by a female. A man who suspects adultery can ask for a return of the bridewealth and will typically be justified in physically reprimanding his wife. For example, “In the case that a man catches his wife in the act of having sex with another man, the murder of the wife and the sexual partner are excusable” (Woodfork 2006, 101). In a 2009 international study, 25 percent of women surveyed in the CAR openly communicated that they had experienced domestic violence, and no evidence of any efforts to punish perpetrators of rape and domestic violence were discovered by those conducting the 2013 report on human rights practices (U.S. Department of State 2014b).

Although the statistics may appear discouraging, family is deeply treasured in the CAR, with each member appreciated for their individual contributions. Marriage is a highly valued institution, and family groupings are complex units representing tradition and (relative) safety. Respect is integral to social interactions, with elders receiving great esteem and ancestors regarded as part of the extended family (Woodfork 2006, 113, 130). Inhabitants of the CAR rely on family and friends within their community for support and expect to offer reciprocal assistance when their own neighbors are in need.

Reproduction

The average woman in the CAR will give birth to four or five children during her lifetime, based on the 2012 total

fertility rate (UNICEF 2014). Unfortunately, maternal, perinatal, and childhood mortality rates are high. For example, 1 in 26 women and girls risk losing their life due to complications from childbirth (UNICEF 2014). In a voluntary initiative, the CAR is committed to increasing health-sector spending from 9.7 percent to 15 percent, with 30 percent of the health budget focused on women’s and children’s health according to a development initiative published on the United Nations Web site (United Nations 2014). Although rates of maternal mortality are high and only 53 percent of women report a skilled health care provider attending their birth, a lack of technological intervention may also allow the CAR to adhere closer to the reproductive standards of the World Health Organization than high income countries of the global North (UNICEF 2014). Current cesarean rates in the CAR are only 4.5 percent of all births, while countries in the global North exceed maximum World Health Organization cesarean rates guidelines by 5–31 percent (WHO 2014; Gibbons et al. 2010).

Children are highly valued in the CAR, and women are celebrated for their fertility. Abortion is illegal in the CAR, with no exceptions permitted, and is punishable with fines and up to five years’ imprisonment (UN Population Division 2002). In fact, even survivors of brutal sexual assaults are forced to bear the children of their rapists. A 2006 study cites that inadequate access to contraceptives as well as apathy and disdain for women contributes to 19–20 million unsafe abortions performed worldwide, 97 percent of which occur in low-income countries (Grimes et al. 2006). The United States reinforces unsafe practices that place women and girls at risk with an abortion ban imposed on all foreign aid to areas such as the CAR.

According to UN data collected between 1990 and 2011, only 9 percent of women and girls between the ages of 15 and 49 who were married or involved in a monogamous relationship used a reliable method of contraception (U.S. Department of State 2014b). Having limited contraceptive choices is a representation of the cultural value tied to fertility and children, patriarchal values impacting women’s reproductive autonomy, and high rates of sexual violence. However, use of contraceptives is rising. Between 2008 and 2012, approximately 15 percent of women between the ages of 15 and 49 in monogamous relationships reported using contraceptives, illustrating an increase of 6 percent (UNICEF 2014). By 2012, at least 34 percent of females between the ages of 15 and 24 who had sex with multiple partners reported using condoms (UNICEF 2014).

Sexuality

There is very limited information on same-sex relationships and LGBTQ+ issues in the CAR due to a focus on meeting the immediate basic needs of people who are impacted by poverty and political conflict and a lack of documentation of precolonial indigenous belief systems regarding sexuality. Current beliefs dictate that marriage is the goal of all relationships, and the purpose of marriage is to produce offspring and join two or more families (Woodfork 2006, 115, 121). Marriage is not solely about the needs or desires of the individuals within the relationship; it is a representation of culture, tradition, and respect in the family and greater community. Many inhabitants of the CAR today suspect that the existence of same-sex relationships is directly related to Western influence (U.S. Department of State 2014a).

It is also probable that the authoritative governmental position on same-sex relationships impacts societal views. According to the U.S. Department of State, “The penal code criminalizes consensual same-sex sexual activity,” and “the penalty for ‘public expression of love’ between persons of the same sex is imprisonment for six months to two years” (U.S. Department of State 2014b). People in same-sex relationships that are charged with public displays of affection can also be charged fines equal to approximately two years’ worth of wages. In addition to official policies, there is widespread sociocultural discrimination against people who are perceived as gay, lesbian, bisexual, or transgender (U.S. Department of State 2014b). Due to political and societal perceptions of same-sex relationships, there is an absence of organizations advocating for LGBTQ+ rights in the CAR.

Politics

Women are poorly represented in the country’s political and administrative bodies, despite a national dialogue asserting that women are to occupy 35 percent of political positions. The CAR ratified the CEDAW convention, widely referred to as the women’s bill of rights, in June 1991, and it entered into force the following month. Female participation in the CAR government accounted for only 12.5 percent of influential positions (Inter-Parliamentary Union 2012). Additionally, “fewer than 3 percent of judges and lawyers in the country are female, and legal-aid services in the country are limited” (USAID 2010, 7). Disparate and inequitable access to education and hierarchal gender roles

result in women’s decreased ability to assert their legal rights or seek political careers. Although many laws exist to protect women’s rights, the *Human Rights Report* notes that underfunded programs as well as corrupt officials contribute to ineffectual policies (U.S. Department of State 2014b).

Political structure in the CAR is modeled after France and includes a president and prime minister. Theoretically, the president serves as head of state and head of government within a governmental model in which a president is elected by the people to complete a six-year term, with a prime minister appointed by the president. However, inhabitants of the CAR have learned systems of domination from self-appointed colonial rulers, slave traders, and the lived experiences of equating wealth with power locally and transnationally. Various officials have obtained political power using violent and inequitable methods, and many leaders have been overthrown throughout a history of civil conflict. A contemporary example was the 2013 self-appointment of president Michel Djotodia. The Séléka leader ruled for nearly one year before being replaced by the prior mayor of Bangui and first female to be appointed to the post of interim president. In January 2014, Catherine Samba-Panza began her role by “strongly call[ing] on the fighters to show patriotism in putting down their weapons” (Katz 2014). She went on to state in her inaugural address that “the ongoing disorder in the country [would] not be tolerated” (Katz 2014).

The CAR has endured a history of political instability associated with guerilla warfare. The Séléka and the Lord’s Resistance Army, which is scattered throughout the Democratic Republic of Congo and the Central African Republic, are known for abduction, rape, amputations, murder, and the recruitment of youth to forcefully commit violent atrocities against civilians. In January 2014, the United Nations reported over 6,000 children currently recruited as soldiers, with many young girls becoming the victims of sexual slavery (UN News Centre 2014). Although the number of girls and women that suffer sexual assault in conflict areas cannot be accurately documented, in 2011, the Lord’s Resistance Army had kidnapped over 360 youth for some form of servitude (U.S. Department of State 2014a). Advocacy and peace work have been successful in decreasing the number of children involved in armed combat; however, armed groups continue to use children as young as 12 years old in positions as lookouts and porters (U.S. Department of State 2014a).

Although many children and their parents are eager to witness an end to conflict with the hope of pursuing an

education, the country's current infrastructure does not support these goals. Widespread poverty and the destruction of physical environments decrease options for CAR youth. Communities that attempt to protect their children from becoming forced combatants and sexual slaves find they must employ these very children as members of self-defense committees to protect their families and the community (U.S. Department of State 2014b).

Religious and Cultural Roles

According to the 2003 census, the population of the CAR is 51 percent Protestant, 29 percent Roman Catholic, and 15 percent Muslim (U.S. State Department 2014d). The *International Religious Freedom Report for 2012* goes on to report that the remaining 5 percent practice animistic indigenous beliefs (2014d). However, the *CIA World Factbook* indicates that the population is 25 percent Protestant, 25 percent Roman Catholic, 15 percent Muslim, and 35 percent spiritually indigenous (CIA 2014). Several sources assert that animistic beliefs are central to many aspects of spirituality in the CAR and are incorporated into both Christian and Islamic practices (CIA 2014; U.S. State Department 2014d). The government acknowledges Christian celebrations as national holidays, but Islamic holy days are only recognized on an individual basis (U.S. Department of State 2014b).

Political strife in the Central African Republic influences all other areas of life, including religious freedom. Muslims in the CAR are in immediate and life-threatening danger due to the misdirected anger of Christian citizens who were targeted under Séléka rule. Muslims, who constitute almost one-sixth of the CAR population, are suffering a backlash on their beliefs and persons as the Christian militias invade and “cleanse” the towns following the successful removal of the violent Séléka leader, Djotodia, in January 2014. For instance, CNN reported that over 100 Muslims were killed in Bossemptele in January 2014 during one of these raids (Smith-Spark 2014). Followers of Islam are being forcibly removed from their communities with violent results. The *Wall Street Journal* reported that “1,300 of the last remaining Muslims in [the] capital city left on Sunday, escorted by African peacekeepers through a gauntlet of jeering Christians after months trapped in a squalid camp surrounded by lynch mobs” (Hinshaw 2014). Many sought brief refuge in churches and camps along the way as they escaped religious persecution.

Under the threat of losing their homes, children, and possibly their lives, Muslim females encounter unique challenges. For example, before Fatimatu Yamsa was murdered, along with her sons, she had entrusted the life of her infant daughter to a Christian woman who vowed to pretend that the baby was hers. Baby Shamsia, who had been safely delivered to her uncle's home after the tragedy, turned 8 months old in March 2014. A young girl's life was saved by two women who understood that their shared experiences as mothers was more salient than their religious differences (Raghavan 2014).

Although the CAR Constitution supports freedom of religion, the ostracism reaches beyond Muslims to those accused of sorcery or witchcraft. A majority of those accused of witchcraft are women, especially those lacking familial support, and they are “often subjected to mob violence, imprisonment, or death” (U.S. Department of State 2014b). In 2011, a woman in Bangui received death threats from neighbors after being accused of sorcery, and she was subsequently placed in police custody for more than six months to ensure her own safety (U.S. Department of State 2014a). In another example, five women accused of sorcery in 2011 were beaten and tortured by members of the People's Army for the Restoration of Democracy (APRD) (U.S. Department of State 2014a). Consequently, one woman died of her injuries. The government inadvertently encourages the subjugation of perceived practitioners of sorcery by listing witchcraft and sorcery as criminal acts punishable by 5 to 10 years in prison and a small fine (U.S. State Department 2014c).

Issues

Impact of Conflict on Women's Lives

Recent conflict and politics have played a ubiquitous and often terrifying role in women's lives. Within a one-year time span (2013–2014), citizens of the CAR witnessed a multitude of violent atrocities during civil warfare, followed by the transition to the country's first female president. Although the chronic stress of living in an environment of combat is challenging for all residents of the CAR, women and girls are at increased risk, particularly for sexual violence. Many victims of sexual or gender-based violence who seek medical treatment require surgery due to the atrocious extent of injuries (U.S. Department of State 2014b). Victims and survivors sometimes contract sexually transmitted infections, including HIV/AIDS, or become pregnant and are subsequently forced to bear the children

of their attackers. As recently as March 2013, women were attacked as rebels seized the capitol of the CAR, but with the collapse of the civilian administrative government, many police forces, courts, schools, and health care facilities were closed. (Mudge and Pennec 2014).

The 2013 *Human Rights Report* documents that rape is used as a weapon against the population by both government forces and rebel armies (U.S. Department of State 2014b). Rape often occurs in the presence of the survivors' children and other family members (U.S. Department of State 2014b; Mudge and Pennec 2014). Although not an issue unique to the CAR or civil conflict, victims rarely report the crime to officials and are unable to seek medical assistance due to the social stigma attached to rape (U.S. Department of State 2014b). While multiple sources document crimes against female citizens, there is a lack of information on the number of female soldiers in the CAR and their experiences as victims or accomplices. It is also unreported whether complicity earns female soldiers some degree of immunity (U.S. Department of State 2014b).

Because of this violence and the collapse of many aspects of society, many women in the CAR have become refugees. A June 2014 report referencing the United Nations Refugee Agency (UNHCR) indicated that more than 29,000 inhabitants of the CAR were living in refugee camps in the Democratic Republic of Congo, and one-third were under the age of 18 (Furcoi 2014). As of 2013, the UNHCR reported over 225,000 refugees, asylum seekers, and displaced peoples within the CAR and over 430,000 originating from the CAR (UNHCR 2014). Unfortunately, the report does not include specific data on the numbers or ages of female refugees or gendered violence within refugee camps.

Female Circumcision

According to WHO's 2008 estimates, 25.7 percent of girls experience female circumcisions in the Central African Republic, which is a marked decrease from 36 percent in 2005 (http://www.unicef.org/publications/files/FGM-C_final_10_October.pdf). The CAR has seen a dramatic decrease and has a low prevalence rate compared to the other main 29 nations that practice female circumcision about which the United Nations has gathered data.

There are four different types of female circumcision, which range from pricking to a cliterectomy. Most circumcisions are performed by a traditional practitioner when girls are between 5 and 14 years old. More than 90 percent

of women in the CAR think the practice should stop. Young women 15–19 years old and women from poorer households are more likely to support the continuation of female circumcision than women ages 45–49 and women from richer households. Support for female circumcision declines with higher levels of education, and women who have been cut are more likely to favor discontinuing the practice. Muslims, Catholics, and other Christians practice female circumcision at similar rates, though the rates vary by region.

Gender, Power, and the Sexual Dynamics of HIV/AIDS

In 2009, there were 130,000 Centrafricans living with HIV/AIDS and 11,000 HIV/AIDS-related deaths (CIA 2014). In general, women in Africa have been uniquely susceptible to the primary infection, the development of AIDS, and fatality due to their global and cultural subjugation. Decreased access to wealth and health care and their dependence on men reduces the likelihood that women will seek timely quality treatment. A gendered focus on caring for family also impacts the improbability that women will receive all necessary treatment.

Although parents yearn to protect their family and women often place the needs of others ahead of their own, children continue to be negatively impacted by the HIV/AIDS crisis because of inequitable health care, institutionalized discrimination, and social stigma. By 2013, "an estimated 300,000 children had lost one or both parents to HIV/AIDS," and many children and families are accused of sorcery to increase social censure and ostracism (U.S. Department of State 2014b). The influence of civil conflict also uniquely impacts those seeking treatment for HIV/AIDS. According to the United Nations, the looting of medical supply stores by rebel forces resulted in 13,703 individuals at risk of missing antiretroviral treatment (U.S. Department of State 2014b).

Feminist Organizing and Grassroots Movements

Transnationally, peoples of all races, religions, socioeconomic statuses, and a confluence of additional identity markers participate in feminist movements as they advocate for the advancement of social, political, and economic equality for women and girls. In 2012, the Central African Young Feminist Forum was hosted in Brazzaville, and 40 women from Burundi, Cameroon, Congo, the Democratic Republic of Congo, the Central African Republic, and Chad participated (African Feminist Forum 2012). The women

examined personal experiences and systemic inequity while generating ideas for collaborative activism at sub-regional, regional, and national levels (African Feminist Forum 2012).

D

Democratic Republic of Congo

Overview of the Country

The Democratic Republic of Congo (DRC) is a country of roughly 71 million inhabitants, often called Congolese, located in the central region of Africa. Nearly 40 percent live in urban areas (World Bank 2015). It is the 11th-largest country in the world and the 2nd-largest country in Africa, with a landmass of 1,408,678 square miles. It shares a border with eight African countries: Angola, Zambia, Burundi, Rwanda, Uganda, Sudan, Central African Republic, and Republic of the Congo. Within the DRC, there are 10 provinces and one city. The provinces are Bandundu, Lower Congo, Equateur, West Kasai, East Kasai, Katanga, Maniema, North Kivu, Orientale, and South Kivu. Kinshasa is the capital city of the DRC. A small section of DRC land borders the South Atlantic Ocean.

The official language of the DRC is French, a remnant of its history as a Belgian colony. Though French remains the official language used by the government and media for communications and reporting, a number of Congolese people also speak an African language. Some of the more prevalent languages are Lingala, Swahili, Kikongo, and Tshiluba. These languages are sometimes associated with particular ethnic groups and may be utilized more often than French by members of particular ethnic communities at the same time French is the language of education after grade two.

The climate in the DRC varies by region. It is split by the equator and is largely considered tropical due to its proximity to the equator. The central river basin, which is hot and is close to the equator, and the eastern highlands, which are cooler due to altitude, are home to tropical rain forests; both areas see significant rainfall. Because of this, the DRC has the world's second-largest rain forest. It is a country ripe for agriculture because of this climate; many tropical fruits and vegetables thrive in the climate of the DRC.

Colonialism and Independence

The Democratic Republic of Congo, as with many other African countries, was colonized by Europeans in the 16th and 17th centuries. Prior to full colonization by Belgium's King Leopold II in the 1870s, British, Dutch, French, and Portuguese slave-trading merchants removed Congolese citizens for triangular trade with the United States and other European countries. Though many native Congolese were shipped to the United States and Europe as part of the slave trade, King Leopold II and his Belgian forces enslaved thousands of Congolese citizens to work the mineral-rich land, producing gold and other resources desired for cross-continental trade.

Formerly known as Zaire, the DRC was established in 1908 as a Belgian colony after King Leopold conceded control of the land to the Belgian government; it remained a colony until its independence in 1960. Since

its independence, the DRC has experienced decades of war. This is largely due to the autocratic style of ruling while under Belgian control. As a result, foreign interests took advantage of the lack of governance and infrastructure implemented prior to and immediately following independence.

The United States and European countries took particular interest in then Zaire during the Cold War era and fueled a coup to overthrow the first prime minister, Patrice Lumumba, to pave the way for Mobutu Sese Soko (1930–1997), who supported the U.S.’s and Europe’s stance in the Cold War and made the resources of the Congo available for the United States and European countries. Mobutu utilized the country’s rich minerals and natural resources as collateral to gain allies, fend off rivals, and enrich his own wealth. Mobutu’s reign is often considered a dictatorship by the Congolese, as he maintained regimes that kept him in wealth and power until he was eventually ousted from office in 1997 after 32 years of ruling (Enough Project 2015).

The violence that has ensued in the DRC since independence does not have one single cause or purpose. Because of this, the challenge for peacekeeping in the DRC includes deciding what areas of the DRC to address and with whom to start the efforts. The DRC is a country rich with minerals and natural resources; therefore, aspects of the conflict are rooted in who controls or has access to these resources. This in turn contributes to the unrest that often leads to violence. Following its independence from Belgium’s colonization, the DRC saw the rise of several militia groups, namely, the Democratic Forces for the Liberation of Rwanda (FDLR), the National Congress for the Defense of the People (CNDP), the Allied Democratic Forces (ADF), the Mai Mai Militia, and the Lord’s Resistance Army (LRA), who fight to gain control of resource-rich areas of the newly independent country. These militia groups’ power has waxed and waned in strength throughout the years following the DRC’s independence from Belgian control. Some have been destabilized by increased government involvement, but many still reign over resource-rich areas of the DRC, particularly those in the eastern part of the Congo, scattered along the eastern borders of North and South Kivu, and occupying large areas of the country near water sources, such as Lake Kivu and Lake Tanganyika.

Conflict between ethnic groups in the DRC is a large contributing factor in the violence. The DRC is home to more than 200 ethnic groups. The majority ethnic groups are the Kongo, Luba, and Mongo groups. The Hutus also constitute

one of the largest ethnic groups in the DRC. During the 1994 Rwandan genocide, the Hutus, the primary leaders of the genocide, were overthrown by the Tutsis for control of Rwanda’s government. As a result, roughly 2 million Hutus fled to the DRC and joined forces with Mobutu, the DRC president who had held control since 1965, to begin attacking the Tutsis in the DRC. During his final years of rule, Mobutu offered refuge to refugees from Rwanda seeking escape from the mass genocide enacted by the Hutu military against the Tutsi people. Mobutu also offered refuge to Hutus responsible for the genocide, causing violence to erupt in the DRC as Uganda and Rwanda invaded the Congo in 1996 in the search for Hutu militia taking refuge.

Hutu militia groups rose to power in the eastern region of the country, often called the “Great Lakes” region, and enacted violence on other ethnic groups of that region in an attempt to gain control of the region. The conflict between the Hutus and Tutsis led to years of the two ethnic groups jockeying for control of the DRC government, and many other ethnic groups fell victims to their conflict as militias developed to protect ethnic groups, regions, or a combination of the two. The lack of governmental control over natural resources and lack of military infrastructure to ward off militia groups continues to situate the DRC as a battleground for control over land and its resources.

Due to the years of conflict in the country, there is a significant population of internally displaced persons who are refugees from other parts of the DRC who migrate to other regions of the DRC as well as some neighboring countries, such as Rwanda or Burundi, for safety from ethnic conflict. Many of these people are women and their families who have been displaced due to the men who left their families, either by death or by joining up with one of the multiple militia groups roaming the country.

More than 75 percent of refugees from the DRC have fled to the neighboring countries Republic of the Congo, Uganda, Tanzania, Rwanda, Burundi, Zambia, and Malawi. The continued violence in the DRC makes it difficult for the Congolese to return, and legal rights are restricted in various ways in each of these countries; the legal right to work, access to education, freedom of movement, and access to citizenship are included in restrictions for refugees from the DRC.

The DRC Today

Through these conflicts between warring ethnic group militias and government forces, rape has consistently been

used as a weapon of war. War and violence are a defining part of the experience of many of those who have lived in the DRC over the past few decades, particularly women and children. More than 3.3 million deaths occurred because of the Congo Wars (1998–2002), many of whom were women and girls (Nzongola-Ntalaja 2004). In total, the era of violence in the DRC is said to have claimed roughly 6 million lives. It has also caused the DRC to be known as having the highest number of rapes per capita. This historical narrative about the DRC has made efforts toward equity for women a challenge, as women's presence has come as a peripheral presence, situating women as second-class citizens.

Out of the 187 countries the UN Development Programme (UNDP) assesses in their Human Development Index (HDI), a matrix of measuring the quality of life based on life expectancy, education, health care, and income, among other factors, the DRC ranks as number 186, an indication of the severe poverty and lack of critical resources DRC citizens experience as their daily reality. At 47.8 years, the adult life expectancy rate is low when compared to the world average of 69.4 or the rate of industrialized nations such as the United Kingdom, which has a life expectancy rate of 80.1 years. This is a sign of the lack of access to reliable health care and likelihood of experiencing militarized violence. The literacy rate in the DRC is roughly 15 percent lower than the world average and 32 percent lower than the United Kingdom's rate (World Bank 2015). Life in the DRC poses significant challenges, and the issues DRC folks face are intertwined, affecting all aspects of their livelihood and well-being.

Though the situation for women and children in the DRC has been dire in the past four decades, there have been improvements for women and girls in the DRC. There is an increased effort to focus on the needs and rights of women to be safe, to obtain an equitable education, and to pursue work and careers outside of the home. Multiple international agencies and government coalitions are working with the people of the Congo to realize a more equitable postwar society.

Girls and Teens

Girls and teens in the Democratic Republic of Congo have been subject to significant violence because of the various militia groups that have employed coups in villages throughout the DRC. Regular, systematic violence against women is part of the country's historical and

contemporary reality. This influences the larger issue of the treatment and status of women in the DRC. Because girls and women have become targets for rape and sexual violence, they are often viewed as second-class citizens in the DRC, and the opportunities afforded or not afforded to them reflect that status.

Recreation

Recreation for girls in the DRC is largely dependent on the status of their parents' wealth. For Congolese girls from more affluent backgrounds, who often live in urban areas like Kinshasa, there are opportunities for clubs and sports. Soccer is a popular pastime for many Congolese people, and affluent Congolese girls participate in organized soccer teams; those in less affluent areas may still play soccer informally. There are also organizations such as the Action Kivu, a Congolese nonprofit that offers basket-weaving courses to women and girls in the Congo, and the international Girl Scouts through the World Association of Girl Guides and Girl Scouts (WAGGGS). "The activities offered through Guiding give girls and young women an opportunity for self-development as well as responding to the needs of their immediate community" (WAGGGS 2016). Girl Guiding was first introduced in the DRC in 1928; by 2012, there were 13,958 Girl Guides in the DRC.

Due to the risk of being the target of violence, many rural Congolese girls, particularly those in the Great Lakes region, do not venture far from home. However, because of the close-knit villages, particularly in more rural areas, girls will play outside with other children. Additionally, many Congolese girls are taught how to do traditional crafts by their families, especially by the women in their families, as a source of entertainment and as a way to carry on such traditional practices as basket weaving, embroidery, and sewing. While this provides a pastime for Congolese girls, it can also provide income for some families who sell the wares they produce.

Recent nongovernmental organization (NGO) programs have provided opportunities for girls to find recreation in discovery and learning outside the traditional classroom. One NGO, Greenlight for Girls, focuses on encouraging girls to consider the possibilities of careers dedicated to science, technology, engineering, and mathematics (STEM). This program does so through providing girls with opportunities to understand how science and mathematics play a role in their lives through various hands-on projects. Externally funded—meaning not

funded by the DRC government—programs like these are seen by many as a way for girls to have fun while developing a sense of possibility for a future contributing to STEM knowledge in schools and communities in the DRC.

Family Roles

Girls in the DRC often take on roles of assisting with the household upkeep bestowed on mothers in DRC households. Girls may help their mothers with gathering produce for cooking, preparing meals, or even cleaning in the household. Older girls may also help with child care for younger siblings. As with the expectation for women's roles to be centered on the household, many girls help contribute to the care of the house.

Health

Women's and Girls' Health

Women do not have regular access to medical care in the DRC, largely due to the lack of health infrastructure. Though the population infected with HIV is low, with roughly 1.3 percent of the total population of the DRC testing positive, women are almost twice as likely as men to become infected with HIV (Women's Network for a Better World 2012). In 2013, it was estimated that there were 350,000 orphans due to AIDS (CDC 2014). Coupled with the high rates of children orphaned due to the armed conflict and violence, caring for these children is a priority for aid organizations to provide them with food, immunizations, and health care. Though female circumcision is illegal in the DRC, it remains a coercive practice in the northern region of the country by various militia groups.

The leading cause of death in the DRC is diarrheal disease, followed by lower respiratory infections and malaria. Malnutrition contributes to increases in people, especially children, with deficiencies of essential nutrients and makes the population more vulnerable to disease. Preventable and treatable diseases such as cholera, malaria, polio, and measles are common. The years of conflict have destroyed roads and health infrastructure, which makes it difficult for many Congolese to access the few hospitals and health centers that exist. International organizations such as WHO and UNICEF have been trying to meet basic health needs, but the dire need for doctors and other trained health care professionals makes it difficult to meet the needs within the DRC. According to WHO, for every 10,000 people, there is only one doctor and five nurses or midwives.

In 2014–2015, multiple countries on the western coastline of Africa experienced outbreaks of Ebola, a rare yet often fatal virus that causes hemorrhaging and organ failure. The DRC experienced a small outbreak in the summer of 2014, prior to the large Western Africa outbreak that was unrelated to the larger regional outbreak. The total number of reported Ebola cases in the DRC in 2014 was 66, 49 of whom died because of the illness (CDC 2014).

Years of being victims of sexual and gender-based violence have taken a toll on the psychological well-being of many women and girls in the DRC. Even amid these traumatic incidences of violence, depression is not recognized as a legitimate illness in the DRC. Though the psychological effects of sexual and gender-based violence are often treated with talk therapy, this practice is unfamiliar to many Congolese women and is not often utilized. There is less than one psychiatrist per 100,000 people in the DRC, and the mental health budget out of the overall health expenditures is nominal (WHO 2015). NGOs work with women to heal after the experience of sexual and gender-based violence, and some women are beginning to speak out against the violence they and many of their peers' experience.

Maternal Health

Women in the Democratic Republic of Congo see significant challenges in reproduction. Health facilities, where accessible, do not provide family planning services or quality maternity or postnatal services that are affordable, creating barriers for women from low socioeconomic conditions. In rural areas, many births are attended by a traditional birth attendant, who often does not have adequate medical training to respond in case of emergency. The lack of affordable access to care and the low number of birth attendants with medical training present challenges for women. The total fertility rate is 6.6, compared to a world average of 2.5 (Population Reference Bureau 2015). Of particular note is the early maternity rate; nearly 25 percent of women under the age of 20 have been pregnant. Abortion is illegal in DRC but roughly 36 out of each 1,000 women in the DRC have had an unsafe abortion. As a result of these issues and the lack of access to quality prenatal and postnatal care, women often struggle during pregnancy and birth with complications of bleeding during and after delivery and infections associated with delivery (Women's Network for a Better World 2012). In recent years, efforts by the World Health Organization to train birth attendants in essential newborn care (ENC) have slowly lowered the infant mortality rate.

Education

Education in the DRC has been structured like that of the colonizing Belgium, with primary, secondary, and university levels. However, the conflicts in the country have contributed to relatively low literacy, school attendance, and completion rates. Regional languages are only used in teaching until grade two and then the sole language of education is French. This contributes to the struggles of children in the country to advance from one grade to the next. Migration and large numbers of children living in inaccessible forests also contribute to the low numbers of children enrolled in and attending school. More than 3.5 million children do not attend school. Only 65 percent of children who enter first grade stay in school through sixth grade, and only 75 percent of those students pass the exit exam (USAID 2016). Only 5 percent go on to college, with the most wealthy going abroad for university studies.

Education accounts for 14.7 percent of the national budget, but the amount the DRC spends on education is still among one of the lowest globally. Educational disparities exist for girls and women, reflecting the larger social issue of gender inequality in the DRC. Parents are less likely to enroll girls than boys at the primary level; only 46 percent of those enrolled in the first year of primary school are girls. This drops to 39 percent of those leaving primary school with a certificate and starting secondary school (World Bank 2015).

Roughly 67 percent of the overall population in the country is literate; however, there is roughly a 20 percent disparity between the literacy rate for men (76.9%) and that for women (57%). This is likely caused by the three more years of school males are expected to receive than females. Only 10.7 percent of DRC females have at least a secondary education as compared to 36.2 percent of males (CIA 2014). Educational disparities are amplified for girls and women in rural areas of the DRC, where educational infrastructure remains less stable than in urban areas. Additionally, Congolese girls from more affluent families are able to access educational opportunities more readily than others, affording them the ability to pursue university study, unlike many of their less affluent female peers.

To address these long-standing disparities, international NGOs and government aid departments began investing in providing opportunities for schooling for the children of the DRC, with a special focus on schooling DRC's girls. Recent initiatives by the U.S. Agency for International Development (USAID) aim to address the

schooling of girls and women in the DRC. USAID, with the help of the Internet and radio, has developed teacher-training programs and provided scholarships for female students to pursue those programs. In 2014, USAID and the U.K. Department for International Development committed nearly USD\$2 million to improving literacy, attracting students back to school or to school for the first time, retaining students, and strengthening transparency to the public regarding education in the country. This program, with the Girls Education Challenge, a program focused on increasing girls' access to education and their successes in education established in 2013, demonstrates the recent efforts to attain educational parity for girls in the DRC. Though educational disparities for girls in the DRC are pervasive, there are attempts to address this, particularly for those girls in the Great Lakes region of the DRC.

Employment

The Economy

The economic structure of the Democratic Republic of Congo, though it has improved some in recent years, experienced challenges due to the First and Second Congo Wars, the first of which began in 1996 and the second of which officially ended in 2003. Though the poverty rate has dropped since the ending of these wars, 63 percent of the population of the DRC was considered as living below the poverty line as of 2012 (World Bank 2015). The most recent reported unemployment survey by Banque Centrale du Congo (the national bank of the Congo) found that roughly 46 percent of Congolese people are unemployed; the unemployment rate is not divided by gender, and it is likely that a much greater percentage of women are considered unemployed due to current cultural conditions and expectations. While the DRC ranks 18th in the world for the percentage of its population in the labor force, the gross domestic product (GDP) per capita is the lowest in the world (CIA 2014). These factors can be attributed to the reality of many Congolese people living in extreme poverty, often due to the unrest caused by coercive militia groups controlling land and impeding citizens' safety to work.

Economic exploitation remains a significant issue in the DRC, as militias continue to roam mineral-rich areas of the country, particularly in the Great Lakes region, in an attempt to control those areas for mining and eventual trade. Because of this illegal activity, the funds generated from this do not enter into the DRC's GDP. What this means for the people of the DRC is a weak economy

that does not infuse tax dollars back into social services and infrastructure building to ensure civilians' access to needed services. Coupled with this economic reality is the fact that the cost of items many in developed countries consider common sundries (e.g., clothing, electronics, and groceries) are significantly more expensive in the DRC than in a country like the United States. Communication technologies are also expensive to access; Internet access, though deemed unreliable, costs roughly USD\$130 a month after paying an initial equipment fee of roughly USD\$1300 (U.S. Department of State 2014). Overall, the economic situation for a majority of those who live in the DRC, particularly for women and their families who live in rural areas, is dire.

Careers

Women in the DRC struggle in terms of employment and careers. And those women who are able to pursue gainful careers in the DRC face economic instability in terms of their labor rights. There are restrictions on women's ability to manage finances. For example, women must have their husbands act as the signatory on key documents that allow for opening a bank account or securing a line of credit. These requirements inhibit the ability of women to act as entrepreneurs; they are unable to begin businesses on their own without the purview of a husband. Because of the lack of agency in finding gainful employment and managing personal finances, 61.2 percent of women in the DRC live below the poverty line (Mbambi and Faray-Kele 2010).

In recent years, however, some women are driving entrepreneurship in the DRC, helping to fuel the DRC's economy. Of those women who work outside the house, the majority of wage-earning women operate small businesses, selling clothing or food they have produced. Additionally, some women, particularly in more urban areas like Kinshasa, find work in offices, teach in schools, or work with community-based organizations. The DRC compulsory schools still lack the vocational programs necessary to ensure a workforce that is ready for trade-skilled employment or for success in agricultural production. And without the support for and enforcement of compulsory education for Congolese girls, women continue to struggle for employment outside the home. Additionally, of those women who work outside the home, many deal with pay inequality compared to their male colleagues.

Resources

The Democratic Republic of Congo is considered rich in natural resources. It is estimated that it may be one of the richest African countries because of the over 1,100 minerals and precious metals in its millions of acres of land (World Bank 2015). The eastern region of the country, where conflict endures most heavily, contains heavy deposits of gold, uranium, tungsten, and oil—resources desired by global markets, particularly for defense and technology industries. Of recent interest is the country's richness in coltan, a mineral used for the manufacturing of mobile phones; the DRC holds more than 70 percent of the world's supply of coltan. The mining of these resources is loosely controlled by the government; recent investigations into the financial beneficiaries of mines in Rubaya tie the profits back to the funding of militia groups such as M23.

The largest industries in the DRC are agricultural. Of all agricultural products cultivated in the DRC, coffee is the largest export. Other agricultural products that comprise a large portion of the agricultural growth in the DRC are sugar, cotton, tea, various fruits, palm oil, rubber, cocoa, cassava, bananas, plantains, peanuts, root crops, corn, and wood products. Though these crops thrive in the DRC's climate, only about 10 percent of the useable, farmable land is in operation; this is a result of the insecurity surrounding conflicts with militia groups (SOS Children's Villages 2015). There is limited data on the export of these agricultural products; many of these agricultural products are likely for subsistence, as one of the largest imports for the DRC is foodstuffs. Women perform the vast majority of the subsistence farming. Though it is considered one of the most mineral-rich countries in the world, there is a lack of governmental regulation over the mining and resource management in the DRC. As a result, many militia groups seize control of certain mines and areas of production, eliminating a revenue stream into the overall GDP of the country, which, in turn, does not elevate the quality of life for a majority of the Congolese.

Family Life

Marriage and the Household

Due to gender inequities in employment and education, women in the Democratic Republic of Congo are often forced to rely on marriage as a means of sustaining

themselves. There is a pervasive view among men in the DRC that women are property of the family rather than equals or valuable contributors. In addition, marriage often happens at a young age for women, as the legal marriage age for women in the DRC is 15, where the legal minimum age for men to marry is 18. Of those women between the ages of 15 and 19 years old, roughly 74 percent are married (Mbambi and Faray-Kele 2010). This, coupled with the lack of financial agency and lack of education, puts women, particularly those from lower income backgrounds and in rural areas, in a subservient role in many marriages in the DRC. The expectation of women to serve as domestic keepers, purchasing food and other goods for the household, stands in contrast with women's right to manage or keep money earned. This keeps women in a subordinate role in many households and reinforces women's lack of power in marriages, which tends to be the situation for many women in less industrialized, more rural areas of the DRC. There are women, particularly those living in urban areas such as Kinshasa who have more economic mobility, who have more autonomy in their marriages. They challenge the traditional familial structures by making and managing the money they make as professionals.

The DRC Family Code is one of three legislative books that comprise the Congolese Civil Code, which governs interpersonal legal matters. The Family Code establishes women as subordinate to their husbands. While the Family Code of the DRC establishes consent to marriage and reciprocal rights in marriage, it does not ensure reciprocity in families between husbands and wives. In the event the husband is absent, a relative of the husband has control over the family and its finances. Additionally, the code establishes women as unable to be a legal guardian, as women are considered incompetent in the Family Code. In the case of a divorce or marriage annulment, women must wait 300 days following the annulment before remarriage; this is not a requirement for men. The DRC Family Code, which has been challenged by the United Nations Committee on the Elimination of Discrimination against Women, situates men as having control over the household, placing women in an inferior position in their role in a family.

Traditionally, marriages in the DRC were arranged marriages, where the parents of a male and the parents of a female negotiated their children's marriage. In this scenario, the male's family was expected to pay a "bride-price," money or other items of value paid to the bride's

family to become a part of the family. If families negotiated this settlement and the female declined the marriage proposal, oftentimes the female would be forced into the marriage through kidnapping. Fortunately, this practice has lost traction in the DRC in recent years, and many marriages are entered into with mutual accord.

Many families in the DRC consist of more than a man, a woman, and their children. It is common to see extended family members living together. This allows for more shared responsibility for cultivating the crops on which families will subsist and tending to the needs of the household. In urban areas, particularly among more affluent urban residents, households may be much smaller, consisting of a nuclear family and perhaps an elderly generation, such as grandparents.

With more than half of its population living in poverty, it is estimated that about 6.3 million people in the DRC are food insecure, meaning they do not have a consistent source of food to sustain a healthy level of nutrition (World Food Programme 2015). This can be attributed to the lack of safe access to farmable land because of military conflict. Half of all the children under the age of five in the DRC are considered malnourished (WHO 2015). As military conflict raged in the DRC, many women were left to be the head of the household and solely accountable for the health and survival of their children.

Sexuality

The topic of sexuality in the Democratic Republic of Congo remains reflective of traditional African values. While the DRC does not officially have any laws that currently criminalize homosexual relationships, in 2010 a bill called the Sexual Practices against Nature was introduced in the DRC parliament in an attempt to criminalize homosexuality. Currently, lesbian, gay, bisexual, transgender, and intersex (LGBTI) individuals do not have protected statuses in DRC law, making them susceptible to discrimination and violence and without recourse when experiencing either.

Politics

The political history of the Democratic Republic of Congo is tumultuous. Due to years of colonial rule with minimal governmental infrastructure and a lack of shared government, the DRC experienced political ambiguity and subsequent turmoil in the years following independence.

Infrastructure

The Congolese government struggles to maintain order and rule over the country and has ceded control to local ethnic groups in some townships. Included in this secession of control is the reliance on NGOs and religious organizations to provide the services necessary for civic life. Health care and sanitary devices, such as water pumps, are often supplied by international NGOs, and religious organizations tend to provide opportunities for schooling in certain regions where the Congolese government struggles to provide or regulate infrastructure. This presents challenges for women, particularly in the realm of health and safety, as the reliance on NGOs for basic services does not necessarily result in a change of governmental funding priorities.

Leadership

In 2006, the DRC held its first multiparty elections for the presidency in approximately 40 years. Due to several candidates running for presidency and not one accumulating the necessary 50 percent to become elected, a second vote ensued, and in October 2006, Joseph Kabila became the first elected president of the DRC since 1965. Prior to Joseph Kabila, his father, Laurent Kabila (1939–2001), served as president from 1996 until he was assassinated in 2001. Laurent Kabila was the first president to follow Mobutu Sese Seko, who reigned as a dictator in the country for 30 years prior to 1996.

Women in Leadership

Women are underrepresented in politics in the DRC. After the 2006 elections, 42 out of 500 elected National Assembly deputies were women. This political representation disparity extends to the Senate, too, where only 4.6 percent of the senators and 6.8 percent of the provincial assembly deputies were women (Freedman 2011). As of 2012, only 8.2 percent of the parliamentary seats were held by women (UNDP 2013). The lack of women's participation in the political sphere is largely attributed to women's lack of access to financial resources to fund a political campaign.

The lack of women's voices in political positions further distances the DRC from realizing gender equality. Though the 2006 constitution calls for the elimination of gender discrimination and gendered violence, women in the country still struggle for equal rights, including the ability to run for political office. Current electoral requirements

state that political parties must attempt to recruit women into running for parliamentary office. There is scant evidence of implementation of the enforcement of electoral requirements. In 2011, the effort to recruit women into political candidacy was unsuccessful, as only about 10 percent of those women accepted an invitation to run. This stands in contrast to the goal of having nearly 50 percent of the positions in national offices held by women. It is believed that though this goal exists, the electoral commissions will not eliminate candidates or political parties that do not succeed in recruiting women into the party.

One challenge in recruiting women into these parties is their vocal position against sexual violence. Women who have spoken out against the systematic sexual violence enacted upon women in the DRC noted becoming targets for sexual violence as a result. In addition, the electoral law requires candidates to have, at a minimum, a three-year university degree; due to disparities in educational access for women, many women do not qualify.

However, women still attempt to take a stand in the future of their country and its views on women. A group of Congolese women living in the diaspora in Belgium organized the Collective of Congolese Women for Peace and Justice (CCWFPJ). The CCWFPJ aims to expose the horrors Congolese women and children experience and that the interest that international constituents have in the country's natural resources causes developed countries to maintain a level of neutrality and lack of human rights interventions in its dealings with the DRC. In a 2009 letter to then secretary of state Hillary Clinton, the CCWFPJ urged Clinton to influence the UN Security Council to do the following: establish the interrogation and prosecution of war crimes enacted upon DRC women; increase women's civilian and military roles in the United Nations' DRC stabilization unit, MONUSCO; require investigation, regulation, and reporting of natural resources mining and the consequent revenue stream from it; and enter into a peacekeeping dialog with Rwanda. Additionally, the CCWFPJ advocates for the prohibition of marriage before age 16 in an attempt to allow women to finish their education and potentially forge a pathway into civic and military leadership. This group of women living in the diaspora is critical to governmental policy changes for the well-being of Congolese women in the DRC because they are able to speak about the injustices women regularly experience in forums that will listen to their stories without retaliation. With the advocacy of these Congolese women living in the diaspora, NGOs and international organizations such as

UNESCO and MONUSCO seek to influence governmental changes in the DRC.

It is a shared belief by many international organizations and leaders and many Congolese women themselves that the only way to attain more widespread peace for the women and children of the DRC is to see women in leadership positions in the country. Because women are the primary victims of war and military conflict, they hold a pivotal role in securing peace. In 2013, the former president of Ireland, Mary Robinson, was appointed the UN special envoy to the secretary-general for the Great Lakes region, where much of the violent conflict occurs. Robinson advocates for the role of DRC women in peace efforts as critical. In this role, Robinson orchestrated the Peace, Security, and Cooperation Framework for the Democratic Republic of Congo and the Region, a document signed by 11 African countries to take regional, national, and international steps toward ending violence in the DRC and surrounding regions affected by the years of conflict. This international commitment with implementation accountability is a sign of hope for women to rise into leadership positions and for the violence enacted upon people, particularly women and children, in the DRC to subside.

Religious and Cultural Roles

Religions

Religion is a valued part of the culture of many Congolese people. For many, religion provides the mental and spiritual refuge needed to endure the ongoing violence that pervades the country. The religious makeup of the DRC is reflective of European colonialism and Western missionaries. The dominant religion in the DRC is Catholicism; roughly half of the population of the DRC identifies as Catholic. This mirrors other countries that were subject to European explorers who colonized the area and brought with them the mission of converting others to Catholicism or another sect of Christianity. Hence, 20 percent of the population identifies as Protestant, 10 percent identifies as Muslim, and another 10 percent identifies as Kimbanguist, which is a Christian Congolese church named after Simon Kimbangu, a priest who believed he saw Jesus Christ and was called to do the work of Christ, healing ailing Congolese in his time before imprisonment. Much of the remainder of the population subscribes to indigenous religions, though a small proportion of the population are Jehovah's Witnesses, Jewish, Mormon, or Greek Orthodox (U.S. Department of State 2011). While the DRC's Constitution

upholds religious freedom, the government maintains the power to legally recognize or derecognize and dissolve religious groups. Recent reports show no incidences of discrimination based on the religious affiliations of Congolese people.

Cultural Roles of Women

Historically in the DRC, women have been expected to be submissive, catering to the needs of a husband and family. Additionally, women have been expected to remain separate from public life, which contributes to their invisibility and status as second-class citizens. More recently, however, NGOs have worked with communities to see the value and importance of women. As more women gain skills through NGO-sponsored work and education programs, women are able to leverage economic decision making within their households and communities. However, women often continue to understand their cultural role of being submissive and are not permitted to speak up against a man. While the landscape for women's cultural roles is changing, their roles remain situated in patriarchal norms.

Issues

Rape and Sexual Violence

Sexual violence against women remains high, even after the official end of the Congo Wars. It is believed that married women are more susceptible to violence due to partner violence that occurs within the household. Because of their financial dependence on men, however, many DRC women who experience domestic violence either do not report their experiences or are silenced by their partners.

The Democratic Republic of the Congo, due to years of conflict and sexual violence employed in that conflict, has been referred to as "the rape capital of the world" (Bradley 2013). Girls and women in the DRC are continuous targets of rape and sexual abuse. Many of these abuses are committed by various militia groups, although government security forces and citizens-at-large are responsible for acts of sexual violence. The northeastern section, often referred to as the African Great Lakes region, is the site of much of the militarized violence.

In January of 2011, an alleged 40 women were raped in the town of Fizi, in the South Kivu, by military leadership; these military leaders were later brought to trial, convicted, and sent to prison (Dagne 2011). Though this is an example of justice enacted to address the raping of

Women's Voices

Julienne Lusenge

Julienne Lusenge of the Democratic Republic of Congo (DRC) is the president of Female Solidarity for Integrated Peace and Development (SOFEPADI), a coalition of 40 DRC women's organizations. She fights to end sexual assault against women, especially during wartime. Speaking at the United Nations Security Council's Open Debate on Women in October 2015, Lusenge said, "We cannot say that we have seen any real changes because until now women have been killed, raped and forced to become sex slaves." Besides serving as the president of SOFEPADI, Lusenge also founded the Fund for Congolese Women (FCW), an organization that funds grassroots women's initiatives.

UN Women. 2015. "In the Words of Julienne Lusenge: 'Women Are the First Victims of War' in the Democratic Republic of the Congo." December 1. Retrieved from <http://www.unwomen.org/en/news/stories/2015/11/in-the-words-of-julienne-lusenge>.

these women, these trials are not as common as the rapes that occur in the DRC, standing in opposition to the intentions set forth by the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) to hold perpetrators accountable for their violent actions against women. A May 2011 study indicated that 1.8 million DRC women were raped and that an average of 48 rapes occur hourly in the DRC (IRIN 2011). Women, particularly those who live in more rural areas of the DRC, do not have regular access to services, including medical help, lawyers, or law enforcement, which would help them to pursue justice in the wake of sexual violence. Additionally, many women do not report their experiences of sexual violence due to fear of rejection by their spouse, retribution by their perpetrator, or vilification by their community. The threat of sexual violence causes women to travel in groups or limits travel outside the home to travel necessary to attend to household needs such as seeking sustenance. In some situations, women wear additional clothing as a means to make rape or sexual violence harder to enact upon them.

The pervasiveness of rape and sexual violence extends beyond the conflict zones and into the psychology of the household and marital relationships. More than 70 percent of married Congolese women, age 15 to 49, state that their husbands have been violent toward them. Of those who report being victims of violence, roughly 75 percent believe that their husband was justified in enacting this violence (Women's Network for a Better World 2012). This speaks to the way in which the culture of rape and sexual violence has permeated into the collective consciousness

of the Congolese, including those women who have been victims themselves.

The massive incidences of sexual violence and rape have left significant health consequences on these female victims. Due to the force used, women are at a higher risk for contracting HIV, experiencing hemorrhaging or vaginal bleeding, mutilation or degradation of genital organs, and death because of infections contracted during or after experiencing sexual violence.

The issue of rape and sexual violence for women in the DRC has not gone unnoticed. The government of the DRC has taken steps toward seeking safety and justice for women in regard to rape and sexual violence. In 2009, the DRC drafted a National Strategy on Combating Gender-Based Violence to facilitate women's rights to medical care and legal help. In September of 2014, the United Nations Human Rights Council (UNHRC) met to discuss the progress of implementing these strategies. In this meeting, it adopted a universal periodic review of the country's progress on addressing, mitigating, and eventually eliminating sexual and gender-based violence. One of the commitments made by the DRC because of the national strategy and subsequent review was to begin trying military agents, such as those that attacked the women of Fizi in January 2011, for rape and sexual assault charges, whereas in the past, military officials were granted impunity from such accusations. The UNHRC will work with the DRC government in further implementation and surveillance of these issues as a means of eradicating the pervasive sexual violence that continues today.

Human Trafficking and Sexual Slavery

The DRC is considered a source and destination for human sex trafficking, a majority of which is conducted by various militia groups that occupy regions of the DRC. While many of the individuals forced or abducted into trafficking remain in the DRC, particularly the eastern region of the country where governmental control lacks, armed militia groups routinely sell women and children into forced labor and sexual slavery to neighboring African countries. Current laws outlaw all forms of human trafficking.

Though the Child Protection Code of January 2009 criminalizes and penalizes sexual trafficking and exploitation of children, as well as outlaws the recruiting of children into armed forces such as militia groups, enforcement of the code is not pervasive. The United Nations deemed the DRC out of compliance with the minimum requirements to mitigate trafficking, stating that the DRC government has not made significant efforts to eliminate trafficking nor has it implemented law enforcement efforts to address the ongoing injustices (CIA 2014).

The DRC remains a country in repair today. With a long history of colonial control followed by political unrest and militia violence, the DRC has obstacles to face in reconstructing the country to a place where it can attend to the needs of all its citizens. As women in the DRC begin to find spaces where they can exercise their voice and advocate for better conditions for women and girls in the DRC, the communities and opportunities women in the DRC create for each other serve as places of growth and hope.

E

Egypt

Overview of the Country

Egypt geographically lies in two continents: while most of the country lies in the northeastern tip of the African continent, the Sinai Peninsula lies in Asia. Egypt has been defined by its geographic landscape since time immemorial. Two deserts border the Nile River, around which the ancient Egyptian civilization has flourished since 7000 BCE. It is further defined, and protected, by cataracts at its southern border that impede navigation of the Nile and by the Mediterranean Sea to the north.

Within these naturally defined borders, Egypt has been a state for approximately the last 4,000 years. The French expedition to Egypt (1798–1801), led by Napoleon Bonaparte, is usually cited as the start of the modern Egyptian state. In 1805, Muhammad Ali assumed power in Egypt and created a modern state; his successors ruled Egypt semi-independently within the Ottoman Empire. Egypt was colonized by the British in 1881 and gained nominal independence in 1922, following a revolution in 1919. A coup d'état in 1952 deposed King Farouk I and established a republic, and Egypt successfully negotiated full independence from the British in 1954. Egypt was then declared a republic, and a new constitution was drafted in 1956, in which women acquired suffrage and political rights.

Since its independence from Great Britain, presidents with military backgrounds have ruled Egypt for 60 years. Gamal Abdel Nasser officially became the first Egyptian president in 1956 and ruled until he passed away in 1970. His then vice president, Anwar al Sadat, succeeded him. Sadat ruled Egypt until his assassination in 1981. He was succeeded by his vice president, Hosni Mubarak. Mubarak ruled Egypt from 1981 until 2011, when a popular uprising—inspired by the Tunisian 2010 revolution—removed him from power. The Supreme Council of Armed Forces (SCAF) assumed power until June 2012, when presidential elections were held and Mohammed Morsi of the Muslim Brotherhood assumed power. Morsi was ousted in July 2013 by the military, which had intervened to remove him after another popular uprising against him. A new constitution was drafted, in which women were explicitly granted equal rights. An interim government led by the head of the Supreme Constitutional Court, Adly Mansour, led the country for a year (July 2013 to June 2014). In the presidential elections held in May 2014, Field Marshal Abdel-Fattah al-Sisi won with 96.6 percent of the vote. He was inaugurated June 8, 2014.

Egypt is not ethnically diverse, with 99.6 percent Egyptians and only 0.4 percent other ethnicities. Most of the population is Sunni Muslim (around 90%), 9 percent are Coptic Christians, and 1 percent of the population follows other religions.

Egypt's population growth is on the rise; birth rates soared to 23.35 per 1,000 people in 2014, while the death rate is 4.77 per 1,000 people. Egypt's population has thus increased rapidly, and in July 2013, the Egyptian population was estimated at 86,895,099 (CIA 2017). Figures for 2014 show life expectancy for women at 76 years and 2 months, and for men at 70 years and 8 months. The maternal mortality rate is 66 per 100,000 births, which is five to eight times higher than in developed countries, and infant mortality in 2010 was 22.4 per 1,000 births, again, five to eight times higher than in developed countries.

In 2014, the UN Development Programme (UNDP) ranked Egypt 110th out of 187 nations based on the Gender Inequality Index (GII, 0.855). Gender issues include education, law, violence against women, and others.

Overview of Women's Lives

Egyptian women have gained access to public education since the late 19th century, and the first group of women was admitted to the Egyptian University (now Cairo University) in the late 1920s. This has led to the visibility of Egyptian women in the public sphere throughout the 20th century, and they have increasingly gained access to professions that had primarily been confined to males.

Yet, disparities persist within education: 81.7 percent of males compared to 65.8 percent of females are estimated to be literate (CIA 2017). Gender disparities persist in the realm of personal law as well, and the society remains highly patriarchal. For example, until 2004, a woman could not give her nationality to her children in a mixed marriage, but a man could. In addition, honor crimes, violence against women, and other inequalities remain widely protected by the legal system. Divorce, to take another example, remained a man's prerogative until 2000, when Mubarak issued a "no-fault" divorce (*khul*) law, which gives women the right to file for a divorce on any grounds, as long as she renounces financial rights. This is a positive step toward changes in Personal Status Law in Egypt, which is based on Islamic penal code, also known as sharia law.

A vibrant feminist movement has been going on in Egypt since the early 20th century. Huda Sha'rawi cast off the face veil in 1923, and she was followed by many educated middle-class women. Egyptian women formed the Egyptian Women's Union, which was active in promoting education for girls and suffragist rights for women. In 1956, Egyptian feminist Doria Shafik went on a hunger strike, along with a number of her colleagues, to secure

political rights for Egyptian women. Her move attracted media attention around the globe, and the regime had no choice but to assent. Suffragist rights were instituted for Egyptian women, but Shafik was subsequently put under house arrest until her death in 1974.

Another prominent Egyptian feminist, novelist, and physician is Nawal Saadawi. Saadawi has been vocal over the last 40 years in promoting women's rights in Egypt. She is probably the most controversial figure in the Egyptian feminist movement and a vocal activist against female genital mutilation (FGM), also known as female genital cutting (FGC), which is widely practiced in Egypt. The third generation of Egyptian feminists is now carving out new ways to deal with the challenges of patriarchal society in the early 21st century. They are taking on such themes as violence against women and challenging the societal taboos that blame victims and silence them.

Children

The Convention on the Rights of Children went into force in 1990 after the majority of UN member states ratified it. Egypt was one of the first 20 countries to ratify it. The convention recognizes children under the age of 18 as human beings with distinct rights, rather than recipients of charity and support. Countries that have ratified the convention are bound by it, and they are required to report on the advancement of children's rights within their countries.

Despite its ratification of the convention, Egypt still lags behind in children's rights. Egyptian children enjoy their most basic right: the right to survival. Due to advancements in and the spread of medical care, there has been a 50 percent reduction in the number of children who die before the age of five. Health services have also helped spread the immunization of children, which the government provides for nominal fees; today, 97 percent of the children are immunized, yet children still contract measles and polio. Egyptian children are also prone to malnutrition, which affects their energy in school. A study by UNICEF shows that "1.6 million children under 5 years suffer health and food deprivation." Additionally, the poorest of Egyptian children—around 5 million—live in inappropriate housing, without proper shelter, water, or sanitation (UNICEF 2017). This is a reason for concern because children are the future of the nation. If we deprive them of their childhoods, we are essentially depriving the country of its future.

Women's Voices

Nawal El Saadawi

Nawal El Saadawi, an Egyptian feminist, writer, and medical doctor, has spent her career as an advocate for women. The 1969 publication of her book *Women and Sex* led to the loss of her job in the Ministry of Health. In 1981, the Egyptian government imprisoned her when she criticized the state. While in prison, she wrote *Memoirs from the Women's Prison* (1984) on toilet paper with an eyebrow pencil. Under threat from religious fundamentalists, she left Egypt to teach in U.S. universities but returned in 1996 to continue her activism. In 2010, she told *The Guardian*, "For me feminism includes everything. . . . It is social justice, political justice, sexual justice. . . . It is the link between medicine, literature, politics, economics, psychology and history. Feminism is all that. You cannot understand the oppression of women without this" (Khaleeli 2010).

Khaleeli, Homa. 2010. "Nawal El Saadawi: Egypt's Radical Feminist." *The Guardian*, April 15. Retrieved from <http://www.theguardian.com/lifeandstyle/2010/apr/15/nawal-el-saadawi-egyptian-feminist>.

Education

Of the estimated 90 million Egyptians, about 29 percent are adolescents (UNICEF 2017), and 62 percent are under the age of 29 (UNFPA 2017). Egyptian law requires girls and boys aged 6–14 years old to attend school. Even though attendance at primary and middle schools is compulsory, only 90 percent of those children who are supposed to attend school actually do. The government provides free public education for children in schools throughout the country. In the 1990s, an estimated 11,000 new schools were built to accommodate the increased number of students and to serve students in remote areas (UNICEF 2017).

It is estimated that there is a gender discrepancy in school attendance, as 4 percent of boys never attend school, compared to 13 percent of girls, and these percentages are higher in the South than in the North. In addition, an increasing number of students never complete their compulsory education (primary and middle schools). Those who drop out usually join the workforce to support their

families, despite Egyptian laws that prohibit child labor under the age of 15 years, especially if it prevents students from attending school. Laws also prohibit the abuse and exploitation of children in the paid labor market. Since about 2000, the government has added laws against the trafficking of children for sexual, economic, and commercial exploitation (UNICEF 2017). Nevertheless, child labor remains one of the concerns in a country where children are traditionally considered assets for the families, especially families who have lost their male breadwinner.

Students learn through the "banking" system of education, so-called because it is structured for teachers to deposit information into the students, and that information is supposed to remain available for withdrawal through exams that assess knowledge acquisition. Egyptian students are required to repeat what the teachers say, and there are indications that corporal punishment is prevalent in public schools. It has been the state policy, however, over the last few decades, to prohibit corporal punishment in schools. The banking education system does not prepare Egyptian adolescents for life. They are unaware of risks related to sexual activity (including sexually transmitted infections), smoking, nutrition-related diseases, and other concerns.

Many Egyptian smokers are under the age of 15, around 500,000. According to a survey by the World Health Organization published in 2012, about 3.8 percent of girls between the ages of 13 and 15 consume some form of tobacco, whether cigarettes or a traditional water pipe (shisha) (El Awa et al. 2013; WHO 2015). In addition, secret ('urfi) marriages are common among youth, especially university students. This, coupled with the lack of health education, makes Egyptian girls prone to sexually transmitted diseases. The lack of health education springs from the cultural norms that dictate propriety and prohibit premarital sex.

The Egyptian government provides free high school education for youth. Public universities exist in all the major cities and are fully funded by the government. Students are required to pay only nominal fees for their education and to purchase books and supplies. The Egyptian capital, Cairo, is home to three public universities—Cairo University, Al-Azhar University, and Helwan University—in addition to a number of private universities where students are required to pay tuition and fees. Cairo University, the biggest and oldest university in the country, has an enrollment that exceeds 250,000 students. It provides education majors ranging from medicine and engineering to

fine arts and literature. The student populations are evenly divided among the sexes.

Socialization into Gender Roles

Egyptian laws prohibit the employment of children under 15 years of age, especially if it prevents children from attending school. Yet, from a cultural perspective, adolescence is the age that marks gendered participation in the public space. Young girls are generally encouraged to stay at home and refrain from unnecessary appearances in the public space upon reaching puberty. On the other hand, upon reaching puberty, young Egyptian men are generally encouraged to participate in the public space and train for their future roles as providers for the family. Household chores are thus partially delegated to adolescent girls, while chores that require appearances in the public space are delegated to adolescent boys.

This early training imprints on young men and women their future roles and societal expectations of their participation along clearly set gender-based lines. This ultimately results in a general support for the traditional division of roles among gender, as the study by Mensch et al. (2003) indicates. The study also suggests that girls are less conservative regarding these roles. Young women in Egypt are aspiring for more equitable gender relations, especially within marriage, while young Egyptian men are holding to their traditional prerogatives. This partially explains the high divorce rates prevalent in Egypt today.

Health

Access to Health Care

Health in postrevolutionary Egypt has not been a priority of the government, even though the constitution guarantees citizens the right to health. The urban-rural and rich-poor divides in Egypt make for stark differences in access to health care. Five percent of the gross domestic product (GDP) is spent on health care, which is similar to other countries with similar markets but low compared to the West. Few clinics and hospitals can be found outside major cities; 20 percent of rural hospitals do not have a doctor, and a scant 40 percent of necessary medical supplies are available in government hospitals and clinics (Devi 2013). The situation is dire, leading doctors and pharmacists to hold vigils and strike for more facilities and health care professionals. There are only 8 physicians and 4 nurses and midwives for every 1,000 people in the

country. Out-of-pocket expenditures are as high at 72 percent for health care. Improved water access and sanitation has contributed to some better health outcomes in recent decades.

Maternal Health

Birth rates had been steadily decreasing until the revolution, after which a surge in the birth rate has been recorded (a 17% increase from 2008 to 2014 according to USAID in 2016). The current government advocates for doubling the population. The government did not educate the opposition about family planning, reproductive health, and gender issues prior to the revolution, and now that this opposition is in power, this lack of basic knowledge is contributing to worsening conditions for women's health. In fact, the Muslim Brotherhood has resisted the UN declaration combating violence against women because it is viewed as "advocating sexual freedoms for women and the right to abortion" (Devi 2013).

A study conducted by the Department of Health Services (DHS) found that more women (77%) than men (66%) knew at least 1 of 9 methods of family planning, and when other methods of family planning, such as IUDs, the pill, and injectables, were named, 9 out of 10 women recognized more than 3 (DHS 2015).

Maternal mortality rates are high and connected to a lack of understanding and nonuse of family planning, poor or a lack of antenatal care, and the lack of skilled birth attendants. Egypt is 1 of 10 low- and middle-income nations with high mortality rates (WHO 2015). Overall, 80 percent of births are attended by a skilled birth attendant, but when one compares urban to rural numbers, a starker image emerges. In poor rural areas, these numbers are only 60 percent compared to greater than 90 percent in wealthy urban areas (WHO 2015). Up to one-third of maternal deaths are the results of a lack of antenatal care. Cesarean-section rates are high; 4 out of 10 births are surgical and only 1 out of 6 C-sections are decided upon after labor begins, meaning that most are planned surgeries (DHS 2015).

The reduction in deaths for children under the age of five is the result of health interventions, increased immunization coverage, appropriate care for sick children, and improving socioeconomic conditions. Exclusive breastfeeding until an infant is six months old is at 53 percent, and 96 percent of children have been immunized for DTP3 (WHO 2015). Adolescent fertility rates are high, and the

marriage age for girls is lower than for boys. There is also a wide age gap between husbands and wives.

Diseases and Disorders

Only 2 percent of women have had a clinical breast cancer screening, and only 7 percent of women have heard of Pap smears to screen for cervical cancer, with only 0.3 percent actually having had one (DHS 2015). Common chronic diseases in Egypt include hypertension, obesity, cardiovascular disease, and diabetes.

Egypt has the highest rates of hepatitis C in the world; 20 percent of the country's inhabitants are infected (Devi 2013). This is explained, in part, by inadequately sterilized needles used from the 1960s through the 1980s during a massive campaign to treat schistosomiasis, a parasitic disease carried by freshwater snails. Nine out of ten Egyptians are aware of hepatitis C, but only half of women know about hepatitis B. Slightly more men than women have knowledge of how hepatitis is transmitted.

HIV rates have increased, based on biobehavioral surveys. And according to UNICEF, Egypt is facing an epidemic for intravenous drug users and homosexual men, but testing is not common in other population groups, so the actual numbers are unknown. More than 1,700 of the 7,196 people living with HIV are women, but only 19 percent are receiving antiretroviral treatment (UNICEF 2015). There are no estimates for female sex workers, and challenges surround prevention services with key populations because their behaviors are criminal. Approximately 6 percent of women and 10 percent of men have complete knowledge of HIV that includes effectiveness of condom use and limiting sex to one uninfected person to prevent infection (DHS 2015). Misinformation is common, and many Egyptians erroneously believe that HIV is transmitted by mosquitos or by sharing food.

Female Genital Cutting (FGC)

Female genital cutting (FGC), which is sometimes called female genital mutilation (FGM), is deeply rooted in the cultural practice of Egypt and dates back to time immemorial. Mummies of Egyptian princesses who underwent the surgery have been discovered in archeological sites. A midwife usually administers the procedure on girls at the age of 9 to 14, traditionally. Nowadays, physicians do the procedure in clinics. "According to the national 2014 Demographic and Health Survey, 92 percent of Egyptian

married women between the ages of 15 and 49 have undergone FGM, 72 percent of them by doctors" (UNFPA 2017; DHS 2015). There are three kinds of FGC, according to the severity of the cut, and all are practiced in Egypt. It is estimated that more than 90 percent of married Egyptian women (between ages of 15 to 49) have been subjected to FGC. "In 1995, the first Egyptian Demographic Health Survey (DHS) that included data on FGC revealed that 97 percent of women between the age of 15 and 40 had undergone some form of genital cutting" (Van Raemdonck 2013). This figure is of concern for Egyptian feminists and activists, who rally against the procedure.

Renowned Egyptian feminist Nawal Saadawi (1930–) has been particularly vocal against FGC. A physician by training, Saadawi campaigned against the practice as early as the 1970s. She pointed to the complications associated with the practice that can result in death. In addition, she campaigned against the diminished sexual pleasure for women who undergo the procedure. She also warned against the health complications that a woman with FGC is at risk for when she is giving birth, especially when she has undergone the procedure in its severest form.

The International Conference on Population and Development, held in Cairo in 1993, resulted in the Cairo Program of Action, which noted FGC as a concern for reproductive and sexual rights. The debate that ensued ranged from conservative views that defended the practice on cultural and religious grounds, to reproductive rights activists who sought to abolish it. Egyptian activists continued to work on the ground until the decision makers recognized their efforts. "The Egyptian government started to develop highly mediatized national campaigns [against FGM] in 2000, after five years of activism from 1994 until 1999 by the National Task Force against FGM" (Van Raemdonck 2013). In 2008, the government outlawed the practice, but it is still very widely spread.

The issue is a cultural rather than a religious one. The issue has historical roots that predate Islam. According to Vivian Foad, an official at the National Population Council, "Both Muslims and Christians do it," because of its assumed role in protecting a woman's chastity, which is pivotal within the traditional society (Kingsley and Abdo 2015). The official ban on the operation, along with increased awareness of the contingent issues, has led to a decreased support of FGC. Recently, a father and a doctor have been charged in court with carrying out an FGC operation. Sohair al-Bata'a, 13 years old, died in 2013 of complications due to an FGC operation performed by a physician

in a clinic. The doctor was sentenced to two years in prison, while the father's sentence of three months for subjecting his daughter to FGC was suspended. Human rights activists are hopeful that such prosecutions will serve as a deterrent against FGC operations.

Employment

According to an Egyptian saying, women comprise “half the society,” and this is demographically accurate, as the Egyptian population is roughly 50 percent female. However, Egyptian women comprise about 25 percent of the workforce; a gender gap also persists in wages and in leadership positions. Egyptian women are six times less likely to be someone's boss, according to *The Economist* online (2011). In addition, Egyptian women are more likely to suffer unemployment than men, despite their increasing numbers in higher education. According to the World Bank, the figures show that “between 1998 and 2006, the percentage of young Egyptian women possessing a university degree rose from 6 percent to 12 percent. Strikingly, the female labor force participation rate in this age group remained near-stagnant, while their rate of unemployment increased from 19 to 27 percent” (Yamouri 2010).

Unemployment percentages vary between urban and rural settings and according to proximity to metropolitan settings. For example, unemployment in Cairo stood at 8.7 percent for men and 15.4 percent for women in 2008, according to the Hisham Mubarak Human Rights law firm. Yet, in the outermost governorate of Aswan, unemployment stood at 10.7 percent for men and 44.4 percent for women (Aidarous and Ragheb 2010). This unemployment rate for women, almost four times that of men, exemplifies the overall underdevelopment in remote areas.

The public sector (the government) is the biggest employer in the country, with some 2.5 million employees. Of these, 72.7 percent are male, and 27.3 percent are female. But a close look at the subdivision of employees in different sectors gives a fuller picture of employment's gender bias in Egypt. Women are distributed in what are traditionally regarded as “women's jobs,” such as health care (70.4%) or social security and welfare (43.4%). On the other hand, in what are commonly regarded as “men's jobs,” women's employment is low—army, police, and justice (no women) and construction (9.6%) (Aidarous and Ragheb 2010). The figures may have increased over the last five

Women's Voices

Azza Soliman

Azza Soliman is a lawyer and activist from Egypt who works to create a new discourse about religion while focusing on women's rights. She works with religious groups to help change “how *fatwas* (religious edicts) are made and produced” (Ashoka 2016). Soliman graduated from Cairo University, and she holds degrees in human rights and civil society. She cofounded the Center for Egyptian Women's Legal Assistance (CEWLA), located in Cairo, and she also serves on the Board of Trustees for CEWLA. CEWLA's mission is to advance women's human rights through law. On October 24, 2015, Soliman was acquitted of charges of unlawful protesting and breach of security and public order after providing testimony of police brutality (FIDH 2016).

years, but disparities persist. Perceptions of gender roles that confine women to “caregiving” as an extension of their domestic roles are prevalent within the Egyptian context.

Cultural factors may tie women to traditional roles and impede their full participation in the workforce. Yet, in economic analysis, women are thought of as powerful drivers of economic growth. It is estimated that “the Egyptian economy would grow by 34 percent” if women participated in the labor force on levels similar to men (Aguirre et al. 2012). This is why analysis of the current situation and the devising of new strategies to empower women are crucial.

Family Life

Family is the basic unit of Egyptian society, as stated in their constitution. To this end, state laws work to preserve the Egyptian family, for example, maternity laws that grant

mothers the time to care for their babies. Family units in Egypt receded from traditional extended families to more nuclear families over the course of the 20th century. Yet, the structure is deeply patriarchal, where the elder male holds power over other members in the family, including young males. In such a structure, a male's birth is a privilege celebrated by the parents, grandparents, and the whole family. The birth of a male child marks the extension of the family name, the assurance of inheritance within the family (a surviving male child wards off external inheritance and confines inheritance to the nuclear family), and support for the parents in old age.

As indicated above, traditional gender roles persist in modern-day Egypt. A young son and a young daughter entering their adolescent years are trained along gender role lines. A son is expected to be present in the public space and trains to provide for his family members and to protect them. A daughter is expected to be present in the private sphere and trains to care for family members. These roles are then carried on into marriage.

Gender roles, however, have been slowly shifting in Egyptian families with the entrance of women into the job market. A wife's salary has become essential for the livelihood of the family, and this has brought about some changes. Gender roles still adhere to traditional paradigms, but Egyptian women are slowly amassing more power through their continuous education and employment. It is thus inaccurate to assume that gender roles have been static in Egypt since the beginning of the 20th century. As mentioned in a previous section, research indicates that young adolescent girls are more inclined toward equitable gender relations than adolescent boys.

Another indication of the phenomenon of shifting gender relations is the rate of divorce in Egypt, which stands at a high 40 percent. The fact that Egyptian women more readily accept separation reflects their economic independence and their reluctance or unwillingness to accept inequitable gender relations within their marriages. According to the World Bank, female-headed households were 13.4 percent in 2008, a figure that is increasing steadily as divorce rates increase in Egypt (divorce increased by 4% from 2012 to 2013) (Yamouri 2010).

Maternity Laws

Motherhood is highly revered in Islamic tradition and in Egyptian culture. The prophetic saying, "Heaven lies underneath the feet of mothers," is commonly taught in schools,

circulated in the media, and is widely quoted. Such reverence is translated into Egyptian labor laws, which grant the mother of a newborn three months of fully paid leave. Upon her return, the mother is granted a fully paid hour daily for breastfeeding until the baby turns two. Breastfeeding for two full years is a prerogative mentioned in the Koran (S:A 1:222). An employee also has the option of taking these two years as an unpaid leave, and the employer is supposed to pay for her insurance.

Labor laws grant the mother the option to have six years of unpaid leave to take care of her children, either consecutively or two years per child for three times during her employment. It is worth noting, though, that while the public sector abides by these labor laws, the private sector is more reluctant to provide such generous leaves for mothers. This leaves a wide segment of Egyptian women who are employed by the private sector unprotected, which generally leads to the interruption (or the forsaking) of their careers.

Inheritance Laws

Egyptian family status laws are derived from the Islamic code, commonly known as sharia. Muslim females are economically supported by their closest male relative; this is a legally binding position. A female can technically sue her closest male relative for failing to support her. Within this paradigm, males and females who do not have equal economic obligations do not have equal economic rights. Generally, inheritance law grants males double the inheritance of females. A wife's inheritance is one-eighth of her husband's assets, while a husband's inheritance from his wife is one-fourth of her assets. There are exceptions for this general rule, for example, in the instance that the deceased had multiple wives (a Muslim man can have up to four wives, on the condition of total justice between them).

Inheritance laws are based on explicit verses in the Koran, especially in sura (chapter) 3, titled "Women." Although some people argue that it is not fair for women to inherit half of what men do, it is rather difficult to change this rule because of its explicitness in the holiest text of Islam, the Koran. In addition, the prerogative comes, as explained above, with the obligation of maintenance for the close female relatives: wives, daughters, mothers, and sisters. Some Egyptian women's rights activists therefore focus on holding men responsible for their obligations rather than devising foreign-sounding arguments about

equal rights that may not suit the context. In addition, Egypt's culture, as in most countries in the Global South, is based on a collective sense of social responsibility, and the social dynamics are not as individualistic as in some countries in the Global North. It is thus important to regard inheritance laws within the overall social context and to attempt to reform them from within, for example, by holding men to their responsibilities.

Politics

It is often assumed that Muslim women have always been secluded and played no role in politics. Professor Fatima Mernissi, a sociologist from Morocco, problematizes this sweeping generalization by writing about some 300 prominent Muslim women, including warriors and heads of state (Mernissi 1997). Notable among these is Shajarat al-Durr, who ruled Egypt and played a vital role in a battle against a Crusade invasion of Egypt in 1249.

In the modern era, Egyptian women have been active in the political arena since the early 20th century. They played a role in the 1919 massive uprising against the British occupation, and a century later, Egyptian women played a pivotal role in the 2011 uprising that toppled Hosni Mubarak. The feminist movement has flourished since the beginning of the 20th century and succeeded in achieving political gains for Egyptian women, including political rights.

Feminist Movement

"The Question of Women," as it was called at the time, was a subject of much debate among the educated elite in Egypt in the early 20th century. Qasim Amin (1863–1908), an Egyptian lawyer who was trained in France, published two books, *Liberation of Women* (1899) and *New Women* (1901), which stirred much controversy. Amin called for the education of women and the control of divorce and polygamy, which he viewed as the roots of ills in the society. His views were radical for many of his contemporaries, who feared the loss of propriety if girls were allowed an education, and they insisted on upholding traditional family values. Yet, educated men who believed that women's education was imperative for any modernization sympathetically received his views. Although the first proponents of feminism in Egypt were men, women took over the cause from the late 19th century. Female writers, educators, activists, and poets at this early stage included Huda

Sha'rawi (activist), Malak Hefni Nassef (author), Nabawiya Musa (educator), and many others.

Huda Sha'rawi (1870–1947) was a pioneer Egyptian feminist activist who is best known for being the first woman to remove her face covering in public. In 1923, she founded with her colleagues the Egyptian Women's Union in the aftermath of the 1919 revolution. Her work centered on raising awareness regarding feminist issues, especially through the feminist French language magazine *L'Égyptienne*, which was the voice of the union. In this magazine, she and her colleagues published articles on women's issues from social and political perspectives. As the head of the Egyptian Women's Union, Sha'rawi represented Egypt in many international women's conventions and conferences. She also held until her death the post of vice president of the Arab Women's Union.

Malak Hifni Nasif (1886–1918) was an Egyptian feminist who used the pseudonym Bahithat al-Badiya (Seeker in the Desert). The use of pseudonyms was widespread until recently, wherever Arab women found the need to conceal their identities. Nasif published a book titled *Nisa'iyat* (*Women's Things*) in 1910, gave public lectures to female audiences, and published a lot of articles in women's journals. Her works concentrated on contemporary social and political issues from women's perspectives. Mayy Ziyada (1886–1941), an Arab feminist and poet based in Egypt, wrote a biography of Nasif in 1920, including "an analysis of her character in its cultural and social context" (Ashour and Ghazoul 2008).

Nabawiya Musa (1886–1951) is best remembered as an educator, but she was also a writer and a poet. Musa rose to prominence when she became the first female Egyptian school principal. She wrote in various women's journals of her time and established her own in 1937. She resisted the British colonial authority and wrote about it. Her approach to education was integrated in all aspects of her life as seen in this quote:

Nabawiya Musa used stories from her life, her battles with the English education inspectors who looked down on Egyptian teachers, and her stand-offs with ministry officials and foreign principals, turning them into gripping story material and often using them to explain her ideas on the importance of liberating education from colonial control, improving the status of teachers and preserving their dignity, developing curricula to suit Egyptian students, and unifying curricula for boys and girls. (Ashour and Ghazoul 2008)

Musa understood that ‘the personal is the political,’ and her autobiography, *My History by My Pen*, shows that, as it is a more public than private account of her life.

Education fed on feminism and fueled it. The vibrant feminist movement of the first half of the 20th century resulted in an increase in the number of female students enrolled in education and a surge in feminist publications, which in turn led to more education for girls. In the late 1920s, the first female student entered the university, and many Egyptian girls pursued higher education abroad. According to Reid, “the proportion of females in higher education enrollments crept up slowly, from 0.4 percent in 1930 to 7 percent in 1950. It reached 17 percent in 1960, 26 percent in 1969, and 33 percent by 1983” (Reid 2002). Today, the ratio of students in higher education is estimated to be evenly divided between male and female.

This movement was co-opted by the state during the reign of Nasser (1956–1970), a phenomenon that Mervat Hatem labeled “state feminism.” Doria Shafik, who, as mentioned above, was pivotal in constituting the political rights of Egyptian women, was placed under house arrest, while other feminists were allowed to operate within the limits set by the state. Still, the spread of education in the 1960s, a state policy during Nasser’s era, led to an increase in female graduates, and by the late 20th century, Egyptian feminism was back on a track away from the state’s grip. Nawal al-Saadawi was prominent among the leaders of this era.

Today, there are a number of feminist organizations that work in various fields. Nazra for Feminist Studies works on issues of violence against women, providing women with support (Nazra for Feminist Studies 2017). It also produced the first feminist comic magazine ever published in the Arab world. Another well-established nongovernmental organization (NGO) is the Women and Memory Forum, established in 1995, which is an academic research organization that balances negative stereotypes by bringing to the forefront examples of prominent women (Women and Memory Forum 2017). The Egyptian Center for Women’s Rights was established in 1996 and is committed to improving the political and legal status of Egyptian women (Egyptian Center for Women’s Rights 2017). The Association for the Development and Enhancement of Women, established in 1987, works on economically empowering Egyptian women, especially heads of families, by providing microloan programs and other services. These organizations work with a host of other Arab

and international organizations to enhance the plight of Egyptian women. Organizations such as Karama work on strengthening leadership qualities of Arab women and ending violence against them.

In official political representation, especially in the parliament, Egyptian women still lag behind some countries in the Global South. The parliamentary elections of November 2010 brought about the highest number of women in the parliament, about 13 percent, but the parliament lacked legitimacy in the eyes of the Egyptian people, who revolted against Mubarak’s rule only a few months later (Tadros 2014). And because of Egyptian women’s increased political activism since the January 2011 revolution, this has not translated into representation in the parliament. The November 2011 election brought only nine women to the parliament, five from the Islamic bloc. In addition, two Coptic (Christian) women were appointed to the parliament. There is work to be done for Egyptian women on the political front, which is traditionally viewed as a male domain, to ensure a fairer representation in parliament and other political spheres.

Women and the Egyptian Constitution

The Egyptian Constitution was rewritten three times over the last three years. Egyptian feminist organizations mobilized to have a fair representation in the constitutional writing committees. One major initiative by a feminist organization, Women and Memory, initiated a workshop for rewriting the constitution: they read previous Egyptian constitutions, along with constitutions from various countries across the globe. The workshop suggested new articles for the constitution and insisted on old ones that allow women political participation, work, education, personal freedom, and health insurance. In addition, they intervened linguistically by adding the feminine form to the word *citizen* to tone down the sexist nature of Arabic language used in writing the constitution.

The draft was sent to law professors to review it, and they then conducted a seminar to discuss the suggested changes. They finally rallied the feminist organizations, which declared their support for the draft. The Coalition of Egyptian Feminist Organizations united around the document. The suggested amendments were addressed in a letter to the Constitutional Committee and included “critical readings of five gender-related constitutional articles, suggested alternative phrasings, and listed general demands” (Kamal 2015).

Another coalition, Bahiyya Ya Masr, published a list of 150 prominent Egyptian women who could sit in on the constitutional writing committee. As interesting as these initiatives are, they did not lead to active female involvement in the constitutional writing process because the entire political situation that gave rise to such initiatives has subsided as part of the power struggle between major political forces in Egypt: the armed forces and the Muslim Brotherhood. Both ideologies, and especially militarism, prefer patriarchal formations of society.

The new Egyptian Constitution of 2014 grants some additional rights for women. It institutionalizes for the first time the right of Egyptian women to pass on their citizenship to their children in a mixed marriage. It also instills the duty of the state to protect women from violence. In addition, it reiterates women's rights and equality to hold public office and the protection of motherhood. Yet, women have lost their quota representation of 64 seats in the lower parliament chamber that the previous constitution had stated. The new constitution only states "fair or just" representation. This vague statement is a subject of criticism by women's rights activists who fear an underrepresentation of Egyptian women in the upcoming parliament. Yet, generally speaking, the 2014 constitution is thought to be "a most progressive constitution as far as rights are concerned" (Megahed 2014). Understandably, though, commentators and activists are always advocating for more rights for Egyptian women.

Violence against Women

Violence against women has reached an epidemic level, according to a study conducted by UN Women in July 2014. In this survey, 99.3 percent of the respondents admitted being victims of harassment, which includes catcalling, stalking, unwanted touch, rape, and other forms of sexual harassment and obscenity. Harassment occurs in public places, such as public transportation, public gardens, malls, markets, and on the street. Almost half of the respondents (49.2%) indicated that harassment is a daily occurrence, while 26.5 percent put it as a weekly or monthly occurrence. Harassment is not confined to any particular time of the day according to most respondents of the survey. In addition, conservative attire did not deter harassers, as 75 percent of the respondent said that they wore conservative clothes and were without makeup when the incidents occurred.

Although these incidents happen in public places, bystanders do not interfere to stop the incidents and

generally pretend they do not see anything; 75 percent of the respondents gathered that bystanders just do not care. In seeking police intervention, almost 50 percent of the victims said that the police stopped the harasser, while 21 percent said they arrested the offender. The study concludes that 82.6 percent of the respondents feel unsafe on the street (UN Women 2014).

The lack of official security following the January 25, 2011, revolution has exasperated the unsafe situation on the streets for Egyptian women and girls. The police forces, which were overwhelmed by protestors on January 27, 2011, took a few years to regain their strength. The security void meant that all kinds of crimes went unpunished, which led to even more crimes, and harassment was no exception. Harassment after the revolution has increased according to 48.9 percent of the respondents (UN Women 2014).

In addition, the political resistance during the early years that followed the revolution often faced excessive use of force by the state. In one incident in December 2012, the military police confronting the protestors stripped half naked an abaya-wearing protestor (commonly known in the media as "Blue Bra"). A journalist captured the incident, where three policemen handled a protestor, with one of them stomping on her bare stomach. Police forces were often accused of using thugs to sexually assault and rape female protestors in an attempt to deter them from participating in rallies and demonstrations. Not only were the police complicit in such state-sanctioned violence, but also other governmental bodies, including the Egyptian Medical Forensics Authority, which was complicit in tampering with evidence (Fahmy 2015). Such state-sanctioned violence brought even more resistance from activists.

Cultural Response to Sexual Harassment

The 2011 revolution brought about a vibrant political and cultural milieu. Mostafa (2015) refers to this "cultural archive" and enumerates cultural artifacts, including films, graffiti, and photography. In this section, we will see those feminist cultural initiatives related to combating and resisting sexual harassment in Egypt after the revolution.

Graffiti

Images of the individual ruler were replaced by those of ordinary people following the revolutions of the Arab

Spring. Graffiti artists created this visual change in the vistas of different Arab capitals. They brought the dull and shabby buildings of Cairo to life during the early years following the revolution. Various collectives worked tirelessly to spread messages of resistance and defiance to the ruling authorities, especially SCAF (2011–2012) and Morsi (2012–2013). Among those were two collectives, NooNeswa and the Mona Lisa Brigades, which brought “Female Graffiti” (“Graffiti Harimi”) to the limelight.

Their works concentrated on challenging the patriarchal order by drawing feminist themes. Iconic female figures were drawn to remind the viewers of the achievements of Egyptian women. In addition, artists from both collectives drew images that signified resistance to police brutality, such as the case of Blue Bra. Blue Bra became a recurrent image in various graffiti that signified resistance to state brutality.

BuSSy

BuSSy is an amateur theatrical company that concerns itself with women’s issues. BuSSy (which means “look” when said to a female in the imperative) is conceptually based on the activist play *Vagina Monologues* by Eve Ensler. It solicits real-life stories dealing with a particular topic and recreates them in monologue format, which amateurs act out in live performances. It started in 2006 as a performance at the American University in Cairo (AUC) and has since grown immensely. Since 2010, BuSSy has grown outside of AUC and has performed in various venues around Egypt, including the Cairo Underground (Metro). The main objective is to raise awareness among people regarding issues that they know little about.

BuSSy collaborates with various initiatives and organizations to produce their monologues, which are aimed at empowering women; the themes include harassment, domestic violence, and teen issues. The performances are sometimes deemed inappropriate, as the language used is explicit, so a state-sponsored theatrical venue attempted to censor the show. They canceled it when the censorship attempts were rejected by BuSSy. The director, Sondos Shabeykh, told Laura Dean of the *Global Post* that they submitted a self-censored script of their show to the censorship authorities, who censored it anyway! Ironically, the censored text alludes to more than what was initially intended by the authors. Shabeykh commented, “You feel like in the censored version the audience would think the actors were referring to something much more shameful

than they actually were” (Dean 2015). Yet, BuSSy persisted and sought to perform in other venues.

Cartoon

Political cartoon art has been a male domain in Egypt since the late 19th century. Ya’qub Sannu’ (1838–1912), who was a cartoonist, journalist, and theatrical actor, is usually credited as the first cartoonist in Egypt to criticize colonial influence (Fahmy 2011). A number of male cartoon artists dominated the scene in the second half of the 20th century.

The male monopoly over political cartooning in Egypt has been breached over the last few years, as a number of female cartoon artists have taken to the medium. Cartoonists such as Doaa El-Adl, Muna Abdurrahman, Yasmin Mamoun, and Dalia Mukhtar, among others, are actively drawing about women’s issues. Their works are published in mainstream newspapers and magazines, and they also hold exhibitions to display their work. Their works have brought them a lot of recognition in the field. Doaa El-Adl, for example, is a recipient of multiple awards, both nationally and internationally.

A group among this generation formed the Association of Egyptian Female Cartoon Artists, which held a number of exhibitions to pointedly discuss women’s issues. Their exhibition held on June 26, 2014, was dedicated to discussing sexual harassment. Their themes insist that a female victim of sexual harassment does not have a particular profile: she may be young or old, she may be very modestly dressed or not, and she may be in her own neighborhood or in the office space. Collectively and individually, young female cartoon artists are breaking societal taboos around discussing its ills and are changing the victim-blaming mentality regarding sexual harassment.

El Shakmagia is the latest publication in the flourishing comic scene in Egypt. It is also the newest initiative by Nazra for Feminist Studies, an organization that has been active in combating violence against women over the last few years. *El Shakmagia* (which means “a vintage jewelry box”) was first published in October 2014. It is the first feminist comic magazine in the Arab world. The first issue is dedicated to the theme of violence against women and has some 12 stories and a handful of articles and cartoons. The stories illustrated in the first issue deal with various problems: harassment in the workplace, domestic violence, and child abuse, among others. In one

story, women have undergone genetic modification (they have grown extra arms and eyes) to ward off unwanted physical contact in the public space. One cartoon illustrates a young girl seated on the lap of her middle-aged manager, who is asking her how she likes her new chair. The editorial by editor in chief Fatima Mansour points to rampant harassment and efforts by Nazra and other organizations to eliminate violence against women in the public space.

Eritrea

Overview of Country

As an independent state, Eritrea is a relatively new country in Eastern Africa. Similar to many other African nations, the history of Eritrea is intricately associated with colonialism. Eritrea gained independence from Italy in 1941, after being an Italian colony since 1890, but it remained under British administrative control until 1952, when the United Nations declared it an autonomous region within Ethiopia. In 1962, a violent 30-year war with Ethiopia erupted that finally ended in 1991, when Eritrean rebels captured the Eritrean capital of Asmara and defeated the Ethiopian government forces. At this time, the Eritrean Popular Liberation Front (EPLF) formed a temporary government until Eritrea became an independent nation in 1993. After independence, the EPLF changed its name to the People's Front for Democracy and Justice (PFDJ) and became the only political party in Eritrea. As a one-party state, Isaias Afworki (1946–) (also known as Afwerki, Afewerki, or Afeworki) is the only president that Eritrea has had since independence, and he has been criticized by many of suppressing democracy and being a leader who rules with absolute power and restricts the freedoms of the people of Eritrea (CIA 2014; U.S. Department of State 2014).

Bordering the Red Sea, as well as Djibouti, Sudan, and Ethiopia, Eritrea's nearly 6.4 million inhabitants live on 117,600 square kilometers, which is roughly the size of the U.S. state of Pennsylvania (CIA 2014). Rather than enjoying a peaceful existence as a new nation-state, Eritrea has been plagued with conflicts since its independence. In addition to military conflicts over borders with Djibouti and Yemen regarding the Hanish Islands in the Red Sea, Eritrea also entered into a deadly border conflict with Ethiopia in 1998 that resulted in approximately 70,000 deaths between the two countries before they reached a peace deal in 2000. A security zone now separates the two countries; they are no longer actively fighting, but the border issue remains unresolved. This long history of conflict, along with president Afworki's mandatory national military service program, has hindered economic development, as large numbers of Eritreans are in the army instead of the workforce (CIA 2014; BBC 2014).

As is the case for most low-income countries, the majority of Eritrea's population is young; over 60 percent of the population is under the age of 25 (CIA 2014). With an average life expectancy of only 63.5 years, the life expectancy

of Eritreans is ranked among the bottom quarter of the world. Maternal and infant mortality rates are relatively high. The maternal mortality rate is 240 deaths per 100,000 live births, and the infant mortality rate is over 38 deaths per 1,000 births (CIA 2014). These mortality rates, coupled with high fertility rates of over four births per woman and a low contraceptive prevalence rate of only 8 percent, leave reproductive health issues as a pressing concern for women living in Eritrea (CIA 2014; Population Council 2005).

Eritrea is ethnically diverse, with nine officially recognized ethnic groups. The majority of the population is Tigrinya or Tigre; together make up 85 percent of the population. But Saho, Kunama, Rashaida, Bilen, Afar, Beni Amir, and Nera are also officially recognized (CIA 2014). Although many languages are spoken, Tigrinya, Arabic, and English are the country's three official languages. In the Dahlak Islands, Tigre is the most commonly spoken language. Eritreans are roughly equally divided between Muslims and Christians, but the Christians are further divided into Coptic (or Orthodox) Christian, Roman Catholic, and Protestant denominations.

Girls and Teens

Education

The Eritrean Popular Liberation Front established a Department of Education in 1975 and focused much attention on education during its struggle for liberation, especially among those directly involved in the fighting efforts. However, decades of conflict with Ethiopia left Eritrea with much room for improvement in terms of education, especially for girls. In 1991, at the end of the war with Ethiopia, it was estimated that 84 percent of the existing 190 schools were in serious disrepair (Rena 2005b). Moreover, access and the physical geographic distribution of schools were significantly unequal, with a much higher number of secondary schools and students in the highlands than in the lowland areas of Eritrea (Petros 2000). This unequal distribution of education has real impacts for the lives of girls and lasting effects as they become women and bear children. Women in rural areas and women with less education have higher fertility rates, a younger age at first birth, and lower contraceptive use; these same women have children with lower vaccination rates and higher rates of malnutrition and diarrhea (Population Council 2005).

The educational system in Eritrea today is divided into five levels: early childhood development (ages 5 to 6); primary grades 1 through 5 (ages 7 to 11); middle grades 6

and 7 (ages 12 to 13); secondary grades 8 through 11 (ages 14 to 17); and postsecondary. Education is now compulsory for all Eritrean children aged 7 to 13, yet enforcement is difficult. The actual average number of years that boys attend school is only five years, and for girls it is only four years (Rena 2005b). Literacy rates for those aged 15 and older is 79.5 percent for males, but only 59 percent for females (CIA 2014). According to the United Nations Children's Fund (UNICEF) and the World Bank evaluations and reports on the status of education in Eritrea, and particularly the status of the African Girls Education Initiative, "The current primary education system contains severe inefficiencies. . . . Only about 45 percent of students who enter grade 1 complete primary education" (Chapman, Lexow, and Issayas 2003, 2). Few students at the post-secondary and university levels are female, and even fewer faculty members are women (Bernal 2001).

Furthermore, at age 18, both girls and boys must serve a compulsory military term, many of whom experience a forced extension of service. Young women face sexual abuse and rape while in the service, and many flee the country to escape or marry and give birth early to avoid this military service. The first option places women in great danger of being trafficked (see below), and the second option has long-term effects on women's economic security.

Family Roles

Although it varies by region, traditional family beliefs in Eritrea generally do not value education for girls. This belief comes from concern about contact with boys, the marriageability of an educated female, and the need for help with domestic labor at home, such as the collection and carrying of water and firewood. Moreover, due to the unequal geographical distribution of schools, there is concern from some families about the great distance girls have to travel to get to the closest school. Thus, although UNICEF and Eritrea's own Department of Education have shown concern about the enrollment of girls in school, family beliefs and the role of girls and teens in the family are substantial obstacles that must be overcome before gender equality in education can become a reality.

Health

Access to Health Care

Eritrea spent 3.3 percent of its gross domestic product (GDP) on health care in 2014 (Global Health Workforce

Alliance 2016). Life expectancy is 62 years for men and 67 for women. Forty-three percent of the population is under the age of 15, and the median age is 18 (Global Health Workforce Alliance 2016). In the past seven years, Eritrea has doubled its number of physicians from 3 to 6 per 100,000 people and increased the number of nurses from 20.5 to 75 per 100,000 people (Global Health Workforce Alliance 2016).

No current numbers are available for access to improved water and sanitation facilities.

Maternal Health

Only 8 percent of women in Eritrea use some form of contraception, and the fertility rate in 2013 was 4.7 (UNICEF 2015; Global Health Workforce Alliance 2016). For a woman between 15 and 49, there is a 22 percent chance she will be ill or die from maternal causes. The maternal mortality rate was 380 per 100,000 in 2013. Only 40.9 percent of women attend four or more antenatal appointments, but 70.3 have one antenatal appointment (UNICEF 2015). Only 28.3 percent are attended by a skilled birth assistant for delivery, but this varies greatly by area, with 64.7 percent of urban women compared to 10.4 percent of rural women having a skilled birth attendant at their births (Global Health Workforce Alliance 2016). A mere 6.7 percent of the poorest women in Eritrea compared to 81 percent of the richest women have a skilled birth attendant. The mortality rate for children under 5 years old is 50 per 1,000 children, which is higher than it was in 1990 at 86 per 1,000 (Global Health Workforce Alliance 2016).

Abortion prohibitions follow Ethiopian law. It is prohibited except save the life of the mother or to preserve her physical or mental health. Little information about prevalence is available, but it is suspected that abortion is common. Unsafe abortions are dangerous and can contribute to lasting health issues for women. The country is concerned about unwanted pregnancies and unsafe abortions. This is especially of concern for adolescents. Twenty-nine percent of adolescent girls are married (UNICEF 2015).

Diseases and Disorders

Immunization rates are up. Lower respiratory infection is the leading cause of death (11.5%), followed by diarrheal disease (8%); HIV deaths are 5.3 percent. Acute respiratory infection is the leading cause of death in children under 5 years old (UNICEF 2015).

Hypertension (or high blood pressure) is the most common noncommunicable disease risk (28.1%), followed by diabetes (7.3%). Only 3.2 per 100,000 deaths are attributed to malaria (Global Health Workforce Alliance 2016); 48.9 percent of Eritrean children sleep under insecticide-treated nets (ITNs), and 70.9 percent of households have at least one ITN (UNICEF 2015). HIV deaths are down (35.1 per 100,000 people in 2013), but 21,000 of 160,000 of orphaned children have been orphaned because of HIV.

Employment

According to the United Nations (2013), Eritrea is considered one of the least developed countries worldwide, and the military's continued mandatory service program has contributed to the lack of significant private enterprise growth or overall economic growth. The per capita GDP is only USD\$1,200 (CIA 2014). The Eritrean economy heavily relies on remittances from the diaspora that began during the war of independence with Ethiopia and has continued as the people of Eritrea continue to flee the repressive Eritrean government, mandatory national service, and a lack of economic opportunities. Some of these migrants end up victims of forced labor (CIA 2014). The Eritrean government, rather than discouraging this migration, actually supports it because these remittances are an important source of foreign currency and having migrants working abroad reduces local unemployment.

In recent decades, the migrant population has experienced a significant change in its gender composition, as more and more women migrate in search of better employment opportunities, typically in the fields of domestic and caretaking occupations. This feminization of transnational migration is being seen around the world and is not unique to Eritrea. Women who have migrated typically make less money than men who have migrated. Despite this gender disparity in earnings, women migrants send proportionately more money back to their families in Eritrea—60 percent of their earnings versus 45 percent for men (Kifleyesus 2012).

As is true of many low-income African countries, a large percentage of the population—approximately 80 percent—is employed in subsistence agriculture, which does not produce much, if any, income (CIA 2014). The fledgling industries of copper, potash, and gold production are predicted to help create job opportunities and drive economic growth in upcoming years; however, they will

still have to compete with military spending, and these opportunities will likely not be equally available to both men and women (CIA 2014).

Living in a historically feudal and patriarchal society with rigid gender roles, Eritrean men have been the primary participants in the economy. With limited education and low literacy rates, women have often married young and typically been confined to child-rearing and domestic work. Within certain ethnic groups, particularly in Tigre, Rashaïda, Sahoo, and Afar, women are still not provided with many educational or employment opportunities and are expected to maintain a private role, rather than a public one (Rena 2007). However, during the revolutionary war with Ethiopia, the EPLF strove to offer more educational and employment opportunities for women, so many women saw their roles shift, as they were needed in a variety of traditionally male work roles.

Overall, Eritrea's economy has struggled since it gained independence from Ethiopia, and women in particular faced employment challenges as they transitioned from a state of war back to domestic civilian life. Rather than the collective public work that it had been during the war, child-rearing and domestic work once again became the sole responsibilities of women. Bernal (2001) notes that women were “caught between the revolutionary aspirations they learned in the Front and the more conventional values and gendered expectations asserted by Eritreans in the civilian context. These heroes of the nationalist struggle found that the very qualities that made them good soldiers and comrades stigmatized them as wives and potential wives” (137). Many of these women were then considered undesirable for marriage or faced divorce; both situations result in women being economically vulnerable as females heading a household.

In 2001, women made up more than 46 percent of the overall workforce, primarily in the microenterprise sector, public sector, and manufacturing sector, likely a result of their role in the textile industry (Rena 2007). Even in the urban capital of Asmara, improved employment opportunities for women have been slow to develop, despite independence. Most of women's work is low wage, unskilled labor where opportunities for advancement are limited; however, those that have managed to receive an education and former EPLF fighters tend to have higher-paying jobs and better career mobility (Rena 2007). Therefore, improving access to education and the literacy rates are seen as key factors for improving the lives of Eritrean women.

Family Life

The history of marriage as a sacred institution and the family as the building block of society is seen throughout most Eritrean ethnic groups. Within this patriarchal system, marriage plays an important role in preserving gender bias by linking two partners in ways that support traditional marital and societal structures. The experience of marriage and divorce is highly influenced by inherited attitudes and traditional cultural practices. Customary rules of marriages vary among the ethnic groups, but girls are generally married at an early age, sometimes as young as 14, and dowries are considered a normal, expected practice. Even today, many marriages in the rural areas are still arranged by the family groups concerned.

Marriage and family life in Eritrea were disrupted and reorganized during the 30-year war for independence with Ethiopia. The EPLF deviated substantially from the traditional prewar Eritrean marriage practices: it encouraged premarital sex, provided contraceptives, and established a marriage law premised on a partnership where both men and women were guaranteed free choice (Bernal 2001; Hale 2001). During this wartime period, men and women engaged in the war effort experienced a breakdown in gendered divisions of labor and instead participated in collective family responsibilities. Thus, child-rearing, cooking, carrying firewood, collecting water, and other domestic work were done by everyone.

However, scholars have argued that the reason these gender advances were not maintained after independence was because the EPLF did not actually reframe gender relations and domestic social patterns but rather suppressed them by erasing the feminine and eliminating the family as a social institution (Bernal 2001; Rena 2007). For example, men and women fighters dressed and wore their hair the same during the war. Once independence was achieved, the EPLF changed its position and firmly reestablished the family as the primary societal building block in its efforts at nation-building. Therefore, even though the women fighters had been exposed to new ideas about gender relations and marriage, the reality that they faced when they transitioned back to life as noncombatants was that of typical, more conservative gender roles for household roles, domestic responsibilities, and the old marriage expectations.

Like many other low-income countries throughout Africa and Southeast Asia, child marriage has a deep historical heritage in Eritrea and was a fundamental part of the country's patriarchal system. When the EPLF came to

power and began seeking independence from Ethiopia, they also sought societal transformation. One of these societal transformations that the EPLF tackled was the traditional marriage practice. To do this, the EPLF introduced legislation that officially abolished forced marriages, child marriages, and dowries, which were often incentives for young marriages. Notwithstanding this legislation and the official banning of the dowry, it still occurs in practice. Traditional sociocultural norms still promote young marriages, especially in rural and less educated areas of Eritrea, so the National Union of Eritrean Women (NUEW) has been working to develop community education programs that raise awareness of the negative consequences of young marriage and early pregnancy for girls and women.

Politics

During the liberation war with Ethiopia, Eritrean women were heavily involved in the EPLF guerilla army, and not just as supporters. They were fully integrated into the war movement as platoon leaders, teachers, mechanics, tank commanders, intelligence officers, rank-and-file soldiers, and activists (Iyob 2000; Bernal 2001; Hale 2001). These *tegedalits* (female combatants or “fighter”) made up 30 percent of the EPLF, were highly regarded, and even became a symbol of the nationalist movement for independence (Iyob 2000; Bernal 2001). This stood in stark contrast to the prewar era, where women were not allowed to participate in politics.

The postwar era ushered in change for women's lives. Although women were a key component of the successful 30-year fight with Ethiopia to gain independence and had been involved in all fronts, independence and the election of Afworki as president did not liberate them. In fact, there was a deterioration of women's roles and gender equity. Despite universal suffrage at 18 years of age and a political culture of gender equality, including a highly progressive constitution that guarantees equal status for women and electoral laws that require the National Assembly and regional assemblies to reserve 30 percent of the seats for women, implementation has proved challenging. Eritrean women lament the loss of the egalitarian environment that existed during the war and are concerned about the current public portrayal of women as objects, rather than the war-era effort that conceived of women as strong and deserving of gender equality (Iyob 2000; Bernal 2001). Moreover, as independent Eritrea shifts away from a national project of liberation to one that embraces development and

capitalism, women have found themselves devalued by capitalist market values that focus attention on only certain kinds of “productive labor” that regularly excludes unpaid labor that women are far more likely to be engaged in performing, such as child-rearing, food preparation, fuel and water gathering, subsistence farming, and the like. Women are seen as less competitive than their male counterparts due to many factors, but less access to education and greater reproductive and domestic workload burdens are among the most prominent (Bernal 2001).

Religious and Cultural Roles

Eritrean society is composed of Christians and Muslims, roughly evenly divided, and is generally conservative in regard to the cultural positioning of women (Hale 2001). The Orthodox Christian tradition in Eritrea stretches back to the fourth century, when Christianity spread to Africa. This religious tradition forms an important part of the cultural expression of the Tigrinya ethnic group. In the rural areas of Eritrea, religion and religious clergy have played an especially significant role in the everyday lives of the people.

Although the EPLF has been praised for its attempts to achieve gender equality and break down the traditional cultural roles of women, especially during the 30-year war with Ethiopia, scholars have argued that the “EPLF’s approach to gender equality was grounded in Marxist ideas rather than feminist ones[,] . . . and policies regarding gender were conceived and implemented in a top-down fashion by male leadership rather than by women themselves” (Bernal 2001, 134). Women were needed for fighting in the war for independence, and thus their mobilization and emancipation was important. However, once independence had been achieved and everyone had returned to life in a postwar setting, women faced difficulty transcending their traditional cultural roles as mothers and domestic laborers. Although substantial numbers of Eritrean women became employed in wage labor after the war, patriarchal cultural traditions still strive for the ideal Eritrean family, with the female as the housekeeper and in charge of child-rearing and the male as the primary breadwinner.

Issues

Violence and Human Rights

Since independence, Eritrea has been criticized for human rights violations that include the arrest and detainment of

dissenters; arbitrary detention; the closure of the private press (the government solely controls broadcast media as well); the imprisonment of reporters; the use of torture; religious persecution (the government only recognizes and permits Muslims, Coptic Christians, Roman Catholics, and Protestants; all others are subject to persecution); compulsory national service, which is often extended indefinitely; child soldier recruitment; and discrimination (Campbell 2005; Amnesty International 2013; CIA 2014). It is well established that the government’s mandatory national service program is regularly abused to keep conscripts indefinitely and for forced labor (CIA 2014). This program, along with violence and the continued abuse of human rights, has resulted in large numbers of Eritreans fleeing the country annually, primarily to other Gulf States and African nations. Many of those who flee find themselves subject to labor and human rights abuses in the countries to which they flee

Female Circumcision

Female circumcision (also sometimes referred to as female genital mutilation) refers to the practice of excising all or part of a female’s external genital organs. There are different levels, or types, of circumcision that are variously practiced in Eritrea. Until very recently, female circumcision was a common traditional practice in Eritrea and was performed by elderly women in the village or by midwives. In Eritrea, the vast majority of circumcisions are done before puberty, with the majority occurring between birth and one month of age (Davis 1999). Female circumcision is very controversial globally and in the nations where it is most often performed. Its negative health impacts, ranging from the short-term health concerns of pain, hemorrhage, infection, sores, and injury to the surrounding area to the long-term health concerns of cysts, infertility, recurring bladder and urinary tract infections, and increased risk of complications in childbirth, have led to such international organizations as the World Health Organization (WHO) to declare female circumcision a human rights abuse (WHO 2014).

In 2007, female circumcision was officially banned in Eritrea, but the social, cultural, and, to a lesser extent, religious factors within communities and families, particularly in rural areas, has made enforcement challenging; it is still being practiced in some regions of Eritrea (BBC 2014; WHO 2014). According to NUEW, 88.7 percent of women were circumcised in 2002, compared to 95 percent in 1995.

Because of its continued practice, the Eritrean government established a project called Vision Eritrea, which has focused on providing information and coordinating educational awareness campaigns in communities to reduce the incidence of female circumcision (Holzgreve, Greiner, and Schwidtal 2012).

Human Trafficking

Human trafficking is a serious issue in Eritrea that has received more attention recently as the trend continues to worsen rather than improve. Eritrea does not fully comply with the minimum standards set for the elimination of human trafficking, and the United Nations has determined that Eritrean officials are actually involved in the trafficking of both weapons and human beings (CIA 2014; Amnesty International 2013). Furthermore, as one of the highest refugee producing countries in the world, a profitable human smuggling operation has arisen over the years.

Many of the kidnappings take place in refugee camps in Sudan that are run by the United Nations, but they have also been known to occur in Libya, Egypt, and Israel. The victims are often abused while they are being ransomed for tens of thousands of dollars, and when ransoms cannot be met, they are tortured and killed for their organs or raped and left pregnant in a new country (Connell et al. 2013). Girls are often enticed with promises of domestic work but are then forced into prostitution when reaching the destination country. According to the U.S. State Department, the “Youth Association, Women’s Association, and Workers’ Federation incorporated information about the dangers of trafficking into their regular programming, as well as through mass convocations, television programs, and poster campaigns” (U.S. Department of State 2014).

National Union of Eritrean Women

The NUEW is aware of these important issues. When the NUEW was originally established in 1979, it was affiliated with the EPLF. Today, it considers itself an autonomous, nongovernmental organization (NGO) committed to improving the status of all Eritrean women, politically, economically, socially, and culturally. With a central office in Asmara and local offices in the six zones of the country, the NUEW has 200,000 members. “The NUEW seeks to ensure that all Eritrean women confidently stand for their rights and equally participate in the political,

economic, social, and cultural spheres of the country and share the benefits” (NUEW 2017). To accomplish this, they are working to advance women’s status through literacy campaigns, credit programs, English language lessons, and other skills training. The NUEW has also been committed to providing a gender perspective by advocating, monitoring, and evaluating governmental policies and programs.

Ethiopia

Overview

Ethiopia is a landlocked country located in northeast Africa with a total population of more 96 million (CIA 2014), making it the second most populous country in Africa. The present government is referred to as the Federal Democratic Republic of Ethiopia (FDRE). Under a federal system, there are nine ethnically based states as well as two city administrations, including Addis Ababa, the country’s rapidly growing capital city.

Ethiopia is sub-Saharan Africa’s oldest independent state, forged through the incorporation of southern lands and peoples by imperial elites, originating from Ethiopia’s northern highlands. Other than a five-year occupation by Italian Benito Mussolini (1936–1941), Ethiopia has never been colonized by European powers and has served as a symbol of independence for Africans and others since the late colonial period. Ethiopia is a founding member and host of the Organization of African Unity, established in 1963 and later reorganized into the African Union.

Ethiopia is home to a large variety of ethnic groups that speak multiple Afroasiatic and Nilo-Saharan languages, and it has a unique cultural heritage involving all three Abrahamic faiths. Ethiopia’s monarchy, which ended in 1974, was dominated by ethnic Amhara and Tigray Orthodox Christians from the northern highlands and claimed to originate from the Solomonic dynasty of Israel. The Orthodox Church in Ethiopia dates back to the fourth century CE. A sect of Jews known as the Beta Israel have lived in Ethiopia for several hundred years, though their precise antiquity is unknown. Ethiopia also received the first flight (or *hijra*) of Muslims from the Arabian Peninsula in the seventh century CE, and today Muslims constitute a major percentage of the population.

The ruling party in Ethiopia (the Ethiopian People’s Revolutionary Democratic Front, or EPRDF) maintains a philosophy and style of government that encourages strong state power over the economy. The ruling party also maintains a goal of turning Ethiopia into a middle-income nation and a regional power in east Africa through 2035. Ethiopia’s economy is currently highly dependent on agriculture and international donations, but the government is pushing to diversify into manufacturing, textiles, and hydropower generation. Banking, insurance, and microcredit industries are restricted to

domestic investors, and telecommunications and electric power corporations are controlled by the government. As established in the country's constitution, all land is ultimately owned by the state. Investment options for foreign investors include textiles, leather, manufacturing, and commercial agriculture.

In 2014, the UN Development Programme (UNDP) ranked Ethiopia 121st out of 187 nations based on the Gender Inequality Index (GII). Factors behind this poor ranking include high maternal mortality, a high adolescent birth rate, and low levels of secondary education among women. In addition, women have far less control over land compared to men. These statistics are, however, improving due to government efforts to target gender equality through public policy, spearheaded by the Ministry of Women, Youth, and Children's Affairs. Close to 30 percent of seats in the parliament are currently held by women. Ethiopia's government has developed a National Action Plan for Gender aimed at eliminating discrimination that hinders women's participation in economic spheres. Women's Affairs offices have also been established in each of Ethiopia's regions, including at district and community levels.

There are concerns, however, that the state's pursuit of gender equality primarily reflects the ruling party's desire to cultivate a positive image internationally and to secure the political support of women, a heretofore undermobilized voting bloc for a ruling party that has held power since 1991 and has strongly suppressed opposition politics since 2005. Ethiopia's ruling party is accused of human rights violations that include the harassment, imprisonment, killing, and torture of opposition members, journalists, and bloggers (including women and men) and of restricting the activities of independent civil society organizations, including independent women's associations. There are also concerns that Ethiopia's large-scale agricultural and hydropower projects are having negative impacts on the environment and on women and men in many rural communities. Many people in rural Ethiopia—women and men—say they feel the government treats them as backward and ignorant and in need of indoctrination and micromanagement.

Girls and Teens

Although little research has been done outside of the urban setting of Addis Ababa, a limited number of studies have found similar expectations in rural and urban areas

regarding family roles and behaviors for girls and teens. In rural areas, there tends to be less flexibility for deviance from expected norms and behaviors. In rural and urban Ethiopia, family is hierarchical, with adults at the top, and family roles, particularly household tasks, are highly gendered. Obedience is expected from children, but girls are supposed to be even more obedient than boys. Work around the home, such as cooking, cleaning, and fetching fuel wood and water, is very often the responsibility of women and girls. For girls, helping in the home sometimes takes priority over schoolwork. Boys are sometimes expected to help haul water and do other chores, but they are often granted greater freedom to go outside of the home and interact with other people, which in some cases affords boys greater socioeconomic security.

Child Marriage and Marriage by Abduction

Despite recent government efforts to curb child marriage, it is still a common experience for young girls, especially in the northern part of the country. The legal age of marriage is 18 for both males and females, but it is widely ignored. Two out of every five girls are married before their 18th birthday, and nearly one in five girls marry before the age of 15. Ethiopian women marry approximately seven years earlier than men, but this varies by region. For example, in rural Amhara, in northern Ethiopia, up to 45 percent of girls are married by age 15 (Ross 2011; Girls Not Brides n.d.). Ethiopia's 2010–2011 *Demographic and Health Survey* (DHS) estimated that the median age for a woman's first marriage is highest in Addis Ababa (21.4 years) and lowest in the Amhara region (14.7 years). Moreover, marriage by abduction is a persistent issue in Ethiopia (Ross 2011; Population Council 2004).

Trafficking and Prostitution

Girls from Ethiopia's rural areas are routinely exploited in domestic servitude and, less frequently, in prostitution within the country. The central market in Addis Ababa is reportedly home to the largest collection of brothels in Africa, with girls as young as eight years old in prostitution. Ethiopian girls are also forced into prostitution outside of Ethiopia, primarily in Djibouti, South Sudan, and in the Middle East. A report by the U.S. Department of State (2014) indicates that the government of Ethiopia does not fully comply with the minimum standards for the elimination of trafficking, but it is actively moving toward

compliance. The Committee on the Elimination of Discrimination against Women has acknowledged that the Ethiopian government criminalizes trafficking in human beings. The committee also called for more comprehensive data on internal trafficking of women and children, it and recommended that the state adopt a national plan of action to combat trafficking in human beings. In recent years, the government has developed a national action plan against trafficking in persons and has taken significant measures to fight trafficking with the support of the International Organization for Migration.

Health

According to Ethiopia's *Demographic and Health Survey* (CSA 2014), the country's under-5 mortality rate (U5MR) dropped from 166 per 1,000 live births in 2000 to 88 in 2011; the infant mortality rate (IMR) also dropped from 97 per 1,000 live births in 2000 to 59 in 2011. The reduction in child mortality is explained in part by the improvement in accessibility of health services for the leading causes of death in children: malaria, pneumonia, and diarrhea. Ethiopia's maternal mortality ratio (MMR), as estimated by an interagency group, including WHO, UNICEF, and the World Bank, decreased from 1,400 per 100,000 live births in 1990 to 420 in 2013. DHS data provide a different trend in the MMR: dropping from 871 in 2000 to 673 in 2005, and remaining the same in 2011 (Teklehaimanot and Teklehaimanot 2013). According to DHS data, early neonatal death rates were also stagnant between 2005 and 2011 (CSA and ICF International 2011).

Maternal Health

Many maternal health indicators in Ethiopia have improved since 2000, reflecting the improvements in Ethiopia's national health system, particularly regarding access to care and the density of health care providers in rural areas. Yet, many challenges remain. Only 40 percent of women who gave birth in the five years preceding Ethiopia's study in 2014 received antenatal care from a doctor, nurse, or midwife (CSA 2014). Though low, this statistic is nearly 50 percent higher than 15 years prior. Maternal health indicators in Ethiopia vary substantially by location. For instance, urban women are more than twice as likely as rural women to receive antenatal care (ANC) from a skilled provider; ANC rates range from as little as 15 percent in the Somali region to 94 percent in Addis Ababa.

Maternal health indicators also vary by socioeconomic status. For example, ANC rates increase from 31 percent among women with no education to 96 percent among women who have received tertiary level education.

The 2014 DHS estimated that approximately 15 percent of births in Ethiopia are attended by a biomedical professional, a 50 percent rise over 2010 estimates. Birth attendance by a biomedical professional is more common among mothers under 35 years of age, mothers who'd had at least four ANC visits, and highly educated mothers. Urban mothers are six times more likely than rural mothers to give birth while attended by a biomedical professional (63% versus 10%). Outside of urban centers, the vast majority of births are assisted by a relative, traditional birth attendant, or another nonbiomedically certified person.

Rates of postnatal care in Ethiopia are even lower than ANC rates. The 2011 DHS estimates that only 12 percent of women received postnatal care within the first two days of delivery; yet, this is still an improvement over earlier estimates. Younger mothers, mothers who deliver in a health facility, urban mothers, and mothers with secondary education or higher are most likely to have received a postnatal checkup in the first two days after giving birth.

According to Ethiopia's 2011 DHS, 52 percent of children younger than 6 months old were exclusively breastfed. At 6 to 9 months, only about half of all children received complementary foods, and only 4 percent of children age 6 to 23 months were fed according to internationally recommended infant and young child feeding (IYCF) practices. Older children and children in urban areas were more likely to be fed according to IYCF recommendations. Better feeding practices are also associated with wealth and the educational level of the mother.

Access to Health Care

Rural dwellers that make up more than 80 percent of Ethiopia's total population primarily access health care from the public health system, which is subsidized by the government and international donors to reduce costs for patients. Urban residents and those with greater financial assets are more likely to access health care in private clinics, pharmacies, and hospitals. In both rural and urban areas, Ethiopian women and men often consult a variety of traditional and religious (Muslim and Christian) healers; among Orthodox Christians, it is very common to seek holy water as a treatment for illness.

Public service delivery in Ethiopia, including health care, largely falls under the control of regional (i.e., state) governments. The development and implementation of health policies are shared between the Federal Ministry of Health (FMOH) and regional health bureaus. Beneath the regional/state level, *woreda* (district) health offices are responsible for managing and coordinating the operation of primary health care. *Woredas* are further divided into *kebeles*, administrative units serving 5,000 to 15,000 citizens.

Health service delivery occurs at four levels. The first two levels deal mostly with preventive services and health promotion: a health center and its five (on average) *kebele*-level health posts. In rural areas, these are designed to provide services to 25,000 people. A typical health post has two or three multipurpose rooms for provision of services and record keeping and is staffed by 2 “health extension workers.” On average, a health center has 20 staff, including health officers and nurses, who provide both preventive and curative services. A typical health center has an inpatient capacity of five beds, including rooms for basic emergency obstetric care. Some health centers are being upgraded to provide comprehensive emergency obstetric care, which requires an operating theater with a blood bank and reliable ambulance service. Health centers make referrals to district and regional hospitals, the other two levels of service delivery. Public health facilities are allowed to retain and use the revenue they generate and to create their own governing bodies made up of local community members.

High and stagnant maternal and child mortality rates as well as low levels of access to health care are routinely cited as the basis for major investments in Ethiopia’s rural health care system (FMOH 2011). Ethiopia’s Health Extension Program is commonly identified by national and international health officials as Ethiopia’s “flagship” health initiative and the “bedrock” of Ethiopia’s attempts to expand primary health care to its rural population. Starting in 2003, the Health Extension Program involved the construction of thousands of new health posts throughout the countryside and the creation of full-time, salaried health extension worker (HEW) jobs for roughly 34,000 young women who have completed 10 years of schooling (Teklehaimanot and Teklehaimanot 2013). HEWs receive one year of health education before beginning work in a rural *kebele*, where they are responsible for a wide range of primary health care services, including preventive, promotive, and limited curative

health care as well as data collection and reporting for monitoring and evaluation. HEWs are closely supervised by district health officials, local government officials, and health center staff. In return for their work, health extension workers receive a monthly salary of about USD\$110 (as of mid-2014).

The philosophy of the Health Extension Program also hinges on creating “model households” that adopt a full package of healthy beliefs, desires, and behaviors learned from HEWs concerning maintaining sanitation and hygiene, seeking antenatal checkups, and giving birth within health centers, among other issues. Model households, the government reasons, depend on model women in particular. Model women are expected to influence other women and thus diffuse their beliefs and behaviors throughout the population.

Five years into the program, Ethiopia’s *Demographic and Health Survey* showed stagnant maternal and neonatal mortality rates (Teklehaimanot and Teklehaimanot 2013). High-level officials attributed these stagnant rates in part to stubbornly low antenatal care and health facility-based birth rates, due in part to the program’s failure to ensure the rapid diffusion of model beliefs and behaviors among women. In 2011, the government established what it calls a Women’s Development Army to help solve these problems. The army would incorporate a massive proportion of rural adult women. One woman out of every five households would become a Women’s Development Army leader, chosen for her status as a model woman. These leaders are to operate as unpaid volunteers under the supervision of HEWs, carrying out a number of tasks that include helping during immunization campaigns, keeping track of pregnancies and illnesses, and relaying messages between households and HEWs. Ultimately, army leaders are to rapidly lead other women around them toward a healthy lifestyle centered on maintaining household hygiene and seeking care, including vaccinations, antenatal care, and health facility births.

Based on qualitative work in the Amhara regional state, Banteyerga (2014) suggests that through the Women’s Development Army, Ethiopia’s government is empowering women to ask questions and to demand even more accessible and higher quality primary health care services. Through ethnographic research in another part, Maes, Closser, Vorel, and Tesfaye (2015) show that many women selected as army leaders are hesitant to take on this new role, given their many existing responsibilities as farmers, caregivers, and income generators and the lack of payment.

Others say they are happy about the army and its prospects for improving several aspects of their lives.

Diseases and Disorders

HIV prevalence is higher for Ethiopian women than men in most age groups, as estimated by the 2011 Ethiopian DHS. Among women aged 15 to 49, HIV prevalence is 1.9 percent; among men, the prevalence is 1 percent. HIV prevalence is higher in urban (4.2%) than in rural areas (0.6%). For both women and men, HIV prevalence increases substantially as the number of lifetime sexual partners increases. Almost 25 percent of women with 10 or more lifetime partners are HIV positive.

The 2011 DHS estimates that 20 percent of women and 21 percent of men were tested for HIV in the year preceding the survey and received the results. Compared to 2005 data, these figures show greatly increased awareness and utilization of HIV testing, but challenges remain. Only 14 percent of women who gave birth in the two years before the survey received HIV counseling during antenatal care. Twenty percent were tested for HIV during antenatal care and received the test results. The likelihood of HIV counseling and testing during ANC substantially increases with levels of education and wealth.

The World Health Organization (WHO) categorizes Ethiopia as a country with a high burden of tuberculosis (TB) and multi-drug-resistant tuberculosis (MDR-TB). In 2013, there were 131,677 new cases of TB in the country; new cases were slightly more common among Ethiopian men than women. An estimated 1.6 percent of new cases of TB in 2013 were multi-drug-resistant; approximately 12 percent of retreated TB cases were multi-drug-resistant (WHO 2015a).

Among Ethiopian children, acute and chronic undernutrition are major problems. Nationally, 40 percent of children under age five are stunted, and 18 percent are severely stunted, according to the 2014 DHS. According to the 2011 DHS, male children were slightly more likely to be stunted than female children (46% and 43%, respectively). The percentage of children stunted is much higher in rural areas (42%) than in urban areas (24%). Eleven percent of children of mothers with more than a secondary education are stunted, compared to 42 percent of children whose mothers have no education. Birth spacing is also related to stunting. With the exception of first births, the longer the interbirth interval, the lower the proportion of children stunted. Many adult women also face nutritional

disorders. According to the 2011 DHS, 17 percent of Ethiopian women aged 15 to 49 are anemic, and 27 percent are underweight. Only 6 percent of Ethiopian women are overweight or obese.

According to the WHO's 2014 noncommunicable disease (NCD) country profile, NCDs are responsible for substantially more deaths among Ethiopian men aged 30–70 than among women in the same age bracket. Deaths due to diabetes are uncommon among both men and women. Cancers are responsible for substantially more deaths among women than among men; in contrast, cardiovascular and chronic respiratory diseases are responsible for more deaths among men than women. NCD mortality estimates for Ethiopia, however, have a high degree of uncertainty because national mortality data do not exist (WHO 2015b).

In recent years, the experience of common mental disorders (CMD, i.e., depression and anxiety disorders) among Ethiopian mothers has received growing attention from public health researchers. Research conducted in rural Butajira in south-central Ethiopia revealed that despite strong cultural norms to celebrate pregnancy, many pregnancies are unwanted, as they constitute a burden on top of existing economic and marital difficulties. There are a number of protective and celebratory perinatal practices that women generally desire to perform, including prayer and bathing ceremonies, slaughtering a cow or goat, and receiving gifts. Several of these practices depend on wealth and having a supportive husband; thus, many women are not able to engage in these desired practices. Surveys have revealed that women who are unable to perform these practices have increased odds of postnatal CMD (Hanlon et al. 2010). Another cross-sectional survey of women of reproductive age in Butajira found that both domestic violence and extreme poverty were associated with depressive disorders (Deyessa et al. 2008 and 2009).

Education

In Orthodox Christian Ethiopia, education was historically reserved for boys and was primarily provided through the church. Even in the modern era, girls were denied access to education, which forced royal elites during Haile Selassie's reign (1930–1974) to send their daughters abroad for education. Many children in Ethiopia's Muslim communities are taught early literacy skills in mosques, which traditionally have been more inclusive of girls than the Orthodox Church.

According to Ethiopia's 2014 DHS, nearly half of women aged 15 to 49 have no formal education, and only 40 percent are literate. While formal education and literacy rates among women continue to lag behind those of Ethiopian men, both indicators are trending toward gender parity. Currently, primary and secondary school attendance rates are in fact slightly higher among girls and young women than among boys and young men.

Educational attainment is higher among urban than rural populations. In urban areas, 25 percent of women have no education compared to 53 percent in rural areas. Literacy rates also vary substantially by region: for instance, in Addis Ababa, 81 percent of women are literate, compared to less than 10 percent of women in the Somali region. Women's educational attainment and household wealth exhibit a direct relationship, with 25 percent of women in Ethiopia's wealthiest households having no education, compared to 69 percent in the poorest quintile (CSA 2005).

Expansion of Higher Education

Secular higher education in Ethiopia was initiated in 1950 with the University College of Addis Ababa. At the time, male students far outnumbered women, a trend that continued throughout the 20th century (Asgedom 2005). Between 1991 and 2010, the number of public universities in Ethiopia grew from 2 to 33. With this growth in universities came a substantial increase in enrollment numbers. Between 2000 and 2010, the number of enrolled students increased from 34,000 to more than 309,000 (Semela 2011). According to the Ministry of Education, female enrollment in government undergraduate programs was 28 percent in 2013. With the expansion of universities in Ethiopia, the Ethiopian government has adopted a focus on science, technology, engineering, and mathematics (STEM). In 2008, the government required universities to ensure that 70 percent of students pursue STEM learning; the remaining are to study social science, arts, and humanities (Saint 2004).

With the recent massive expansion of the university system in Ethiopia, focus has shifted toward quality assurance, distribution of resources, and ensuring student success. The growth of higher education in Ethiopia has also renewed interest in gender inequity and the experiences of women. Based on a case study of a public university in southern Ethiopia in the early 2000s, Tesfaye Semela found that women were more likely than men to leave the

university before finishing their degrees (Semela 2006). Female dropout or dismissal rates were higher in engineering and teacher education as compared to the social and health sciences. Through interviews, Semela found that many women dropped out due to their experiences of sexual harassment and assault by male students. Many women reported receiving requests from male students and others to perform sexual favors.

Women at the university also encountered a widespread belief that female students who are admitted through affirmative action are unlikely to succeed. On the one hand, affirmative action for female students with lower GPAs has helped fill government-defined quotas, but it has often failed to adequately support their success. On the other hand, many female students have benefited from the quota system and successfully graduated with university degrees. However, many of the female students who have benefited from the program have come from privileged backgrounds involving private urban schools.

Employment

More than 80 percent of Ethiopians reside in rural areas and engage primarily in subsistence agriculture. According to data from a 1999/2000 survey conducted by Ethiopia's Central Statistical Agency (CSA), nearly 25 million persons aged 10 years and over were employed. Of these, 14.1 million were men, and 10.8 million were women. Rural subsistence farming "employed" the vast majority of the working population: 22.2 million. The remaining 2.7 million held jobs in various formal employment sectors in urban areas (CSA 2005).

The Ethiopian Constitution states that women have a right to equality in employment, promotion, pay, and the transfer of pension entitlements. While Ethiopia is one of the few countries in the world without a minimum wage, the public sector does have a minimum wage of about USD\$30 per month. The Confederation of Ethiopian Trade Unions (CETU) is currently advocating a minimum wage in Ethiopia, with the support of many private employers and parliamentarians. The Federal Civil Servants Proclamation 515/2007 calls for preference in recruitment, promotion, and deployment to be given to female candidates with equal qualifications to other candidates. The proclamation also entitles women to maternity leave of 90 days and protects their right to work free from sexual violence and other forms of gender discrimination. Recent years have seen more women with higher education obtaining

professional employment in urban areas. Nevertheless, unemployment rates among women greatly exceed those among men. In 2006, women's unemployment was estimated to be 29.4 percent; men's unemployment was 19.5 percent (CIA 2014). Many women formally employed in urban areas hold low-paying jobs in the service sector, mainly in hotels, restaurants, and bars. Large numbers of Ethiopian women work as domestic servants in Ethiopian cities, where they also face very low wages, isolation, abuse, and a lack of job security.

Migrant Labor

Migration to the Middle East to work as domestic servants has become very common among women in Ethiopia, though it is difficult to obtain reliable data to estimate demographic totals and correlates. Part of the reason is that many travel on tourist visas. Most women who migrate to work in the Middle East (primarily Saudi Arabia, Dubai, and Kuwait) are uneducated, poor, and from rural backgrounds; however, some urban women with secondary education participate. International labor migration is driven by very limited job opportunities for young women in rural and urban Ethiopia combined with a widespread and culturally salient expectation that youth should help support their families. While working as domestic servants abroad, Ethiopian women face murder, sexual abuse, beatings, burnings, revoked passports, and unpaid wages (Anbesse et al. 2009).

According to Aida Awel of the International Labor Organization's (ILO) Addis Ababa office, 163,018 Ethiopian workers were expelled from Saudi Arabia in December 2013 after the Saudi government cracked down on undocumented migrants. Many of these returnees were women who faced multiple challenges back in Ethiopia. They were broke and in debt to friends and family members who had helped finance their initial migrations. Many were afraid to return to their families, some developed physical disabilities while abroad, and others suffered with poor mental health. The ILO contributed money to help with the repatriation of these returned workers, and the Ethiopian government reportedly contributed funds to support job training and psychosocial counseling (Migrant-Rights.Org 2014).

Family Life

In Ethiopian family life, women are highly central economic and social actors. Their shifting positions in family

hierarchies are nevertheless understudied and undervalued. Both rural and urban women spend most of their time fulfilling the basic needs of their families, including collecting water, grinding grains, preparing meals, and caring for children. In almost all lower-class families in urban Ethiopia, women's responsibilities include taking care of the house, performing chores, family meal preparation, and taking care of children. In many cases, women also work outside the home, generating income for their families through daily labor, food and drink production and trade, and farming. Most middle-class and high-class women hire housemaids, but they still supervise household chores and sometimes remain in charge of meal preparation. The lives of rural women compare with the lives of lower-income urban women, except for the significant level of farm work in which rural women engage.

Ethnographer Eva Poluha (2004) reveals how schooling teaches children in Addis Ababa their place in a hierarchy that designates lower social positions to girls, children from poorer households, and younger and physically weaker children. Although Poluha found that most of the children she interviewed accepted the prevailing gendered division of labor, there were a few instances in which children challenged these gendered roles, particularly in regard to boys helping in the home with tasks such as cooking and cleaning.

Marriage

According to Ethiopia's 2014 DHS, women head 22 percent of Ethiopian households, a slight decrease from 26 percent in 2011. Female-headed households are nearly twice as common in urban settings compared to rural areas. Twenty-five percent of Ethiopian women age 15 to 49 have never married, 61 percent are currently married, 3 percent are living together with a man, and 10 percent are divorced, separated, or widowed. Ethiopia's 2011 DHS estimates that 11 percent of married women in Ethiopia are in polygynous marriages. Rural women are more than twice as likely to be in polygynous unions as urban women. The prevalence of polygyny is relatively high in the Somali (27%), Affar (22%), and Gambela (20%) regions and among less-educated women.

Sexuality

According to the 2011 DHS, the average Ethiopian woman engages in sexual intercourse for the first time at the time of her first marriage, while the average man engages in

sexual intercourse for the first time two years before his first marriage. Less than 1 percent of women and 4 percent of men reported having two or more sexual partners in the 12 months preceding the survey. Nearly half of these women reported using a condom during their last sexual intercourse, while only 16 percent of the men reported using a condom the last time they had sex.

These rates are questionable, however, given the potential for survey respondents to give socially desirable answers to survey questions about sexuality. Lindstrom and colleagues (2010) attempted to generate better estimates of sexual activity among youth by using a nonverbal response card. With data from nearly 1,300 youth aged 13 to 24 years living in Jimma Zone, in southwest Ethiopia, a predominantly Muslim area, these researchers were able to show that the prevalence of nonmarital sexual intercourse may be twice as high as typical survey methods suggest. Among young women who used the nonverbal response card method, 5.2 percent reported having a nonmarital sexual partner in the previous 12 months, and 2.3 percent reported having two or more lifetime sexual partners. Of the never-married young women, 6.8 percent reported having had sexual intercourse. Among young men who used the nonverbal response card, 6.2 percent reported having a nonmarital sexual partner in the previous 12 months, and 4 percent reported having two or more lifetime sexual partners. Seven percent of the never-married young men reported having had sexual intercourse (Lindstrom et al 2010).

The 2011 DHS assessed the ability of women to negotiate safer sex with a spouse who has sexual intercourse with other women or who has a sexually transmitted infection (STI); 83 percent of women and 90 percent of men believe that a woman is justified in refusing to have sex with her husband if she knows he has sex with other women. Among both women and men, respondents living in urban areas, those with secondary or higher education, and respondents in the highest wealth quintile are more likely to agree that both specified behaviors are justified.

The 2011 DHS also asked male respondents who had sexual intercourse in the 12 months preceding the survey whether they had paid anyone for sexual intercourse during that time. Five percent of men aged 15 to 49 years reported that they had paid for sexual intercourse at some point in their lives, and 1 percent said they did so in the past 12 months. Having paid for sex was more prevalent among men aged 40 to 49 (13%), men who were previously

married (20%), and urban men (10%). Thirty percent of men who paid for sex in the past 12 months reported using a condom during their last paid sexual intercourse.

LGBTQ

In Ethiopia, homophobia is highly prevalent. Same-sex acts are currently punishable by up to 15 years in prison; infecting another person with HIV during a same-sex act is punishable by up to 25 years. A 2013 article in the U.S. magazine *Newsweek* claimed that legal and social sanctions against LGBTQ Ethiopians were worsening, in part due to a green light that the government had given Western Evangelical groups that promote homophobia in Ethiopia. The article notes that it is impossible for health centers, charities, publications, or nightclubs to expressly serve Ethiopia's LGBTQ community. Nearly two dozen gay and lesbian Ethiopians interviewed claimed they were scared to seek health care (Baker 2013).

According to a 2014 report by the Associated Press, criminalizing men who have sex with men and women who have sex with women is not as highly politicized in Ethiopia as it is in some other African countries. In 2014, the Ethiopian legislature planned to add same-sex acts to a list of crimes ineligible for presidential pardon, but government leaders decided to drop the initiative. In addition, the Ethiopian government in 2014 rescinded the permit of a civil society group for an antigay rally in Addis Ababa, in effect canceling the rally.

LGBTQ Ethiopians are nevertheless forced to conceal their sexuality from the public. Baker (2013) notes the importance of a few Facebook groups and initiatives that give public voices to LGBTQ Ethiopians and push for human rights protection and better health care. These include the Rainbow Ethiopia Health and Human Rights Initiative, Ethiopia Gay Library, and Zega Matters.

Fertility

The 2014 DHS showed that fertility has declined in Ethiopia from 5.5 children per woman in 2000 to 4.1 children in 2014. Rural women have twice as many children as urban women (4.5 versus 2.2, respectively). Substantial declines in fertility have taken place in both rural areas (from 7.0 to 4.5) and urban areas (from 5.1 to 2.2). The total fertility rate varies markedly among Ethiopia's regions, from 1.7 children per woman in Addis Ababa to 7.3 in the Somali region. Fertility rates are inversely related to women's educational attainment.

Reductions in fertility are due in large part to increases in access to family planning information, technologies, and assistance. The 2014 DHS revealed that knowledge of contraceptive methods is nearly universal in Ethiopia. Among married women, 40 percent use a modern method of contraception, up from 6 percent in 2000, largely due to a steep increase in the use of injected contraceptives. Use of any contraceptive method varies by region, from 64 percent in Addis Ababa to 2 percent in the Somali region. Current contraceptive use also increases with urban residence and women's education.

Politics

Attempts to redress the limited freedoms and power of women in Ethiopia have a complicated history. Royal and upper-class women under Haile-Selassie's monarchy established the first nationwide women's organization, the Ethiopian Women's Welfare Association (EWWA), in 1935. The EWWA focused on elite urban women's welfare, literacy, and etiquette, as well as supporting Ethiopian resistance to fascist Italy's invasion, and was ultimately controlled by the monarchy. It did little to question the roles of women in Ethiopia's patriarchal society or to bring women's interests into national policy and planning following the demise of the Italian occupation.

The mid to late 1960s saw the emergence of the Ethiopian Student Movement as a critic of the monarchy. Movement leaders encouraged women to participate. However, within the movement, women's issues remained subordinate to questions of class. Such subordination of women's issues to class issues and control of the state would continue through two significant regime changes in the late 20th century: the downfall of the monarchy in 1974, which gave rise to a revolutionary and repressive military Marxist regime known as the Derg, and the downfall of the latter in 1991, which brought to power Ethiopia's current rulers.

Women under the Derg Regime

Ethiopia's 1974 revolution saw the formation of multiple political parties, including the Ethiopian People's Revolutionary Party (EPRP) and the All-Ethiopian Socialist Movement (MEISON), which were largely led by Ethiopians who had been educated abroad. They sought to reduce the control of traditional elites under the monarchy and to enhance the liberties of Ethiopia's underclasses, and they emphasized the need for the emancipation of women.

Before the Derg consolidated power, it participated in an alliance with several parties, including MEISON. Soon after the 1974 revolution, the alliance established a Provisional Office for Mass Organizational Affairs (POMOA), which criticized the double oppression of women as workers and women, and set up a Women's Committee tasked with organizing women. The multiparty alliance did not hold together. From 1976 to 1978, the EPRP assassinated Derg members, and the Derg responded with massive violence called the Red Terror, leading to the death and displacement of hundreds of thousands of Ethiopians. After 1976, the leadership of the Women's Committee was replaced by appointees of the Derg, one of their many tactics aimed at taking control over the Ethiopian state and political economy.

As the Derg consolidated power in the late 1970s, it established peasant associations and local women's associations throughout the countryside. In 1980, the Derg then established the Revolutionary Ethiopia Women's Association (REWA) to increase women's participation in economic sectors, including retail, milling, education, and handicraft production. The REWA, however, did little to raise the autonomous voices of women; they were expected to support the Derg's rule and refrain from engaging in public dissent.

Meanwhile, in the 1980s, the rural branch of EPRP in northern Ethiopia and the Tigray Peoples Liberation Front (TPLF) began to engage in armed conflict with the Derg. The TPLF would eventually lead a coalition of guerrilla forces in defeating the Derg after several years of fighting. During this war, the TPLF organized its own women's associations in Tigray and enlisted up to 40,000 women as guerrilla fighters and lieutenants, who comprised approximately 30 percent of TPLF forces (Veale 2003; Burgess 2013). The accounts of women fighters indicate that many of them became members of the TPLF in part to fight the oppression of women; their inclusion in the TPLF further represented a progressive stance on gender equality within the organization and paved the way for legal and other reforms when TPLF commanders eventually seized control of Ethiopia. However, women were not allowed equal involvement in the TPLF.

At the first general assembly of the TPLF in 1979, not one woman was elected to a leadership position. In the 1984 assembly, Aregash Adane was elected into the 29-member central committee, and she remained its sole woman member for 17 years. A Women's Fighters Association was formed within the TPLF, but it was co-opted

by the male TPLF leadership. As recounted by Yewubmar Asfaw, one woman who fought and served as a TPLF cadre member for several years, the TPLF ultimately sought to subordinate women to the cause of defeating the Derg and gaining control over the country. Some TPLF women sought to pursue a feminist agenda only to face intimidation and disempowerment from men within the TPLF leadership.

Armed conflict ended in May 1991 when a TPLF-led coalition defeated the Derg. The coalition came to be known as the Ethiopian People Revolutionary Democratic Front (EPRDF). Led by TPLF commanders, the EPRDF has held power in Ethiopia to this day.

Women under the EPRDF Regime

In 1992, Ethiopia's transitional government, led by the EPRDF, instituted a Women's Affairs Office (WAO) under the auspices of the prime minister's office. Ethiopia's first Women's Policy was developed by the WAO, led by Tadelach Haile Mikael, who later became the country's first minister of women's affairs. The WAO played a key role in the inclusion of Article 35 in the 1995 Ethiopian Constitution, which states that women have the right to acquire, administer, control, use, and transfer property. More recently, the EPRDF-controlled government has pursued the bureaucratic and judicial means to protect this right. According to the World Bank (2012), significant progress has been made in protecting women's land security, particularly in cases of divorce.

Various women's civil society organizations exist in Ethiopia today, including the Women's Association of Tigray (established in 1995), the Siqqee Women's Development Association (1997), the Amhara Women's Association (1998), the Addis Ababa Women's Association (2003), and the Association of Women in Business (2010). The Ethiopian Women Lawyers Association (EWLA, established in 1995) is perhaps the country's most prominent independent women's association. It was organized to raise awareness of violence against women and women's legal rights and to challenge and reform legislation that discriminates against women in Ethiopia. The development and successes of the EWLA reflect Ethiopia's democratic turn in the 1990s.

However, since 2005, Ethiopia's ruling party (the EPRDF) has become more restrictive toward political opposition groups and authoritarian, which has had serious impacts on the freedoms of many sectors of Ethiopia's

rural and urban populations, including civil society groups focused on women's rights. In this environment, the work of EWLA, for instance, "is no longer seen [by the ruling party] as an acceptable civil society activity, but has been repositioned as a political threat" (Burgess 2013, 105). In 2009, the party-controlled federal legislature passed a controversial law that classifies local civil society organizations as "international" NGOs if contributions from abroad make up more than 10 percent of their budget. Such international NGOs are not allowed to work in the arena of human rights violation monitoring and advocacy. Because of this law, some civil society organizations, including the EWLA, have seen their funds confiscated by the government and have had to shut down or close many offices and branches. In 2010, the director of EWLA fled Ethiopia in fear of government retaliation after publicly criticizing the CSO law and providing evidence to the U.S. Department of State. The Ethiopian Women Writers Association (EWRA), a legally registered association founded to advance and disseminate the work of its members, has also met with suppression from the ruling party because many members' writings focus on social issues, including women's rights, and in some cases criticize the government.

A few Ethiopian women have risen to prominence as political opponents of the ruling party, and they have been imprisoned for doing so. Birtukan Mideksa, a young lawyer and judge, became a leader with the opposition party known as the Coalition for Unity and Democracy prior to Ethiopia's disputed 2005 national elections. The ruling party accused her and her colleagues of plotting to overthrow the constitution and sentenced her to life in prison. She was pardoned in 2007, but in December 2008, she was arrested again and resented to life in prison after giving a speech in Sweden. In October 2010, she was released again and has since attained a master's degree as a fellow of Harvard University's W. E. B. Du Bois Institute for African and African American Research.

Reeyot Alemu is another prominent Ethiopian opposition leader, teacher, journalist, and advocate of free speech. She was a columnist for the independent Ethiopian weekly *Feteh* and wrote on the Ethiopian Review Web site, becoming known for analyzing the ruling party's policies with a focus on gender inequality and the root causes of poverty. She was eventually charged under Ethiopia's controversial antiterrorism law, and in 2011, she was sentenced to 14 years in prison. A 2012 appeals court reduced the prison sentence to 5 years and dropped most of the terrorism charges against her. Reeyot has spoken out about her

mistreatment in prison, and her case has garnered international rebuke for the ruling party (CPJ 2013). She was eventually released from prison in July 2015, days before U.S. president Barack Obama visited Ethiopia to publicly address U.S.-Ethiopia relations and human rights abuses.

Religious and Cultural Roles

Women are very often excluded from the most powerful religious and cultural roles in Ethiopia, and religious and cultural traditions have contributed to various forms of violence toward women. In the Ethiopian Orthodox Church, men dominate the most powerful roles. Many island monasteries located in Lake Tana (well-known to tourists) and other sacred spaces are off-limits to women. Nevertheless, Orthodox Christians are devotees of Saint Mary (*Kiddist Mariam*), who constitutes the vehicle through which their prayers reach God. Many families give their children the name Mary, typically in the form of “servant of Mary” or “mercy of Mary.” Pregnant women pray to Mary for a safe birth, and the poor often beg in the name of Mary. Women, men, and youth form tight-knit social groups in honor of St. Mary, which meet regularly to share meals, pray, socialize, visit the sick, and perform acts of charity. A 15-day fast and subsequent feast is observed by many to commemorate the Assumption of St. Mary. The *Weddassie Maryam (Praise of Mary)* is perhaps the most popular form of private prayer among Orthodox Christians.

In the tradition of the Arsi-Oromo of Bale in southeastern Ethiopia, the moral concept of *wayyuu* affords women respect and sacredness in the eyes of men. Multiple persons and things are considered *wayyuu* in Arsi-Bale Oromo tradition, including God, one’s father or mother, the *Senqee* stick that a woman is given at her wedding, and the belt worn by a married woman. Men fear these sacred things because they fear being targeted by women’s curses. They also fear and respect *ateete*, a women-only religious ceremony in which women go to a nearby river to pray. In addition, when an Oromo woman is mistreated by her husband, she can leave her home carrying the *Senqee* stick, gather her female neighbors who also carry their sticks, and proceed to the elders of the community to appeal for justice.

Issues

Elite Women in Ethiopian History

Though Ethiopian history is mainly a story of elite men, elite women have played significant roles in state and

Orthodox Church politics (Smith 2013). The *Kibra Nagast (Glory of the Kings)*, a venerated book in the Ethiopian Orthodox Church that is more than 700 years old, tells the story of the Queen of Sheba’s visit to King Solomon of Israel, with whom she conceived a son, Menilek I, believed by many Ethiopian Orthodox Christians to be the progenitor of the Solomonic dynasty in Ethiopia.

The Sidama people of southern Ethiopia have orally passed down the history of Queen Furra, believed to have lived between the 14th and the 15th centuries. Queen Furra is regarded as an initiator of radical social change by reversing the oppression of women within Sidama culture.

Queen Mother Elleni, an ex-Muslim baptized Christian circa 1445 upon marrying King Zere Yaqob (1434–1468), played an important role in Muslim-Christian relations in Ethiopia. In 1509, she wrote to King Emmanuel of Portugal declaring an interest in a military alliance against Muslims.

In the Orthodox Church, a *gadal*, or biography, is often written after the death of a prominent religious person. One *gadal* is written about Wallata Petros (1594–1643), a wealthy woman who abandoned her husband to travel around Ethiopia to promote the Orthodox Church and discourage Ethiopians from converting to Roman Catholicism. Part of this manuscript tells of an intimate friendship between Wallata Petros and another nun, Ehete Kristose, who “live[d] together in mutual love, like soul and body” (Belcher and Kleiner 2015).

Empress Mentewab (1706–1773) ascended to power as a consort and later spouse of Emperor Bekaffa, who ruled Ethiopia from 1721 to 1730. Upon the emperor’s death, she became the effective ruler of the kingdom throughout the reign of her son Iyasu II and that of her grandson Iyoas.

Empress Taitu became regarded as an intelligent and powerful actor during the reign of her husband, Emperor Menilek II, in the late 19th and early 20th century. In the 1895/1896 Battle of Adwa, in which Ethiopia defeated Italian invaders, Empress Taitu commanded a contingent of infantry and cavalry fighters as well as women who had been enlisted to support the fighters. Later, when Emperor Menilek II was incapacitated, Empress Taitu assumed full power over the monarchy, making political appointments and dismissals. Other important women of the 19th and early 20th century include Menilek’s daughter, Zewditu, who became empress of Ethiopia from 1916 to 1930, and the lesser-known Bafena, Emperor Menilek’s consort who helped raise Zewditu.

G

Ghana

Overview of Country

The Republic of Ghana, West Africa, is a fairly recent creation. However, the name *Ghana* is ancient; it was first borne by a rich African empire in the Sahelian region of West Africa around 500 to 1200 CE (Boahen 1966, 3). The colonial territory of Gold Coast adopted the name Ghana when it obtained political independence from Great Britain on March 6, 1957, in remembrance and nostalgia for the empire's greatness. Ghana's triumph over colonialism made it a symbol of anticolonialism and Pan-Africanism for the so-called Third World people under foreign domination. General expectations for Ghana's successful development were high.

The First Republic started on July 1, 1960, under the leadership of Osagyefo Dr. Kwame Nkrumah and his Convention People's Party (CPP). A military and police coup d'état that allegedly had the involvement and sponsorship of the Central Intelligence Agency (CIA), because of the Ghana government's leanings towards socialist and communist paths during the Cold War era, overthrew the First Republic in 1966 (Mahoney 1983). Ghana's political history became checkered with military regimes, of various durations, and democratically elected and constitutionally sanctioned republics. In 1992, the Fourth Republic, which is still in force, was born after the military junta of the

Provisional National Defense Council (PNDC) led by Flt. Lt. Jerry John Rawlings, who ruled for about 11 years.

In its short and turbulent postcolonial existence, Ghana has experimented with socialist and neoliberal capitalist politics and political economic paradigms in its pursuit for sustainable development, poverty reduction, and the improvement of life in general. Like other young nations, Ghana has experienced such growing pains as unemployment and faced challenges in its moves to establish good governance and access basic needs, comprehensive health care, adequate education, transport, communication, and industrial infrastructure. The new millennium is unfolding, and Ghana's efforts to positively improve the living standards of Ghanaians, a multiethnic people, and to achieve sustainable development in confluence with the agenda and ideals of the global Millennium Development Goals are alive and unfolding too.

Topographically, Ghana is mainly low-lying and variegated into zones: savannah, derived savannah, tropical lowland or tropical rain forest, and coastal shrub and grassland. Administratively, Ghana is divided into ten regions: Upper East, Upper West, Northern, Brong-Ahafo, Volta, Asante, Eastern, Greater Accra, Central, and Western. The city of Accra is its administrative and political capital. Agriculture, mining, and retail trade have been the key economic activities in the country. Agriculture employs about half of the population. The industrial infrastructure is not big, and so the country largely produces raw materials and exports

them to the global market, especially to the so-called industrialized countries. The biggest items of export are cocoa, timber, and gold. There are some white-collar jobs, but most people, especially women, act in the informal sector of the economy and are self-employed in farming, small-scale processing, and retailing (Amu 2006).

Indigenous Ghanaians are from different ethnic groups and regions that have amalgamated to form Ghana. Demographically, the major ethnic groups are the Akan (47.5%), Mole Dagbane (16.6%), Ewe (13.9%), Ga-Dangme (7.4%), and Guan (3.7%). Alongside these are other ancillary cultural and linguistic groups (GSS 2013). The youth section of the population is rapidly expanding. Ghana's population increased from 6,726,815 in 1960 to 24,658,823 in 2010, an increase of over threefold within 50 years. The average growth rate between years of the national census has been 2.5 percent since 1960 (GSS 2013). In 2010, the female population was 12,633,978. The sex ratio in 2000 was about 97 males per 100 females. In 2010, it was about 95 males to 100 females. The high exodus of males to the global diaspora in search of better jobs is a factor for this decrease. By 2012, the estimated population of Ghana was 25,000 000, with 51 percent being females and 49 being males, giving the country an overall population density of 78 persons per square kilometer (Ghana Embassy 2014).

Since 2000, life expectancy was 54 years for males and 60 years for females. By 2010, it was around 60 for males and 63 for females. There have been signs of declining fertility, but health, maternal mortality, malnutrition of children, infant (under 5 years) morbidity, and the persistent spread of HIV/AIDS are among the issues facing the country, especially the poor in rural, suburban, and urban areas (GSS 2013).

The country enjoys rich cultural diversity in terms of various languages spoken, indigenous political and kingdom institutions and patterns of domestic organization, marriage rites, and forms of descent reckoning, namely, matrilineal, patrilineal, and dual. The experience of colonialism, which united the ethnic groups to overthrow it, is a history shared by all. Moreover, there are the common experiences of national crises manifesting shades of political upheavals and socioeconomic shocks and predicaments in the postcolonial moment. English is the official language for administrative transactions and educational instruction.

Ghana is a multireligious country, and the constitution tolerates freedom of religion and conscience. People associate with Christianity, Islam, or indigenous African

spirituality (traditionalists), which is based on the notion of communion with an unseen Supreme Creator who works with a team of nature and ancestral spirits. Other sects include Hinduism, Buddhism, Rastafari, and Mormonism. The breakdown of religious affiliation by percentage is Christians 71.2, Muslims 17.6, traditionalists 5.2, other 0.8, and people ascribing to no religion 5.2 (GSS 2013).

Overview of Women's Lives

The end of colonialism demanded a reconfiguration of Ghana's social, political, and economic terrains. The postcolonial society and governments needed to build structures to enhance and protect the fundamental human rights and well-being of all, without regard to sex or gender; to treat all fairly; and to allow and support people to fully develop their potential as members of society for society's benefit. Some people believe that women should only play the roles of nurturers, homemakers, wives and mothers, and secondary actors in agriculture and trade. Whether this is due to the colonial hangover of male chauvinism embedded within the colonial political economy, schooling system, politics, and male-privileging Eurocentric cultural notions of gender or for other cultural and religious reasons, it has had tremendous impact on women's access to society. Others believe that women should have the free and fair space to engage in all national activities to enhance their status as humans and citizens, just as men can. By playing second fiddle to men during the colonial era and, subsequently, in the postcolonial era, women have had less access and participation in Ghana's economy, education, and political systems.

Positive transformations have gradually occurred to the status of women since 1957, inching them steadily to the point of gender equity. Women's rights are being recognized within the indigenous communities and national milieu. Ghana's Constitution since the First Republic has been woman friendly, defended women's rights, and advocated for their educational empowerment and protection from social exclusion and all forms of violence, decimations and abuse of women, and forced prostitution and trafficking of young women. Since the establishment of the National Council of Ghana Women (NCGW) during the First Republic, other national organizations to promote women's affairs and empowerment have been established through the years by some governments. The Domestic Violence and Victim Support Unit (DOVVSU), formerly the Women and Juvenile Unit (WAJU), affiliated with the

Ghana Police; the Ministry of Gender, Children and Social Protection; and the Ministry of Women and Children Affairs are some of these institutions. Clearly, Ghana has been nurturing an expanding space to give women recognition and inspire them to mobilize to champion their case and cause, rise to leadership positions in society, own their beings as free and equal citizens, and be free from discrimination and physical, emotional, and mental violation of the law and other people.

Education

Education of the Ghanaian girl in the traditional setting is markedly different from that of the boy. A little girl may be the delight of her father, but it is her mother who spends the most time with her, preparing her for the responsibilities of womanhood. The mother and older females in the family teach her good feminine manners and traditional female occupations, such as caring for the young, mending clothes, and general household chores. She learns virtues such as readiness to serve and avoidance of quarrels and contentions and to respect and feel empathy toward all, even the enslaved or domestic servant. A girl's education is home-centered and family- and community-oriented, and she remains in training until she attains the age of maturity, which is attested through marriage.

The first European-administered castle schools, and later colonial schools set up in the Gold Coast, introduced formal school education to indigenous girls. By 1836, a girls' school was operating in the Cape Coast Castle in the Gold Coast. Western school education for girls did more than merely prepare them for their traditional roles in the home; education also offered an opportunity to acquire some skills to surmount certain challenges and the needs of her society. Nevertheless, negative social and cultural perceptions about the formal education of girls prevented many girls from accessing this education. For example, many parents saw the long hours spent away from home as a disruption of informal home-based education. Subsequently, few girls were able to enroll in both mission and government schools. This trend did not change much after independence.

An increase in the enrollment and retention of girls in school is still a work in progress. The 1984 national census recorded a percentage ratio of 55 to 45 in male-female enrollment at the elementary school level, a significant drop in secondary school enrollment, and an alarmingly low enrollment of teen girls (17%) at the university

level. Ghana's Ministry of Education (MOE) 2013 report recorded increased rates in gender parity at all levels of girls' education, except in junior high school. The rates suggest an improvement in attitudes, especially those of parents, toward the school education of females.

Family Responsibility

The life of a Ghanaian girl or teen is attended by many responsibilities, most of which she undertakes for her family. She is expected to perform her family duties, which include but are not limited to house chores, assisting in the care of younger children and the elderly and invalid, and partaking in religious activities of the family, with a diligent, respectful, and positive work attitude. Girls as young as four years old may run light errands for the provision of food for the household, and this would not be considered strange or as child labor. Rather, this is training in responsibilities and toward maturity and service to society. As a girl grows into a teenager, her responsibilities alter, and greater demands appropriate to her age are made. Responsibilities such as meal provision, decision making in family matters, housekeeping and laundry, settling of disputes between younger (often female) siblings, supervising school assignments, and babysitting fall to her.

A girl must excel in the training given to her by her elders and honor her family's name by comporting herself in moral matters, such as not engaging in premarital sex and not getting pregnant out of wedlock. Even though teen pregnancy is frowned upon in the traditional society, statistics by the Ghana Coalition of NGOs on Health (GCNH) indicate a rate of approximately 750,000 teen pregnancies in Ghana annually (Annicchiarico 2013). Ghana continues to grapple with increasing rates of pregnancy among its teens in contemporary times.

For most groups, the onset of menarche marks a transition from childhood to womanhood, which confers on the "new woman" new responsibilities. In addition to the traditional chores, school-aged girls accompany their parents, especially fathers, to social functions, a thing that would have been unheard of in the past. A new trend in family responsibility is the provision of tech support for less cyber- and tech-savvy parents and family members in a technologically advanced world where the Internet and digital protocols rule.

Although the humanistic principles of Christianity, Islam, and Western school and indigenous education instruct the ideal of dealing tenderly with females because

they are delicate and should not be forced into brute labor, it is not uncommon for a female child or a teenager newly initiated into womanhood to experience the opposite. She may become the victim of forced marriage or a servant or slave to the wealthy, or she may be sold into the sex industry to offset family debts. These criminal arrangements, grossly offensive to human dignity, may be explained by the offending parent or guardian as a fulfillment of the girl's responsibility to her family.

Child Marriage

Ghana has legislation against child marriages. Any marriage that occurs when a girl is below the age range of 16–18 years is considered child marriage by Ghanaian law. Despite this, the practice persists because of some strong sociocultural norms. The prevalence rate of child marriage is high. It is highest in the Upper East Region (50%) and lowest in the Greater Accra Region (11%) (UNFP 2010).

Health

Access to Health Care

Ghana only spent 3.6 percent of its gross domestic product (GDP) on health care in 2014 (WHO 2015). Life expectancy is only 60.95 years, and women live a couple more years than men do. Thirty-eight percent of the population is under the age of 15 (WHO 2015). Improved drinking water is available to more than 80 percent of the population, but less than 20 percent has access to sanitation facilities (WHO 2015). Diseases such as cholera, yellow fever, and meningitis are common (GHS 2014). Equity gaps continue to persist, especially in rural and remote areas. The national health programs work to improve health outcomes, but only when they are available. Ghana Health Services (GHS) found that inadequate programs in certain areas contributed to declining immunization rates in 2014. In districts that received ample attention, rates are greater than the 80 percent target, but only 71 percent of districts are achieving this standard, leading to a 23.6 percent reduction in immunization coverage between 2013 and 2014 (GHS 2014).

Maternal Health

More than 24 percent of women in Ghana use some form of contraception, and the fertility rate in 2013 was 3.9 (WHO 2015). For a woman between the ages of 15 and

49, there is a 17 percent probability that she will be ill or die from maternal causes. The maternal mortality rate is 143.8 per 100,000 in 2014. The GHS has worked diligently in recent years to address maternity care. More than 76 percent of women attend four or more antenatal appointments, and 56.7 percent are attended by a skilled birth assistant for delivery (WHO 2015). There are increasing numbers of midwives serving Ghanaian women, and this positively affects the increased family-planning rates and antenatal care rates and the steady decline of maternal and infant mortality rates. There is one midwife for every 1,374 people (GHS 2014). The mortality rate for children under 5 years old has also declined from 1990 to 2013 (WHO 2015). The GHS is addressing the high pregnancy rates of teens; 39 percent of pregnant women are 10–24 years old. All were offered comprehensive abortion services (GHS 2014).

Abortion has been legal in Ghana since 1985, “provided it is carried out by registered medical practitioners in registered facilities and where a pregnancy is the result of rape, incest, its continuation would result in injury to a woman’s physical or mental health, or the [fetus] has a substantial risk of a serious abnormality” (Aniteye and Mayhew 2013). Even though it is legal, unsafe abortion rates are high and contribute 22–30 percent of maternal deaths, “making unsafe abortion the highest contributor to maternal mortality in Ghana” (Aniteye and Mayhew 2013). Abortion is a target area for the health services because of its impact on maternal mortality rates where legislation has had little impact on the reduction of these rates.

Diseases and Disorders

Ghana has had great success with immunization programs and has been polio free since 2008. Maternal and neonatal tetanus rates in 2011 were zero, mortality due to measles was zero by 2003, and the successful treatment of tuberculosis is at 86.5 percent.

Cardiovascular disease contributes to 15 percent of women’s deaths; asthma, hypertension, diabetes, and sickle cell anemia are other noncommunicable diseases that women are most likely to be treated for (GHS 2014). Hepatitis, yellow fever, and meningitis have all affected significant numbers of the population in recent years, and a cholera outbreak affected 29,000 people last year (GHS 2014).

Five tropical diseases are monitored through the health program. With WHO, UNICEF, and JICA, GHS launched a major campaign to eradicate Guinea worm, including

education, contests, and safe water interventions. Malaria is considered a pandemic in Ghana, and control activities are the focus of GHS; 68 per 100,000 people in 2012 died from the disease (WHO 2015). Treatment for malaria and the distribution of insecticide-treated nets (ITNs) have been the focus, and nearly 4 million nets were distributed through pregnancy centers, schools, and town centers (GHS 2014).

HIV rates are 1.37 percent, but women are disproportionately represented: 57 percent of HIV cases are women (Ghana News Agency 2015). Treating pregnant women early with antiretroviral (ARV) therapy is proving effective in preventing transmission from mother to child; 2 percent of the 717,638 pregnant women who received HIV testing and counseling tested positive for HIV. More than 5.5 million male and female condoms were distributed in 2014 (GHS 2014).

Employment

Occupations and Employment Status

Participating in the labor market is an issue of survival for some women. For others, it gives satisfaction to an altruistic desire to contribute to the well-being of others. The economically active female population generally works as skilled agricultural, service, and sales workers. Traditional occupations for women include farming, fish mongering, housekeeping, teaching, nursing, hairdressing, dress-making, trading, engineering, lecturing, and working as a bank teller, lawyer, or medical doctor. Less mainstream occupations include being a writer, a poet, an architect, an artist, a musician, or a dancer. The population census of 2010 indicated that 11.4 percent of female workers were employees in both the public and private sectors, 69.4 percent were self-employed entrepreneurs, 8.7 percent were unpaid family workers, 1.3 percent were casual workers, 2.9 percent were apprentices, and 0.7 percent were domestic workers (GSS 2013).

An observation of employment trends shows that women are more likely to dominate informal economic activities in agriculture, industry, and services than men. Many operate in the private informal sector, while men dominate the formal sector. The majority of women in the formal sector operate in the lower and nonmanagerial ranks, which makes their voice inaudible in decision making that concerns their employment. Few are in the higher echelons of influence and power within the public and formal sectors.

Pay

As at May 1, 2014, the minimum wage in Ghana stood at USD\$1.36 per hour (6.0 Ghana cedis). However, the degree of educational qualification and experience of a woman, the type of work she performs, and the size and magnitude of profit of the firm she works for usually determine her remuneration. As citizens of Ghana, women workers, according to the Labour Act 651, are entitled to fair wages, timely payment, holidays, and leaves. The labor laws and Ghana's Constitution of 1992 guarantee equal pay for work of equal value, irrespective of gender. This principle applies to the single spine salary structure, which is the current public-sector salary structure, and ensures that without discrimination women in public-sector work receive the remuneration due them. Nevertheless, a gender pay gap exists in most work in the informal sector, implying a significant wage discrimination against women and gender gap in returns of the earnings (Verner 1999; Addai 2011). Thus, women employees in informal work in the private sector tend to receive a lower wage than men (Verner 1999).

Maternal Leave

Women employees are entitled to maternal leaves, usually spanning weeks, in the event of pregnancy. Ghana labor laws do not put a limit on the number of times a woman may apply for a maternal leave. The leave must be granted to employees who produce a medical certificate by a qualified medical practitioner or midwife indicating their due dates. It is criminal for an employer to withhold salary and other benefits or to terminate the employment contract of an employee pregnant woman on maternal leave on grounds of her absence from work.

Family Life

Marriage and Household Roles

Despite a surge in the rates of divorce, domestic violence, and marital distress (Anim 2012), the traditional view of an unmarried woman as incomplete, unfulfilled, and irresponsible operates as a powerful force that compels a majority of Ghanaian women onto the marriage path. In 2012 alone, 7,066 women registered marriages with the Accra Metropolitan Assembly; 468 ended in divorce (GhHeadlines 2014). Heterosexual marriages within the frames of customary, Islamic, and ordinance marriage are three forms of matrimony that are legally open to a Ghanaian woman. Her marriage may begin by an arranged

betrothal, known to the Akan as *asewa*, or a marriage by common consent, where she chooses her marriage partner. She may also marry as a means of offsetting family debts. Typically, arranged marriages are more common in the rural areas of the country, whereas marriages by consent are more common in the urban centers, due to the individualism the urban spaces afford people.

Most married Ghanaian women take full responsibility as wives and homemakers for their households. A study by Forster and Offei-Ansah (2012) revealed that they fulfill marital obligations, assist with family decisions, do chores, supervise domestic work, lead religious activities, and provide money for maintaining the home. Achieving the latter requires the woman to take a job outside the home, to attend an academic institution for training for the job market, or to accept a higher-paying job offer, which may take her to a new locality and could be in another country. Many engage paid domestic workers to perform their family chores, and some depend on the extended family, where mothers, aunts, or female cousins may step into the role of the absent homemaker and administer the household in her stead.

Politics

Ghanaian women have come a long way in contributing tremendously to Ghanaian politics—both the indigenous ethnic politics and national politics of Ghana. Although the division of labor has traditionally been demarcated by gender, some roles and responsibilities overlap at times. There are no gendered roles in national politics. Within indigenous politics, women by custom have complementary political roles and statuses to the men. While men tend to head lineages and communities, women play both formal and informal roles as important decision makers and political actors. There is a kind of duality of power in the political systems of most ethnic groups. This duality shows the indigenous notion of a cosmological complementarity of male and female essence. Thus, the custom of most groups permits women to be clan leaders, female chiefs, and warriors and to constitute military companies in the defense of their communities.

Among the Akan, Ewe and Ga, for example, this complementary duality of power manifests at the apex of the political institutions and state organization, where female chiefs are members of the general assembly of state chiefs and council of elders and participate in legislative and judicial processes such as the declaration and unmaking

of war and the distribution of land. They can hold their separate courts and lead impeachment of the male chief, which could lead to his removal from office. Their views and approval must be sought by the council of elders and the community in the selection of eligible male chiefs. Known as Ohemaa, Mamagah, and Mannye among the Akan, Ewe and Ga, respectively, the woman chief depicts the existence of female power and recognition of women as political beings. Women are permitted to organize and send deputations with petitions to the male and female chiefs. They can embark on demonstrations against the making or unmaking of certain policies in the community. Under the female leader, their symbol of political power, women can even demand the removal of a public officer.

This traditional political position of women is not clear today because of the dominance of and focus on national politics that evolved from Western colonial political notions. The advent of colonial rule, which introduced Western formal schooling and the introduction of Abrahamic religions of Christianity and Islam, greatly altered the indigenous political status of women. These were all male-centered, which privileged males and pushed women to the fringes of society and politics. Few women had access to Western school education, and so few had new opportunities for autonomy within the modern cash economy and urbanization. The colonial cash economy removed certain indigenous customary structures, such as independent access to resources and economic enterprises and the symbiosis of the sexes based on an efficient division of labor, that provided significant autonomy to women. Instead, the colonial regime imposed new forms of subordination through differential access to resources and economic autonomy in the modern economy.

While emphasising the schooling of the African male, the colonial order superimposed the European 18th- and 19th-century aristocratic male chauvinistic notion of appropriate gender roles and relations in politics. Women were therefore relegated to the background of politics. The colonial regime instituted a tradition of male hegemony in the frame of the modern politics of the colonial territory and later independent state of Ghana. This weakened, but could not kill, the indigenous right of women to act in politics. This transformation and bias set the tone for the existence of certain gender inequalities within Ghana's national politics in the postcolonial context.

The customary political rights of women did not die in the unwritten constitutions of indigenous polities, so women partook in the African struggle for

political autonomy from colonialism. For example, Nana Yaa Asantewaa, one female chief of the Asante people, inspired her people to fight the British in 1900. In 1917 to 1918, women were active in cocoa resistance to frustrate the British colonial economic enterprises in the country. After independence, women have been “increasingly active in [nonfarm] economies” and in national politics (Newman et al. 2000, 2; Nketia 2005). No legislation in the postcolonial era has prevented women from taking part in politics. Yet, while some governments encouraged women to access their political rights and participate, others paid lip service to the idea or did not actively motivate women. All the constitutional governments protected the right to participate in politics. The military juntas did not make decrees that enforced gender inequality in respect to political participation. However, these rights in practical circumstances have not counted for much for some regimes.

According to Nketia (2005), the treatment of women in politics before 1992 depended on the degree of elitism in a government. The military juntas of the National Liberation Council (NLC), National Redemption Council (NRC), and Supreme Military Council (SMC) were very elitist and did not make women a significantly integral part of their “male soldier” government. They did not tolerate political opposition, and one could be part of politics if he or she was directly or indirectly part of the government. Thus, women were largely excluded from politics. The governments of the Second and Third Republics were democratic but filled with similar elitism—intellectual elitism in the former and old political elitism in the latter. Thus, few women were able to be part of the parliament. With the exception of Nkrumah’s CPP and Rawlings’ PNDC regimes, no government before the Fourth Republic made strong efforts to place women in the mainstream of national political activity. The two leaders deemed their governments as revolutions that should engage all people without regard to gender or educational standing.

Many women occupied major positions as policy makers and advisers and contributed greatly to the country’s political and governmental affairs. Although women have had the franchise since 1955, and some have served in political offices as ministers and ambassadors, Ghana has not yet had a female president. However, two notable women have aimed for the presidency: Akua Donkor, who is unlettered but the founder of the Ghana Freedom Party, and Nana Konadu Agyeman Rawlings, a university graduate and former first lady, have made attempts to become president.

Since their days as cadres in the liberation movement, women have not departed from national politics. Socialist in orientation, Nkrumah and the CPP successfully pushed for an affirmative type of legislature to purposefully make 10 women members of the new Republican parliament. The NCGW was created as a mass movement to encourage women’s participation and guarantee that right in national politics. Women parliamentarians numbered 18 in 1965. The military junta that overthrew the CPP and the Second Republic, and the military junta that overthrew it, were not proactive in given women access, representation, or participation in government and politics. About five women entered parliament in the Third Republic. The PNDC overthrew the Third Republic on December 31, 1981, and women’s participation in politics vigorously resurged.

The first lady, Mrs. Rawlings, assumed a strong position in national politics. Her clarion call was female empowerment. Her husband, Jerry John “J. J.” Rawlings and his PNDC made several women, including Joyce Aryee, Ama Ata Aidoo, Aanaa Enin, Esi Sutherland Addy, Mary Grant, and Vida Yeboah, leading members in the government. Mrs. Rawlings led a mass movement for women called the 31st December Women’s Movement, which was formed in 1982 (Daily Graphic 1982). Like the NCGW, the movement aimed “to mobilize women’s initiative to awaken them politically ... to promote and protect the interest of women in the new society and to get women themselves looking after their own interests” (Shillington 1992, cited in Nketia 2005, 76). Rawlings supported it and opined that national problems could be stopped if an end would be brought to the habit of making women responsible for only bringing up children in the home (76). Embodying the aspiration of women to be part of the nation-building efforts, it organised workshops, owned economic enterprises, embarked on educational campaigns on the political rights of women, and engaged its women in national dialogues and expressed women’s views in national issues. Many women worked as cadres of the PNDC regime and sustained the revolution until the Fourth Republic was born.

Because the movement woke many women into the limelight of national politics, their visibility in partisan and national politics has become stronger since 1992. The Fourth Republic Constitution clearly dictated that the state shall take measures to “achieve reasonable regional and gender balance in the recruitment and appointment to public offices.” Furthermore, “a person shall not be discriminated against on the grounds of gender, race, colour, ethnic origin, religion, creed or social or economic status.”

Additionally, “citizens have the right and freedom to form or join political parties and to participate in political activities subject to such qualifications and laws as are necessary in a free and democratic society and are consistent with this Constitution” (Republic of Ghana 1992, 36, 16, 24). This provides a fair field of play for all who are capable and interested to participate in politics and to freely exercise their political rights.

Since 1992, many women have been appointed as district chief executives, regional ministers, council of state members, and members of parliament (MPs). Ghana had its first female speaker of parliament, the Rt. Hon. Justice Joyce Bamford-Addo, whose tenure was from January 7, 2009, to January 6, 2013. Women have contested to represent constituencies in parliament and to lead political parties. Samia Nkrumah, Kwame Nkrumah’s daughter, became an MP in 2009 and the chairperson of the CPP. Since 1992, women’s involvement in ministerial offices have been significantly connected to education, policy making, culture, tourism, health care, and gender issues.

Religious and Cultural Roles

The famous Kenyan professor John Mbiti described Africans as “notoriously religious” because religion permeates all aspects of their lives (Mbiti 1969, 1). Most Ghanaians are inclined to religion and believe in the supernatural. A plethora of religious groups exist in Ghana; however, the triple heritage of Christianity, Islam, and the indigenous African path of spirituality are dominant. Islam in Ghana and West Africa emerged primarily through trade contact with Islamic North Africa around the 7th century. Portuguese explorers and missionaries reached the Gold Coast in the 15th century and built a fort there in the 1480s. They and, later, other European missionaries introduced Christianity there. Islam and Christianity met indigenous paths of spirituality. The latter has continued to survive, and many Christians and Muslims partake in rites and ceremonies of the indigenous paths because they are organically connected to family culture and history. Certain Christian and Islamic sects even invoke elements of practices and beliefs of the indigenous paths as reinterpretations of Islam and Christianity in idioms of African spirituality.

Most women in Ghana are religious because of religion’s nature as a giver of hope for a better tomorrow and its promise of supernatural intervention in situations of hopelessness, poverty, and discrimination, which many women feel. Women culturally deem themselves as

responsible for the protection of society. Religion is one platform they use to seek divine guidance for Ghana. In recent times, women religious groups, such as the non-denominational nationwide Aglow Women’s Christian Fellowship, and Muslim women have organized national prayer services for divine protection for Ghana. Women do not only follow religion. Many lead as ritual specialists—priestesses—within indigenous spirituality, and several work in the clergy as ordained ministers.

Ghana has a spectrum of ethnic cultures with ideas that define the cultural role that women of each group must play. However, some shared ideas have coalesced into a general, broad Ghanaian cultural notion about the roles that are expected of women. Fundamentally, marriage is expected of all women of good health and sound mind and character. The customs of many groups demand females to go through nubility rites before marrying. Generally, the demeanor of a marriageable woman is expected to be morally pleasing and modest to endear her to suitors. Most women cherish the idea of marriage because it brings respect to them and their family, and it affords them the venerated status of mother. A woman can become a mother outside marriage, but the preferred motherhood is the one obtained through marriage. Spinsterhood, lesbianism, and barrenness are frowned upon. Motherhood and fertility are cherished because they sustain society.

Consequently, women’s major cultural role in all the ethnic groups is procreation, the valuable biological reproduction of society. All the groups believe that the survival of the family or lineage depends on the existence of a female member. For the matrilineal societies, no matter how many men there were, if the female sex became extinct, the family would last only the span of these men (Aidoo 1985, 18). Women, as custom dictates, are central figures in both their extended and nuclear family. As sister and aunt to their brother and his family and as wife and mother in her nuclear family, she is an authority in family decisions. Being the sister or mother of grown children, especially males, she is consulted in all decisions made by her brothers or sons. As a wife, she is mandated to contribute to the making of the family as a breadwinner or family purse controller. This, however, depends on the husband’s awareness of the customary authorization given to the women.

Polygyny is accepted by all the ethnic groups for cultural reasons, such as the creation of more people for labor for family economic enterprises. However, polyandry is not practiced. Customarily, a woman is expected to be accommodating to polygyny. A wife must take a pacification fee

from the husband before he can take another wife. Except in the few cases where a wife, by custom, maintains a duolocal residential pattern by living in the family home and the husband's, she dwells with her husband. Customarily, a wife is expected to birth a lot of children. Ten is a commendable number. This practice has minimized because of economic hardships in contemporary times. A wife is supposed to be obedient to her husband, faithful, hardworking, helpful, not quarrelsome, and not lazy. Wives, and women in general, are expected to work hard and contribute to the economy of family and community. Many cultivate the land, some being at the forefront of planting, harvesting, and processing Ghana's cocoa, and maintain households. A traditional woman dreads being referred to as lazy and idle. A woman who has children must be motherly, which requires her to provide nourishment and shelter for her children and, when necessary, those of others and for strangers, because she is essentially a mother of all.

Issues

Despite the different socioeconomic and political adversities that bedevil the country, Ghanaian women in different spheres of operation and locales have emerged as the vital backbone of the contemporary family and society. Tagged with the primary identification of wife and mother, women continue to maintain a complicated and tedious work schedule in the home and outside of it. Rural women maintain children and households and hew firewood. Their field tasks include farming, storing food, and tending livestock. Pivotal to both subsistence and cash crop farming, they feed their families with their produce and sell some or give them to middle marketers for forwarding to the urban markets in Ghana and overseas. Ghana's agricultural labor mainly depends on women. The coastal women do not fish; nonetheless, they support the male fishers by receiving, processing, and preserving fish by smoking, drying, or salting. They feed their families with the fish and care for their families with the proceeds from the sale of fish.

The urban women are often more educated in the Western formal school ways than their rural counterparts. Thus, many work outside the home as professionals and civil servants and operate in managerial and administrative spheres of companies. Due to the numerous factors of rural urban migration, some rural women possess little or no school training and gravitate to urban spaces. Determined to survive in the big towns and cities, they end up in rough and exploitation-prone jobs as *kayayo* (porters),

street hawkers and peddlers, and *ashawo* or *too-too* (commercial sex workers). Despite prevailing challenges confronting them because of certain entrenched socio-cultural notions, women have been seeking solutions on their own behalf. Some urban women articulate general women's concerns on issues such as forced marriages, wife battering, human trafficking of females into sex slavery and prostitution, female circumcision, hunger and malnutrition, rape, inadequate maternal care, unemployment, and general poverty. Thus, activists such as Esther Ocloo, a famous food processor; Annie Jagge, a former Ghanaian Supreme Court judge; Nana Oye Lithur, minister of state; Grace Omaboe, an ace actress; and Mrs. Rawlings campaigned for women to live well in an environment and spirit of social equality and justice. For example, Ocloo and 14 other women created a financial institution to assist women entrepreneurs through the establishment of a branch of the U.S.-based Women's World Banking. Women's rights activism secured an amendment to the rape law in Ghana's criminal code, which conferred a minimum of three years in jail on rapists.

Parliament also prescribed female circumcision, or clitoridectomy. Although some Ghanaian communities that have been influenced by certain religious orientations and foreign cultural idioms circumcise women as a mark of femininity, most Ghanaian ethnic societies deem the practice unwholesome and hazardous. A mature adult female can voluntarily undergo circumcision, but it is a punishable offense under Ghana's law to subject infant, adolescent, and pubescent girls to it. Women's rights advocacy also inspired the passing of Article 22 of the Fourth Republic Constitution, which entitles a spouse, of either gender, a reasonable proportion of an estate in the presence or absence of a will. It also permits both spouses, upon divorcing, to have equal share of property acquired during the marriage.

The ideal beautiful woman in Ghanaian culture is a combination of strength, dignity, intelligence, and good looks and the central role she plays in the survival of her family. Her physique should consist of a blend of unblemished skin, preferably dark and shiny; woolly supple hair, long or short, braided or plaited; unblemished teeth; and strong legs and back, which are deemed necessary for carrying children. A furtive glance, pleasant smile, low voice, and the ability to cook and dance signify beauty. Her bosom, calves, cheeks, and buttocks must be well rounded. However, Western concepts of beauty and grooming styles have influenced many Ghanaian women to the extent that some desire aspects of the Caucasian woman's phenotype,

such as light complexion and straight hair. It has become a common fashion for many Ghanaian women to buy and use imported dangerous chemicals to bleach their skin, euphemistically calling it “skin toning”; straighten their kinky hair; or wear imported expensive hair pieces and weave-on wigs, popularly called “Brazilian hair.” Many also prefer wearing Western-style clothes, which they deem fashionable and markers of cultural enlightenment. Still, some women maintain the indigenous standards of beauty and prefer indigenous dress styles and adornments.

Conclusion

Women of Ghana, in different locales and classes, have suffered some inequities based on their gender. Androcentric biases have restricted their full participation in national development processes. However, they have not relented in their struggle to acquire first-class citizenship for themselves and future women. Separately or in coalitions with men, women have been seeking ways to respond and change situations of gender inequity. As we reflect on the history of Ghanaian women’s struggle and significant contributions to society, we have to remember that the need to find effective ways to secure women’s right is as imperative as ever. The solution to gender inequity will not come easy; yet, opposition and risk should not deter women. The human drive to resist oppression, the passion for individual achievements and organization building, and the commitment to protect Ghanaian familial viability must continue in the psyche and actions of Ghanaian females.

Iran

Overview of Country

Iran is located in Western Asia, where it borders the Gulf of Oman, the Persian Gulf, and the Caspian Sea. It shares borders with Armenia, Azerbaijan, and Turkmenistan in the north; Turkey and Iraq in the west; and Pakistan and Afghanistan in the east. Iran is 1,648,195 square kilometers, or slightly smaller than Alaska (CIA 2017). The country has very diverse terrain that includes rugged mountainous regions, deserts, and coastal plains. As of July 2016, the population of Iran was 82,801,633, with a median age of 28.8 years (CIA 2017). The capital of Iran is Tehran, which is located in the north-central part of the country.

Iran was known as Persia until 1935, and it boasts a rich history with the Persian Empire for thousands of years. It became an Islamic republic in 1979 after the ruling monarchy of Mohammad Reza Shah Pahlavi (1919–1980) was overthrown by a revolution led by the majority of the Iranian population. The country has been in political turmoil for much of its history and has had a tumultuous relationship with many Western countries, including the United States and the United Kingdom. Iran became known as the Islamic Republic of Iran after the majority of the country voted to establish an Islamic republic led by Ayatollah Ruhollah Khomeini (1902–1989). Its constitution is based on Islam; however, some would say that the government

is highly influenced by the supreme leader, Ayatollah Ali Khamenei (1939–).

Iranians are from a variety of ethnic groups, including Persians, Azeris, Kurds, Lurs, Balochs, Arabs, Turkmen, and Turkic tribes. The majority of Iranians are Shia Muslims, who comprise about 90–95 percent of the population (CIA 2017). About 5–10 percent of Iranians are Sunni Muslims, while the remaining minority are either Zoroastrian, Jewish, or Christian. Iran currently has an unemployment rate of about 10.5 percent (Rajabova 2017).

In 2015, the UN Development Programme (UNDP) ranked Iran 114th out of 155 nations based on the Gender Inequality Index (GII, 0.515).

Girls and Teens

According to the Iranian national census, there are about 11.5 million girls between the ages of 10 and 24 in Iran (Golchin 2012). Being a teenage girl in Iran is very similar to growing up as a teenager in any country with access to constant Internet, media, and international culture. For the modern youth growing up in Iran, teenage life often revolves around self-expression.

In more affluent parts of Tehran, such as North Tehran, Western trends are noticeable and often give off the vibe of New York or London hipsters (Krever 2016). Iranian teens go out with friends and enjoy themselves. Due to government bans on drinking, clubbing, and bars, activities for

teenagers include visiting the city's many history and art museums, taking photographs, and lounging in the plentiful parks that fill Tehran. Iran has had a turbulent past that has taken its toll on citizens, but the current outlook is optimistic for the younger generation. There is a sense of hope and improvement for many Iranian youths, mainly because of the recent improvements in economic aspects of the country as well as diplomatic relations with other nations. These changes are primarily due to the nuclear deal with six countries that was pushed through by the current president, Hassan Rouhani (1948–), and the minister of foreign affairs, Mohammad Javad Zarif (1960–).

Iranians are incredibly proud of their rich history, and they are invested in the evolution and betterment of the country. Many of Iran's youth perceive that there are a lot of stigmas pertaining to the image of Iran on a global scale that often illustrate the country as embroiled in chaos and war. However, nothing could be further from the truth. Much of the younger generation fails to understand where these stereotypes regarding Iran are coming from. Iranian youths are similar to teenagers from any country; they spend their days watching movies, enjoying sports, going to school, and eating at restaurants and cafes. Similar to many countries in the world, the government is often very different from the people it governs. With improvements in transportation and access to information making the world seem very small, it has become commonplace for Iranian youth to stay involved and aware of the events and cultures of the world.

Extracurricular Activities

Extracurricular activities are plentiful and vibrant for teenagers and girls in Iran. Activities include drawing, singing, debate teams, robotics, and playing soccer, basketball, tennis, volleyball, and more. Many Iranian youths are up-to-date with global trends when it comes to pop culture, and they have the latest music; movies; television shows, through satellite TV; and fashion styles at hand. As of 2012, 76.9 percent of Iranians have a mobile phone, and about 26 percent of them are Internet users (UNICEF 2013).

Literacy

The literacy rate for females aged 15 to 24 in Iran was at 98.5 percent between 2008 and 2012 (UNICEF 2013). This high rate is often attributed to the fact that school is mandatory for all children in Iran until the secondary level.

Sex Education

Iran currently lacks any sort of comprehensive or accurate sexual health education program that is able to adequately relay the consequences of premarital sex and risky sexual behaviors to adolescents (Karamouzian 2014, 149–150). Thus, the majority of sexual health information for teenagers is mostly gained through conversations with family and other peers.

Education

The education system in Iran is split into primary education and high school education. All children attend primary school from ages 6 to 12, which is compulsory. After completing primary school, children then attend high school from ages 12 to 18. Students attend separate gender-based schools for their primary and secondary education, often until they attend university. In Iran, public schools are free, and private schools typically have very high tuition, which creates a hierarchical system for those who are able to access higher standards of education.

The school system in Iran is very competitive; the educational system is filled with exams that determine a student's ability to succeed and move forward to higher education. There is an important national exam at the end of primary school as well as a university entrance exam, the *Konkur*, that is purely merit-based. Often, the entirety of a student's education is based on preparing him or her to do well on the *Konkur*. On the national exams, subjects such as mathematics, science, Persian literature, social sciences, and theology are included. Other important school subjects that are part of the school curriculum include art, sports, work and technology, thinking and research, and study of the Koran, the holy book of Islam.

Primary School

Primary school in Iran is called *Dabestan*, which includes grades one to five. At the end of fifth grade, students take a national exam that must be passed to continue to the next level. In larger cities such as Tehran, many children have access to many resources in their schools. Girls can play sports, such as swimming, volleyball, and basketball, and participate in art classes. There are often competitions between schools in various activities, and students regularly take school trips to museums, cinemas, and theme parks.

Between 2008 and 2012, primary school participation attendance was at 96.9 percent for females, which was actually higher than male attendance. However, there is agreement that to improve universal school enrollment in Iran, there are specific disparities between provinces within the country that need to be addressed. Provinces such as Sistan-Baluchistan have net enrollment rates of 71.5 percent of girls, compared to the national average of 97.2 percent. In the small rural and remote communities outside of Tehran, special provisions were made by government authorities to have coeducational and multigrade primary schools to improve student attendance. Unfortunately, these exceptions are only available for the primary levels, which still allows the already low rate of secondary school attendance to stay down (UNICEF 2013).

In addition, other barriers for girls to education also include traditions in rural regions, such as early marriage. These poorer provinces are also plagued with harsh environments that lead to a significant lack of experienced teachers, particularly female ones (UNICEF 2013). In fact, the shortage of teachers is so prominent that men who are assigned to military duties in these areas are often enlisted to work as emergency teachers during their military service.

Secondary School

Secondary school is called *Dabirestan*. Starting in the 7th grade, English is taught as a second language in all schools and is a mandatory subject until matriculation. In their second to last year, or the 11th year of school, students are required to pick from one of two tracts: an academic general tract or a technical and vocational tract. If a student elects to go the academic route, they often follow up with a college preparatory year for students in grade 12 known as *Pish-daneshgahi*. *Pish-daneshgahi* includes intensive studying and preparation for the national university entrance exam, the *Konkur*. The *Konkur* is known for being incredibly difficult, and it determines a student's chance to enter a public or private university, with public universities being more competitive.

Among secondary participation for females, enrollment levels begin to drop heavily and are at 79.8 percent, which is a little lower than the male enrollment ratio of 82.4 percent (UNICEF 2013). Efforts must be made to ensure that children are able to complete their primary school education, especially as completion rates for girls only decline with their increase in age. Only 52 percent of 14- to 16-year-old girls completed the primary program due to

myriad factors, such as low quality schooling, lack of experienced teachers, negative attitudes toward girls' education, and an uneven ratio of female teachers (UNICEF 2013).

Because of a lack of readily accessible schools in more rural regions of Iran, many children are required to travel long distances to attend school. Several years of droughts have left the majority of rivers in Sistan-Baluchistan dry and empty. The community in these regions lives off the land, and without rain their means of existence, such as goat herds and crops of wheat and grains, have perished. Employment is especially scarce, and the majority of work is often unregulated, harsh, and low-paying manual labor. These provinces have the worst indicators for life expectancy, adult literacy, primary school enrollment, access to improved water, and infant and child mortality in Iran (UNICEF 2103). Due to these circumstances, all family members are expected to do as much as they can to support the family by bringing home an income and alleviating other responsibilities, such as child care and household chores. Girls are often expected to do household chores and take care of younger siblings, while boys run errands and do odd jobs to earn money. As a result of these circumstances, many communities view education as a luxury.

Via a partnership between Iran's Ministry of Education and UNICEF, dozens of female assistant teachers were recruited from communities and trained to teach in various subjects, such as hygiene, mathematics, science, literacy, life-skills education, and storytelling. Teachers were also trained to facilitate peer education, activity-based teaching, and multigrade classes. Initiatives such as weekly after-school classes were offered in villages and have proven to be incredibly effective.

Postsecondary School

At the higher education level, Iran has private, public, and state-affiliated universities. As of 2015, there were over 100 public and 200 private postsecondary institutions in Iran (Academic Exchange 2015). If a student is accepted to a public university, which is often very competitive, tuition is free. Students may also be able to attend a private institution, if they can pay the fees.

Today, Iran is considered very progressive in terms of postsecondary education, as seen by the fact that more than 65 percent of students entering classes at universities are women (Weiss 2012). In fact, some members of parliament have been pushing legislation to create affirmative action programs for men. Unfortunately, education has not

always led to employment for women, as they only comprise about 20 percent of the working population (Academic Exchange 2015). Iran has incredibly high rates of unemployment, particularly among the younger generation. In particular, rates of unemployment for women who have finished university are greater than for male university graduates. However, the number of female university students has almost increased twofold, from 1,231,035 in 2005 to 2,106,639 in 2012 (Academic Exchange 2015).

Health

The health care system in Iran has undergone several reforms in the past 30 years. The most important reform was the establishment of the National Health Network in 1983, with the goal of reducing health inequities and expanding coverage and access to health care in impoverished areas. Other reforms include the Family Physician Program, the integration of health services and medical education, the hospital autonomy policy, and the Health Sector Evolution Plan, all of which have had various benefits and disadvantages. Currently, Iran offers universal health care to all citizens, though it is not equitably distributed.

Similar to many other countries, there are traditional differences that exist between men and women in Iran and how they benefit from facilities. There have been many changes in regard to social, economic, and population aspects in Iran, and many of them are promising, as witnessed by the growth of the Human Development Index (HDI) from 0.443 in 1980 to 0.742 in 2012 (Joulai 2016).

The average life expectancy for Iranian women has substantially increased from 44.15 years in 1960 to 75.75 years in 2012 (Joulai 2016). Iranian women have a higher life expectancy than men; however, there is a disparity among these statistics, especially when comparing rural and impoverished provinces in Iran. Life expectancy is about 67.3 years in provinces such as Sistan-Baluchestan, while it is 75.8 years in Tehran Province, an astonishing 12.6 percent difference (Joulai 2016).

Access to Reproductive Health Care

Contraception is not difficult to obtain in Iran. If a woman wants to access birth control, it is easily accessible. Before the revolution in 1979, contraception was free; however, in conjunction with the country's current health care laws, there is a small fee associated with getting access to birth control or contraception (Wolpow 2015). In fact, Iran had

one of the most successful birth control programs in the world. At one point, the birth rate of children per woman was 2.2; however, under Mahmoud Ahmadinejad's (1956–) administration, funds for the birth control program were significantly cut (Wolpow 2015). Overall contraceptive prevalence was at 77.4 percent between 2008 and 2012 (UNICEF 2013).

In 2005, the Iranian parliament voted to significantly liberalize the country's abortion laws. Currently, a pregnancy can be terminated in the first four months if the fetus is mentally or physically handicapped or if the mother's life is in danger, but there are stipulations to this law. Parents are required to give consent, and three doctors are needed to confirm the state of the fetus.

Abortion is considered undesirable in current Iranian society and is often seen as a last resort due to the abundance of contraceptive resources for Iranian women. However, there is a growing concern that Iran needs more sex education to reduce unplanned pregnancies, as thousands of women utilize expensive and often dangerous unregulated abortions (Harrison 2005).

Childbirth and Maternal Health

Maternal mortality per 100,000 live births in Iran has been declining. This is illustrated by the reduction of maternal mortality rate (MMR) from 83 to 23 per 1,000 live births between 1990 and 2013 (Joulai 2016). Unfortunately, this decrease is not evenly distributed across the country, as there are many differences among various provinces in access to care, with a concentration of unfavorable conditions in the border provinces.

Studies have shown that approximately 90 percent of the MMR is due to defective emergency midwifery services, specifically poor service quality and lack of facilities. All criteria associated with mother's health have seen improvements, except for the rate of cesarean delivery. Approximately 45.6 percent of births in Iran are via cesarean delivery (Joulai 2016).

Female Circumcision

Some studies have indicated that female circumcision or genital mutilation (FGM) is performed at a rate of more than 60 percent among some ethnic groups in Iran (Joulai 2016). Iran's southern province of Hormozgan has the highest incidence of FGM in the country. Research shows that FGM is primarily a practice of the Sunni Muslims in Iran, and only a small fraction of the Shia population

practice FGM (Dehghan 2015). The reasoning behind FGM is often attributed to tradition, cleanliness, religious recommendations, and control of sexual desire. However, less than 3 percent of respondents named religion as their reason for practicing FGM, which has been found to be inversely related to level of education (Joulaei 2016).

Gender, Power, and the Sexual Dynamics of HIV/AIDS

HIV/AIDS has been skyrocketing in Iran. The number of people living with HIV has increased from 43,000 in 2006 to 110,000 in 2016. The prevalence of HIV/AIDS in Iran, which has increased 546 percent over the span of eight years, is an alarming and significant health problem among females (Joulaei 2016).

According to the United Nations, Iran has the highest percentage of drug addicts in the world, with 3–4 million people addicted to heroin or crystal meth. About 700,000 of these addicts are women, and this number doubled over the years 2012–2013 (Gaita 2014). Additionally, Iran has the highest per capita consumption of opiates in the world. About 60 percent of imprisoned injection drug users (IDUs) in Iran are infected with HIV, and 62 percent of AIDS cases occur among IDUs (Dolan et al. 2007). According to some studies, about 10 percent of users are women (Gaita 2014). Thus, substance abuse is a severe public health issue in Iran, and with the median age of the population less than 29 years old, there is much information to be learned about

various aspects that help propagate this issue. However, there is a lack of services for women on a large scale.

As of 2014, there were 29 women-only drug treatment centers. Between 2007 and 2014, there were about 6,000 women voluntarily admitted to these centers (Alam-Mehrjerdi 2016). Treatment options included counseling, syringes, and condoms to help reduce high rates of HIV. Unfortunately, most Iranian drug initiatives cater to male users. With the adoption of Western policies in 2000, Iran has seen the implementation of Triangular clinics, needle syringe programs, national addiction phone lines, and more internationally approved drug treatment programs (Alam-Mehrjerdi 2016).

Pop culture and media have even been utilized as educational tools for the public. There are Iranian television shows that talk about drug issues, and, recently, soap operas have adopted public health education. Soap operas have a huge following in Iran. This past year, one called *Parya* was developed. The premise is that a beautiful young woman is engaged; however, her fiancé goes to a party and is injected with a dirty needle, thus contracting HIV. In an attempt to educate the Iranian public about HIV, the show explores aspects of HIV, such as health, various medications, and how HIV is contracted, and it actively combats the prevalent stigma that associate HIV with substance abuse and blaming of the victim.

Diseases and Disorders

Women shared 32.7 percent of the burden of all noncommunicable diseases in 2011, which is an increase from past years. The most prominent diseases among Iranian women are cardiac ischemia, depressive disorders, and osteoarthritis. Cardiac ischemia was responsible for 24.69 percent of deaths in 2011. High blood pressure was present in 16.12 percent of Iranian women, which was slightly more than men. About 25 percent of elderly Iranian women suffer from heart disease. The rate of osteoporosis in females is also more than triple that of males. Hyperglycemia is also significantly higher among elderly women, about 63.6 percent versus 42.6 percent of elderly men. Overall, studies find that physical and psychological problems are higher among Iranian women than men (Joulaei 2016).

Studies have also indicated that mental health conditions are more prevalent for men than women in Iran. Depression was ranked first among diseases in Iran in 2011. Prevalent diseases among women include anxiety and mood disorders. Suicide rates have also been climbing in Iran,

Dreams before Extinction

Iranian artist Naeemeh Naeemaei uses her paintings to warn about the possible extinction of animals in her region of the world. Her first solo exhibit, *Dreams before Extinction*, is a series of 12 paintings that use depictions of endangered species, humans, and symbols to create an emotional and imaginative appeal for viewers to respond to the crises of environmental degradation. The pictures highlight the plights of the Siberian crane, imperial eagle, Caspian red deer, hawksbill turtle, Persian sturgeon, Caspian tiger, Persian cheetah, horseshoe bat, and Lorestan mountain newt. Overhunting, overfishing, overpopulation, and pollution have led these species to the brink of extinction. Naeemaei has become a leading voice in advocating for environmental consciousness and conservation.

and within the past few years, there is a higher frequency of suicide attempts among Iranian women. The main reason behind this increase in suicide is due to violence and family disputes, particularly with married women. In Ilam Province, the suicide rate among Iranian women is 18.7 times the total number of suicides. This staggering statistic outlines the many differences within Iran, particularly from a regional perspective (Joulaei 2016).

Employment

Iran has one of the lowest economic participations of women in the world. Only 3.5 million Iranian women are salaried workers, while 23.5 million men are salaried (*Financial Tribune* 2016). However, when they do work, women typically have good working conditions and are paid well.

Typical Jobs and Careers

Due to Iran's booming cosmetics market, the seventh largest in the world, beauty salon jobs have become one of the most lucrative professions for Iranian women. An array of positions are available, ranging from being a makeup artist and esthetician to a professional stylist, which can be available for women with or without a professional degree. A beautician's minimum salary of 30 million rials per month (USD\$860) is significantly more than the average salary of a university-educated office worker, about 8 million rials a month (USD\$230). Business experts claim that the monthly income of a beautician could even reach USD\$3,500 a month if she were able to finance a salon and recruit other specialists (*Financial Tribune* 2016).

More than 90 percent of nurse practitioners and less than 50 percent of general physicians are women in Iran, with a total of over 140,000 general and specialized physicians in the country, according to the National Medical Council. The average specialist makes about 150 million rials a month (USD\$4,300), while nurses make significantly less at around 25 million rials a month (USD\$715). There is also a need for female lawyers in Iran, particularly to represent matters such as women's divorce, cases of inheritance, disputes over property ownership, and more. The minimum annual income for a lawyer starts at 800 million rials, or the equivalent of USD\$23,000. Approximately 24 percent of bank employees are women, and this profession is competitive due to the job security, stable pay, and added benefits that come with the position, such as access to loans (*Financial Tribune* 2016).

Overall, 33 percent of Iran's female labor force are in professional jobs that are concentrated in education, health care, and social services. According to the education ministry, of the 1.1 million teachers employed in Iran, approximately 532,000 of them are women. However, even though more than half of all teachers in Iran are women, only 20 percent of university teaching staff is female. As of 2015, the minimum wage for teachers was about USD\$400 a month (*Financial Tribune* 2016).

Discrimination and Income Disparity

Female heads of household constitute about 5.2 million, or about 12 percent, of Iranian households. Economically, female heads are more vulnerable than their male counterparts. About 43 percent of women heads of household belong to the two lowest income deciles, while male heads of household make up only about 16 percent. In the Sistan-Baluchistan Province, women constitute about 64 percent of breadwinners. Additionally, 9.7 percent of female heads of household suffer from disability and psychosomatic disorders, and 30 percent are unable to work due to poor health status. Gender-related poverty is more pronounced among female-headed households, at 51 percent, than male ones, which are at approximately 41 percent (Joulaei 2016).

Maternal Leave

Iran has one of the most substantial paid benefits policies globally for new mothers. Iran's maternal leave policies have placed it in a league with many European countries. A study in 2009 found that after six months of paid maternity leave, working Iranian mothers may reduce their work by one hour per day to promote breastfeeding for children. Iran has consistently shown a favorable attitude toward breastfeeding rates and the overall promotion of breastfeeding. In addition, the Iranian parliament, the *Majlis*, passed a family planning bill that increased paid maternity leave for mothers for up to nine months and created an obligatory two-week period of paid leave for fathers. However, this bill also eliminated many beneficial birth control programs.

Family Life

Family is a critical component of Iranian culture. Women particularly play a central role in family dynamics. Family members rely on each other for emotional, physical, and

material support on a constant basis. It is also expected that younger family members take care of their elders by providing them a comfortable life in their old age. Mothers are especially revered and respected in Iranian families, but they also carry the burden of family responsibilities.

Fertility and Family

As mentioned before, Iran used to have a very effective and accessible birth control program, but under the more conservative Ahmadinejad administration, these funds were stopped. However, the average family size in Iran has been heavily reduced since the 1980s, from about seven births per woman to fewer than two per woman (Weiss 2012). The typical notions regarding the average number of children per family have changed due to rising levels of education among women and men as well as resources for family planning.

The main reason behind this fertility drop is the Islamic government. In the late 1980s, Ayatollah Ruhollah Khomeini, Iran's supreme leader, issued *fatwas* making birth control accessible and acceptable for all Muslims, even conservatives. Prior to this *fatwa*, Khomeini had pushed a baby boom to replenish the large population losses sustained during the Iran-Iraq War. However, after the war, he believed that the economy could no longer support a rapidly growing population. With these *fatwas*, contraceptives were available at no cost at government clinics, rural health centers, and more. Health workers encouraged contraception to reduce maternal and child mortality, and couples who intended to marry were required to participate in family planning counseling. Thus, the birth rate plunged, and parents were able to invest more in their children's educations, even in rural regions of Iran.

Slowly, as a result of decreased birth rates, women's societal roles altered as well, with educational opportunities increasing for girls due to the resegregation of schools, which encouraged even very conservative families to send their girls to school. As the women gained educational access, their consequent influence within families grew, thus fostering the empowerment of Iranian women.

Past president Mahmoud Ahmadinejad aimed to increase the birth rate, and subsequently the population, to ideally make Iran a powerful and intimidating country. He denounced the contraceptive program as a "prescription for extinction." However, he has been duly ignored, as many would point out, and the current trend in Iran

remains to have one to two children for most families (Weiss 2012). Additionally, living in large cities such as Tehran has proven to be incredibly expensive; many families are unable to be financially sustainable, thus contributing to lower birth rates in recent years.

Marriage and Divorce

Weddings in Iran are renowned for their extravagance. Families spend thousands of dollars to celebrate a union with hundreds of family members. Recently, however, couples are being forced to pay for something almost equally as expensive, divorce. Recently, divorce parties have become a trend in Iran, and they are very common thanks to the 20 percent divorce rate. The parties have become infamous for their sarcastic invitations and humorous cakes. In the first two months of the Iranian calendar in 2014, more than 21,000 divorces were recorded. (Dehghanpisheh 2014).

Government officials are incredibly upset by the divorce trend and believe it is an affront to the values of the Islamic republic. In fact, the parliament's social affairs committee even proposed to dedicate USD\$1.1 billion of the Iranian budget to marriage facilitation (Dehghanpisheh 2014). The rise in divorce is attributed to myriad reasons, including economic problems, adultery, drug addiction, and physical abuse. Another main component is Iranians' shift toward individualism. Typically a very collectivistic culture, Iranians, especially women, have begun embracing individuality, particularly as rates of education and financial empowerment have risen. Before, when women were unhappy in their marriages, they were still dependent on their partners and remained married; however, with financial independence surging, marriage is no longer as binding.

Marriage laws in Iran typically favor the husband, as they are afforded the right to ask for a divorce, but recently, most divorce cases being brought to court are part of a mutual understanding between spouses (Dehghanpisheh 2014). If the husband is unwilling to divorce his wife, the woman is responsible for proving that the husband is either abusive, has psychological problems, or is unable to uphold his marriage responsibilities. However, women are also able to pursue the payment of their *mehrieh*, or dowry, which the husband is required to pay during the marriage. *Mehriehs* typically range in the thousands of dollars in the form of gold coins, and if the husband is unable to pay the dowry, he can be sent to jail.

Due to the skyrocketing rates of divorce, family and divorce law practices have boomed (Dehghanpisheh 2014). And with higher educational attainment for women, their priorities are changing. Marriage is shifting from being a primary priority, and with this change in society that is seen through all social classes, the overall power of women in marriage is increasing.

Sports and Recreation

President Hassan Rouhani is striving to deliver on his pledges to relax social restrictions imposed on Iranian women by previous governments. Currently, Iranian women are restricted from attending various sporting events, such as national volleyball and soccer matches, as a result of strict gender regulation policies throughout the country. Similar to previous attempts to limit gender segregation, these efforts have been met with much resistance and criticism from conservative parties, who paint these policies as Western tendencies (Tehran Bureau 2015).

Not only are Iranian women subjected to discrimination within the country, they are also prevented from pursuing their passion of sports outside of it. In 2011, the Iranian National Women's soccer team was prevented from participating in the 2012 Olympics after they were disqualified right before a critical qualifying match because the women wore hijabs. Officials decided just before kickoff that the headscarves being worn by the Iranian players were a violation of FIFA's dress code.

Sports such as tennis, judo, karate, taekwondo, shooting, mountain climbing, and rowing are very popular among

Iranian women, particularly as they are easy to coordinate with the country's veiling policies. Women's competitions are held on a national level, with leagues for soccer, basketball, volleyball, squash, kabaddi, martial arts, race car driving, hip-hop dance, and nearly 200 other sports (Tehran Bureau 2015). Attention to women's sports started when former president Akbar Hashemi Rafsanjani (1934–2017) appointed his daughter, Faezeh Hashemi (1962–), as the head of the Women's Sports Organization and the deputy chair of Iran's Olympics Committee. With Hashemi's leadership, several sports facilities opened, primarily for women, and the first games for women of Islamic countries were hosted in Iran, generating much interest in women's competitive sports on a national scale.

Politics

Women who become involved in politics are young and educated, such as Zahra Saeidi, a 29-year-old industrial engineer who campaigned and won against 10 male candidates in the province of Esfahan (Regencia 2016). Many feminist activists are thrilled at the new engagement of young reformist women in parliament, saying that change and opportunity are inevitable. However, most of the current female members of parliament are aligned with very conservative views of Iranian politics. Current laws that need to be advanced for the improvement of women's rights include the improvement of social conditions of female workers, better working hours for women, child custody, and free movement of women without male chaperones (Regencia 2016). Women are critical to Iran's development

Women's Voices

Shirin Ebadi

Shirin Ebadi is an Iranian lawyer, human rights activist, and founder of the Defenders of Human Rights Center in Iran. She was the first female judge in Iran and served until the Khomeini revolution in 1979. She has been persecuted and imprisoned for her criticism of the Iranian government. In 2003, Ebadi received the Nobel Peace Prize—the first, and so far only, Iranian to do so—“for her efforts for democracy and human rights. She has focused especially on the struggle for the rights of women and children” (Nobelprize.org 2014). Since 2009, Ebadi has resided in exile in the United Kingdom. She is the author of three books, including *Iran Awakening: One Woman's Journey to Reclaim Her Life and Country* (2007) and *Refugee Rights in Iran* (2008).

—Haley Cawthon

Nobelprize.org. 2014. “Shirin Ebadi—Facts.” Retrieved from http://www.nobelprize.org/nobel_prizes/peace/laureates/2003/ebadi-facts.html.

and involvement, as seen with women being credited for Rouhani's victory in the 2013 presidential election.

LGBT

In Iran, LGBT rights are nonexistent. Currently, lesbian, gay, bisexual, and transgender individuals suffer from human rights violations and are denied the basic freedom to be themselves. The Iranian government and judiciary system as well as schools, communities, and families enact this oppression. In a population of more than 80 million people, the estimated LGBT population is estimated in the millions (Haerinejad 2015). However, because of pressures and restrictions, this community is invisible and forced to prescribe to societal gender norms.

LGBT Iranians live within a very rigid societal structure that is dictated by religious and legal values implemented by the government. Every society imposes cultural norms and values; however, due to Iran's religious theocracy, these ideologies are developed based on interpretations of traditional Shia jurisprudence, preventing progressive voices from contributing to these very specific interpretations of LGBT roles in society. Iranian LGBT community members are perceived as being those who should be ostracized and removed from mainstream religious values. Efforts must be made to shift religion-based views of Muslim jurists toward inclusivity and acceptance of the LGBT community.

In Iranian culture, femininity is a preferable trait for women, as is the maintenance of gender roles. Societal acceptance heavily relies on gender roles, and most gay people in the country are forced to hide their sexuality. There is a large lack of understanding regarding sexuality and the LGBTQIA+ spectrum in Iran. Due to the stigma surrounding gay people, perceptions are often misguided and incorrect. The lack of dialogue in Iranian communities is also a challenge; thus, online correspondence among gay Iranians has skyrocketed and become an oasis for those struggling to live in a culture that does not accept them (Saul 2017). Platforms such as Yahoo chat, Instagram, and chat rooms have become critical to many Iranian youths. Finding a relationship is difficult, so youth are finding new ways to express themselves and connect, especially on dating Web sites. Iranian girls who identify as gay will use rainbows and blue hearts on Instagram to indicate their sexuality (Saul 2017).

Unfortunately, queer Iranian women feel these societal effects more harshly than men, as they often have to

deal with cultural expectations, such as seeking financial stability through marriage. Financial autonomy, societal perceptions, and the oppressive political system in Iran toward LGBT communities are substantial barriers (Saul 2017).

The concept of queer Iranian cinema may sound impossible, but it does exist. The film *Facing Mirrors* was the first movie to feature a female-to-male transgender protagonist that was written, produced, and screened in Iran (Houshyar 2013). The plot is based on the story of a friendship between Adineh, or Eddy, a pre-op trans man in Tehran who is seeking to escape his homophobic father, and Rana, a modest working-class religious woman. This film has won numerous awards and nominations in more than 60 different LGBTQ film festivals globally and has additionally received positive reviews from film critics and audiences within Iran (Houshyar 2013).

Trans people seeking transition are legally accepted in Iran. Ayatollah Khomeini issued a *fatwa* in 1978 that created a foundation for the current government's policies regarding trans issues. In present-day Iran, not only does the government recognize people in the trans community, it also financially supports them via mandating that insurance companies cover the full cost of sex reassignment surgeries as well as hormone treatment (Houshyar 2013).

Participation in Government

In 2016, 14 female candidates, all reformists, won parliamentary seats across Iran. With additional possible candidates, Iran may have its largest female delegation in parliament with 21 members (Regencia 2016). Even though women only represent a small percentage of the 290 members of parliament, many argue that these women, as well as the increasing number of reformists, are giving a voice to the female population of Iran.

Unfortunately, only 586 of the 6,229 parliament candidates in 2015, or 9.4 percent, were women, while 49 percent of Iran's population is female (Regencia 2016). Also, all female candidates nominated for the Assembly of Experts election, a council of 88 members that is tasked with choosing the nation's supreme leader, are disqualified. However, in his first two years of office, President Hassan Rouhani appointed four women as vice presidents and three as governors, though he failed to name a woman to his cabinet (Esfandiari 2015).

Feminist Movements, Organizations, and Grassroots Movements

There have been various feminist movements that have emerged to combat discriminatory laws, including the One Million Signatures movement. The status of feminism in Iran is noted to vary on the political spectrum and is often dependent on what political group holds the majority. For instance, if a more conservative president is in power, then women's rights becomes a less important issue. However, with a centrist or reformist president such as Rouhani, women's rights are currently an important component of his agenda and have become significantly more important in political dialogue than in past years.

Suffrage and Rights

Women in Iran have struggled to regain many lost rights after the 1979 revolution. During the Pahlavi era (1925–1979), women in Iran were afforded free education, and in 1963, they gained the right to vote and run for positions in parliament. Other rights included the right to petition for divorce, a minimum marriage age of 18, and gains in child custody. As of 1978, more than 2 million Iranian women were in the workforce, and 33 percent of university students were female (Esfandiari 2015).

However, many of these rights were rolled back after the 1979 election, and women were slowly shifted into traditional female careers such as teaching and nursing. Mandatory Islamic dress was implemented, and most women in decision-making positions of power were either dismissed, forced into early retirement, or demoted. Unfortunately, it was almost 10 years before a woman was named a deputy minister and more than 30 before a female minister was named within the Islamic republic (Esfandiari 2015). Women have also fruitlessly tried to run for president, but all of them were disqualified for various reasons. However, during the Iran-Iraq War, which lasted almost 8 years, women were encouraged to work as nurses, doctors, and aids for soldiers on the war front, and many of them became breadwinners for their families.

Starting in 1989, then president Akbar Hashemi Rafsanjani was known as a pragmatist on women's rights. He eased social constraints on women, which led to soaring rates of girls and women in schools and universities. Rafsanjani also encouraged family planning programs. Following Rafsanjani, President Mohammad Khatami was

even more of a proponent of women's rights. He appointed multiple women to prominent positions in his cabinet, which paved the way for many women to hold powerful jobs and careers (Esfandiari 2015). There was also a huge increase in nongovernmental organizations (NGOs), which enriched civil society. Many of these NGOs focused on women's issues.

President Mahmoud Ahmadinejad's administration is known for closing *Zanan*, Iran's leading feminist magazine, and for having a record low number of women involved in government. Ahmadinejad was also a proponent of police crackdowns on female dress code violations and an increase in birth rate, which he accomplished by cutting the excellent national birth control program in 2012. He found much opposition in women who rallied together against him during the 2009 presidential campaign (Esfandiari 2015).

Religious and Cultural Roles

After the 1979 revolution, Iran's government was framed on Islamic law. How strictly the law is enforced, however, depends on various factors. There are a lot of variances, particularly regarding dress code laws for women, that are often dependent on the political factions in power and where an individual lives.

Women's Roles

The role of women has shifted significantly in a society of more than 80 million people. Approximately more than 3 million educated Iranian women over the age of 30 are unmarried (Bengali 2016). This shift is attributed to increases in divorce and rates of attendance at universities that have led to independence in careers and incomes. In Iranian law, men are assumed to be the guardians of women, and this generational shift is huge for a theocracy that has typically supported motherhood as a woman's main purpose in life. Religious clerics are constantly promoting marriage as a part of their narrative.

Many believe that higher education is the main catalyst for this transition. When women have access to higher education, they gain higher standards. Marriage is still a powerful social norm in Iran, and laws perpetrate the higher status of men over women; however, attitudes toward the status and roles of women are slowly changing, and economic independence among women is becoming accepted.

Religious Laws

As an Islamic republic, there are rules and regulations that dictate many aspects of women's lives. As seen with many religions, texts and beliefs can be interpreted and enforced at various levels. Iran's Constitution, which was adopted in 1979, still favors men, but with high education rates for women and more visibility in important roles, there is optimism for improvement in women's rights.

The constitution adheres to sharia law, or Islamic moral code, that is based on the Koran. The constitution states, "All civil, penal, financial, economic, administrative, cultural, military, political, and other laws and regulations must be based on Islamic criteria" (Celizic 2007). There are still some abusive and archaic punishments reserved for certain offenses of the law, such as death by stoning or public lashings; however, it is important to remember that these laws are not indicative of a religion but rather the interpretations of the people who follow it.

Marriage laws in Iran are treated like contracts, which create rights between the contracting parties. For the contracts to be valid, they require an offer and acceptance to marry and must include a provision for the *mehrieh*. The law specific to marriage and divorce states that "husband and wife are bound to establish friendly relations," and they "must cooperate with each other for the welfare of their family and the education of their children" (Sawma 2014). However, Article 1105 of the Constitution states that "the position of the head of the family is the exclusive right of the husband" (Sawma 2014).

Iranian women are required to dress modestly and wear a *hijab*, or headscarf. There are many different interpretations within Islam regarding the importance of the hijab, and throughout Western media it has often become a symbol of oppression. There are many women in Iran who would rather not wear a hijab in public, but there are also many who do and who wear it passionately. This is often seen by the various types of hijab in the streets of the city. Sometimes they are worn as a loose shawl where most hair is seen, or sometimes they are a black *chador*, which covers the entire body except for the hands and face.

Iranian women, however, hold rights in many everyday aspects of life. Women freely drive in Iran, make up the majority of university students, and hold public office. In fact, women seemingly hold any profession they want. In Tehran, there is professional firefighting fleet composed entirely of women who wear hijabs under their helmets while responding to fire calls (Celizic 2007).

According to Massoumeh Ebtekar, the first woman to serve as a cabinet secretary in Iran, the role of women is improving (Celizic 2007). However, she believes that first Westerners need to abandon their obsession with hijab, claiming that there are more important issues to focus on in the country pertaining to the status of women's rights. Ebtekar acknowledges that there are difficulties in regard to sharia within the law, but she argues that interpretations of the law often evolve. Recently, there have been more reinterpretations of Islam in favor of women. Also, with the rising number of female parliamentarians in the country, there has been an influx of effort in passing laws more in favor of women. A recent example is a law stating that if a man unjustly divorces his wife, the wife is entitled to half of his wealth (Celizic 2007).

Issues

Domestic Violence

Violence in Iran against women varies significantly from province to province. In Mazandaran Province, 93.6 percent of pregnant women have experienced violence versus 17.5 percent of pregnant women in Khorasan Razavi Province (Joulai 2016). There is a high prevalence of violence against Iranian women, primarily in families. Studies have also indicated that increasing violence is linked to rising age in women. There is also an inverse relationship between educational attainment and the prevalence of violence (Joulai 2016). Additionally, the prevalence of violence is significantly less among working women than housewives.

Trafficking and Prostitution

Iran is a source, transit, and destination for sex trafficking. Iranian girls between the ages of 13 and 17 are targeted by traffickers for sale abroad, and younger girls are often forced into domestic service until they are old enough to be trafficked. From 2009 to 2015, a significant increase in the transport of girls from and through Iran for sexual exploitation to other Gulf States has been documented (U.S. Department of State 2016). However, specific and accurate information regarding human trafficking in Iran is nearly impossible to obtain. Often, Iranian trafficking networks transport Iranian girls via brothels in the Iraqi Kurdistan Region of western Iran. Even regional government officials of Kurdistan were listed as clientele of these brothels, according to media reports (U.S. Department of State 2016).

In areas such as Tehran, Tabriz, and Astara, the exploitation of teenage girls in sex trafficking keeps rising, and organized criminal groups often either kidnap or purchase Iranian and immigrant children and force them to work as beggars and street vendors in the city (U.S. Department of State 2016). This is a very common occurrence, especially in Tehran, where children can be purchased for as little as USD\$150 (U.S. Department of State 2016). These children, sometimes as young as the age of three, are forced via physical and sexual abuse as well as drug addiction.

According to the Iranian government, the majority of sex workers are married, and 11 percent reported that they work with the knowledge of their spouse (Vick 2016). Prostitution in Iran primarily serves as a means of income in a country that is plagued by financial instability due to sanctions as well as an incredibly high rate of opium addiction. Prostitutes in today's Iran are younger than ever and are in this position because of their desperation; they see no other means to support themselves (Vick 2016).

Beauty and Cosmetic Surgery

Iran recently became one of the top 10 countries for the number of cosmetic surgeries performed, and in 2013, it ranked fourth in the world after Brazil, Mexico, and the United States for nose jobs (*The National* 2016). The most common procedure in Iran is the nose jobs; eyebrow tattoos and liposuction are also popular.

Approximately 200,000 cosmetic surgeries occur in Iran on an annual basis, with more than 60 percent of these procedures being nose jobs. Walking through the streets of any large Iranian city, especially Tehran, it is easy to identify not only women, but men, who have just had a nose job by the bandages on their noses, flaunting the fact that they had a nose job. Having a nose job has become a means of showcasing one's position in society and the ability to afford improving one's beauty. The cost of a nose job begins at USD \$1,500, which is more than five times the minimum Iranian monthly salary of USD\$270 (*The National* 2016).

For many, cosmetic surgery has become a means of resisting and reacting to the rules of compulsory hijab wearing in Iran, as the women are forced to display their "art" on their faces. Others have also identified television as being a part of this cosmetic surgery craze. Popular television shows from countries such as Turkey are streamed into homes via banned satellite dishes and often portray

beautiful actresses that have helped various perpetuations of beauty in Iran. The channels on which these shows are broadcast to a huge chunk of the population also broadcast commercials for nose jobs, weight-loss creams, and waist trainers. There is also a significant number of travelers who fly in from other countries, such as Iraq and Azerbaijan, to have plastic surgery in Iran, as prices are relatively low compared to the rest of the world (*The National* 2016). Many clients are also Iranians who live abroad in other countries, such as the United States and European nations.

Iraq

Overview of Country

Iraq is a country located in Southwest Asia. It covers 168.87 square miles of land and 366.80 square miles of water. Iran, Jordan, Kuwait, Saudi Arabia, Syria, and Turkey surround it. The capital of Iraq is Baghdad, and the official languages are Arabic and Kurdish. The population of Iraq is approximately 32,585,692 people, which consists of Arabs (75%–80%); Kurds (15%–20%); and Turcomans, Assyrians, or others (5%). The majority of the population (97%) are Muslims. Iraqi Muslims mainly belong to one of the two major branches of Islam, Shia (60%–65%) or Sunni (32%–37%). The remaining Iraqis are Christian, Yazidi, Mandaean, and Jewish (CIA 2017).

Iraq became independent from Great Britain in 1932. The Hashemite monarchy ruled the Kingdom of Iraq until 1953, when they were overthrown by a military coup. The Baath Party gained power in a bloodless coup in 1968 by Ahmed Hassan al-Bakr, who was a leading member of the revolutionary Arab Socialist Baath Party. At the time,

Saddam Hussein, another leading member of the Baath Party became al-Bakr's vice president. Saddam Hussein, with all the power and support that he had gained in the Baath Party, forced al-Bakr to resign and became the official president of Iraq in 1979. He was the president of Iraq until 2003, when he was overthrown by the U.S.-led invasion of Iraq.

Iraqis have witnessed four wars in the past few decades: the Iran-Iraq War (1980–1988); the Anti-Kurdish Conflict (1986–1989); the Iraq-Kuwait War (or First Persian Gulf War, 1990–1991); and the U.S.-led Iraq War (or Second Persian Gulf War, 2003–2011). It now faces internal attacks from the Islamic State (IS), or the Islamic State in Iraq and Syria (ISIS), which increasingly targets civilians in Iraq and the surrounding countries. The civil war in Syria is deeply felt in Iraq, especially in the number of refugees who flee to the already devastated Iraq. In addition to the wars, Iraqis also suffered from UN-imposed sanctions for 13 years (1990–2003).

Years of war and sanctions have not only corrupted Iraq's military and economic systems, but they have also left deep impacts on Iraqi society. Iraqi women dealt with acute unresolved problems after the wars. For example, because many Iraqi men were called to fight during the wars, the women became the heads of many families. As the main caregivers, mothers were responsible for keeping their children fed and safe; in many cases, this resulted in not paying attention to their own health and well-being. Another issue was the fact that the militarization of society leads to more violence, and the group that is most often affected by this violence is women. Violent deaths attributed to sources other than the coalition jumped from 1 percent of all deaths in Iraq before the invasion to 19 percent between June 2005 and June 2006 (Burnham et al. 2006).

The first journal that dealt with Iraqi women's rights, *Leila*, was published in 1920, but the most progress toward the democratization of Iraqi women's condition started after the 1960s. In 1970, under the power of the Baath Party, the Iraqi Constitution became more favorable to women. Article 19 guaranteed equal opportunities for all citizens within the limits of the law, and women gained more rights, especially in the areas of education and employment. The General Federation of Iraqi Women (GFIW) was established by the Baath Party to implement state policy. However, many Iraqi women thought this governmental organization did not accurately represent them or their particular struggles.

Iraqi women had years of success in claiming their rights, and years of being pushed back as wars and sanctions advanced more patriarchal traditions. As Neshat asserts, "Women were the real victims of war and sanctions. The worse economic situation affected on their health and educational needs" (2003, 57). Al-Ali and Pratt note, "There are many signs that Iraqi women might prove to be biggest losers in post-Saddam Iraq. Iraqi women are struggling more than ever in their day-to-day lives, trying to keep their households going, feed their families and keep everyone alive" (2006, 21). Although struggling with many basic concerns, women do not passively witness what happens to them; they also act. After the recent war, many Iraqi women came together to rebuild their country and try to get their voices heard.

Education

Education has been public and free in Iraq since 1970. Although education is mandatory at the elementary level (six years), only 73.6 percent of females and 88.4 percent of males in Iraq are literate. The lowest rate of school enrollment is among rural girls who are 6–11 years of age, 70.1 percent (CIA 2017). Traditionally, boys' education is preferred over girls' education because they are supposed to be the main breadwinners of the house. The wars and conflicts have affected students' ability to access education. Twenty percent, or 1 million children, are not in school, and 3 million children are living in areas under IS control (UNFPA 2015).

Besides the violence in the public sphere, which prevented girls from going to school, there were also economic constraints for Iraqi families, often the result of wars and sanctions. Some Iraqi families, especially in rural areas, could not afford to send all of their children to school. It was usually the girls who were kept at home when families faced economic deficiencies. Only 82 percent of girls enrolled in primary school, compared to 93 percent of boys. Also, the school dropout rates for girls are much higher than for boys (UNICEF 2017). Secondary school attendance drops significantly for both boys and girls; only 44.6 percent of girls and 52.5 percent of boys attend past their primary years. Another factor affecting school attendance is adolescent marriage; 20 percent of girls are married, and early marriages are on the rise (White 2015).

In addition to this, female students describe the school environment as "unwelcoming, unpleasant, dirty, and

poorly maintained with filthy lavatories and no drinking water” (von Sponeck 2011). This situation affects girls’ physical and emotional health and works as an additional barrier to their education. In the long run, this suspension of access to education will result in a less educated population and fewer equal job opportunities for Iraqi women compared to Iraqi men.

Decades of war and violence have turned Iraqi children, both girls and boys, into victims of human rights violations. Around 3.5 million Iraqi children are living in poverty, and millions of them are undernourished. Thirty-seven percent of the population is under the age of 14, or 12 million children. The median age is 21 years, and 6 percent of the population is food insecure (UNICEF 2017).

Health

Access to Health Care

Iraq spent 5.5 percent of its gross domestic product (GDP) on health care in 2014, and with the ongoing military conflicts, internally displaced Iraqis, and increasing numbers of refugees fleeing the Syrian civil war, there is a dire situation for health care and supplies in the country (WHO 2015). Current numbers are often difficult to find, even by international organizations dedicated to assisting the humanitarian crisis in Iraq. Civilians have increasingly been targeted, and medical facilities have been intentionally destroyed.

Life expectancy at birth is 73 years for women and 66 years for men (World Bank 2014). Sixty-nine percent of the population lives in urban areas, but increasing numbers of Iraqis are internally displaced; this impacts people’s access to health care. In 2010, there was less than 1 doctor per 1,000 people, and a lack of female medical staff is a concern for Iraqi citizens, especially women (CIA 2017; White 2015).

Though improved drinking water is available to 84.9 percent of the population, interrupted service due to conflict and bombings is common (UNICEF 2017; WHO 2015).

Eight percent of women have undergone female genital cutting (FGC), or female genital mutilation (FGM; UNICEF 2017).

Maternal Health

More than 53 percent of women in Iraq use some form of contraception, but one-third of family planning

institutions have been destroyed since 2003. Women living in rural areas are even less likely to be able to access family planning services (WHO 2015; White 2015). The fertility rate in 2013 was 4, which is high for the region (WHO 2015). The more education and opportunities women have access to, the lower the fertility rates. There is also a correlation between the number of children and levels of gender-based violence; the more children in a family, the higher the likelihood of violence against women and girls in the family (White 2015).

The maternal mortality rate was 67 per 100,000 in 2013, but 35 percent of pregnant women are anemic (WHO 2015). More than 50 percent of women attend four or more antenatal appointments, and 91 percent are attended by a skilled birth assistant for delivery; 2007 was the last year these data were available (WHO 2015). It is expected that these numbers are much reduced due to the ongoing military and refugee crisis in the country. The mortality rate for children under five years old is 34 per 1,000 children, but 21 percent of children who die were born premature, an occurrence that increases when maternity health care is poor (White 2015). Neonatal mortality is the cause of the majority of child deaths in Iraq, 20 per 1,000 in 2011 (UNICEF). Only 19 percent of babies are exclusively breastfed (UNICEF 2017).

Abortion is prohibited except to save the life of a woman or in the case of fetal abnormality. Unsafe abortions are dangerous and can contribute to lasting health issues for women.

Diseases and Disorders

In 2007, 63 percent of children received the measles vaccine, but more recent data is not available (WHO 2015). Disease rates are increasing in refugee camps, including a cholera outbreak, and 22 polio cases were reported in 2013 (UNICEF 2017). Heart disease is the leading cause of death, killing 27,000 in 2012 (WHO 2015). HIV rates are very low, and malaria is uncommon.

There are many reports on epidemic cancer and birth defects in Iraq linked to war. “High rates of miscarriage, toxic levels of lead and mercury contamination and spiraling numbers of birth defects ranging from congenital heart defects to brain dysfunctions and malformed limbs have been recorded” (Morrison 2012). Due to the lack of documentation and reporting, there are no accurate statistics available on war-related health issues. Although there are official statistics by the Iraqi government, the actual

numbers are likely to be much higher. As an example of increasing cancer cases in Iraq, official reports from the Iraqi government show that before the First Persian Gulf War (1991), the cancer rate among Iraqis was 0.04 percent. In 1995, the cancer rate was 20 times higher than 1991. By the year 2005, the cancer rate among Iraqis was 1.6 percent, and current estimates show the trend is increasing (Jamail 2013).

Employment

Due to years of women's organized campaigning to access education and jobs, women have gained acceptable shares in the workplace. But rising insecurity after the U.S. invasion resulted in families not allowing their children, especially girls, to go to school. The same thing happened for women; they were forbidden to appear in public to prevent any possible assault. Although many women were educated and had their own jobs, the streets and public sphere no longer felt safe; many preferred (or were compelled) to stay at home and out of danger.

One of the issues that had a major effect on Iraqi women was mass unemployment as a result of sanctions and economic crises during and after the wars. Many men had been killed in the wars, which meant there were more women heading families and serving as the main breadwinners. Before the sanctions and economic crises after these wars, Iraqi women had their own jobs and good salaries. But due to rising unemployment, they were the first group pushed back into their homes so that men could take the jobs, and it was Muslim people who filled most of those jobs. Widows in particular experienced challenging times in taking care of their children under these economic difficulties.

Another issue under the Baath regime was that many people had to become members of the Baath Party to gain better job opportunities. After the de-Baathification of Iraq (removing the Baath Party's influence on Iraq), many people lost their jobs because they were members of the Baath Party. Among them there were many female teachers who had to join the Baath Party to have better opportunities and to get jobs in the male-dominated job market in Iraq. After the fall of the Baath regime, the level of insecurity and unemployment in Iraq sharply increased. Based on the latest survey, 86.7 percent of Iraqi women are not employed (WHO 2007), and up to 24 percent of 15- to 29-year-olds are unemployed (UNICEF 2017).

Family Life

Although it is becoming less common, arranged marriage is the most common form of marriage in Iraq. The mean age at marriage is 23 for women and 28 for men (UNICEF 2011). After marriage, couples generally start their new family in one of two ways. One is living with extended family in a room of a house where other families live, each family living in a different room. Or they can have their own independent house. On average, there are 6.4 persons per household in Iraq (WHO 2007).

The way they choose to live depends on family tradition and their socioeconomic status. Sometimes couples cannot afford to live independently or they prefer to stay with extended family. When the nuclear family forms and the couple separates from extended family, women do not have the chance to share child-rearing and household duties with other members of the family. Polygamy became common after the Iran-Iraq War because of the number of men killed in the war. Men were encouraged to marry more than one wife and take on the responsibility of more families.

The number of divorce cases has been increasing since 2003 (Sadah 2013). Researchers point to the rise of violence and serious sociopolitical disruption after the U.S.-led invasion as the main reasons for the increase. Although the number of divorced women is increasing in Iraq, society is still not accepting of this phenomenon. Divorced women often experience sexual harassment and become isolated from the society.

Domestic violence experienced by women in Iraq is disheartening. Forty-six percent of girls aged 10–14 have witnessed violence committed by a family member, and 56 percent of women believe a husband is justified in beating his wife. A staggering 68 percent of men condone and would commit an honor killing of a female family member.

Politics

Based on Article 1 of the Iraqi Constitution of 2005, Islamic law is the main source of the country's legislation. This article also states, "This Constitution guarantees the Islamic identity of the majority of the Iraqi people and guarantees the full religious rights of all individuals to freedom of religious belief and practice such as Christians, Yazedis, and Mandi Sabeans."

Both men and women can file for divorce, although the process is easier for men than women. In the case of divorce, the right to custody of the child goes to the mother until the age of 10 and can be extended to age 15 if it is in

the interest of the child. After the age of 15, the child can decide whether she or he wants to stay with the mother or the father.

Based on Iraq's 1956 personal status code, a woman's share of an inheritance was equal to that of a man. But with recent changes in the law, which is based on a specific interpretation of Islamic law, a woman now only inherits half the share that a man inherits.

Before the 2003 invasion, Iraqi women could easily leave the country at will. But an amendment was added to the law in 2004 that indicates that a woman should have permission from her male guardian to be able to leave the country.

Participation in Government

In the Arab world, Iraq was the first country that had elected a woman to a parliamentary position. Iraqi women gained their right to vote and run for political office in 1980. Based on the 2005 Constitution, Article 47, one-quarter of the Council of Representatives should be women. Iraqi women currently have 83 out of 328 seats in the Iraqi parliament (IPU). Article 20 of 2005 Iraqi Constitution states, "The citizens, men and women, have the right to participate in public affairs and to enjoy political rights including the right to vote, to elect and to nominate."

Religious and Cultural Roles

Religious and cultural roles are so interwoven in Iraqi society that separating one from the other is nearly impossible. The Baath Party was a secular party and in favor of separating religion and state. After the de-Baathification of Iraq, Islamic extremists gained power in Iraq, and more restrictions were put on Iraqi women. However, Iraqi women, like all other Muslim women, can add conditions to their marriage contracts. In Iraq, women keep their own last name after marriage, and they can claim the right of custody, divorce, and the like in their marriage contracts. But many cultural expectations in Iraq are based on a patriarchal interpretation of the Koran.

In patriarchal Iraqi society, women are generally expected to take care of most of the household chores, even if they are working or studying outside of the house. Iraqi women spend an average of four hours a day doing household chores (preparing food, cleaning, caring for children, etc.) compared to the 28 minutes that men spend (Sandrasagra 2007). Women are expected to take care of

the children, and they spend the most time with them; fathers are expected to be the breadwinners.

Issues

Violence against Women after 2003 U.S.-led Invasion

Lasky (2006) and Sandrasagra (2007) argue that during the Saddam Hussein regime, Iraqi women faced violence too, but at least there were some strict laws to protect women. As noted by Al-Ali (2006), a general state of anarchy and chaos is endemic in postwar situations, which exacerbates constructions of masculinity promoted during conflict. After Saddam Hussein's regime, and during the war, Iraq's judicial system was destroyed, and that led to a lack of law and order. With the gap in security, each group of people wanted to enforce laws that supported their beliefs (e.g., Shia vs. Sunni, liberals vs. conservatives, etc.), and this caused a lot of insecurity and chaos. Some scholars see the lack of "properly functioning police forces" as a major reason for most of the insecurity and fear Iraqi women encountered in the public sphere (Ali-Ali and Pratt 2006). As chaos reigns in the public sphere, it increasingly becomes a space that women attempt to avoid at any cost. Consequently, their activities are confined to the private domain and the shielded security of their own homes.

Kidnapping

Kidnapping, which was very rare before the invasion, became a main source of fear for women in public spaces. Kidnapping is also the primary concern that inhibits the mobilization of Iraqi women in the public sphere. Kidnapping is a socially sensitive issue in a traditional patriarchal society, so there are few official statistics on the topic.

Street Harassment and Forced Hijab

One of the results of the U.S.-led invasion of Iraq was that Islamic extremists, which had been kept under control by Saddam Hussein, came to power. One of the justifications for the "War on Terror" was "liberating" women in those countries, but after the invasion, more fundamentalists gained power in Iraq and placed more restrictions on women. In 2011, the U.S. Department of State estimated that there were 1,000 to 2,000 Al Qaeda members in Iraq. They are the largest Sunni extremist group in Iraq and are mainly located in Baghdad, Fallujah, and Najaf (2010).

Women became targets of street harassment by Al Qaeda for not covering their hair and bodies. They were harassed on the streets and forced to cover themselves. Religious conservatism became another justification for violence against women. Forcing women to wear what she is not voluntarily willing to is a form of gender-based violence. Islamic extremists, who were empowered after the invasion, put many such restrictions on Iraqi women's mobility in the public sphere.

Honor Killing

Iraq witnessed a huge rise in honor killings during the war for several different reasons. The U.S.-led invasion and Saddam Hussein's fall destroyed Iraq's judicial system, and in many families, male family members decided to take over its functions. Among the causes of honor killings were the arrests of women by U.S. military police. The U.S. military used imprisoned Iraqi women as bargaining chips to make men confess. Such stories led Iraqi families to feel dishonored by their female family members after their arrests. It was possible that these women had been victims of sexual abuse or rape in prison, and these experiences are rarely reported. So, whether the woman was raped or not, if her family felt dishonored, they would sometimes kill that female family member.

On the other hand, blaming the victim is common in patriarchal societies, and the threat of an honor killing forces Iraqi women, especially in rural areas, to hide sexual abuse they have faced and not report it to protect their lives. The penalty for honor killing is not severe enough to prevent it. According to Article 409 of the Penal Code, a person who kills his relative based on the intention of honor killing receives as little as six months to three years in prison.

Different Areas in Iraq, Different Issues

Iraq is a diverse country with different issues for different groups of people. For example, the north of Iraq, Kurdistan, was a safe place before, during, and after the war. In 1991, following the First Persian Gulf War, Kurdistan gained its de facto autonomy and became self-ruled. So, Iraqi Kurds did not suffer as much from the war, and they were far from the main conflicts. Iraqi women in Kurdistan are progressing in many ways, especially after the fall of Saddam Hussein. As Lasky and Al-Ali note, as a result of the women's movement in Kurdistan, "More women's

centers have opened, [and] Kurdish women have held positions in the interim Iraqi governments" (2006, 6). Aside from regional differences, religion, class, and race are other factors that warrant further study.

Poverty and Female-Headed Households

Female-headed households have steadily become an issue in postwar Iraq. The International Committee of the Red Cross (ICRC) estimates that 1–2 million households in Iraq are headed by women (ICRC 2011). These women mainly became the heads of their families after their husbands were killed, missing, or detained. There was a huge increase in the number of Iraqi widows as a result of the war. In Iraq's patriarchal culture, men are responsible for financially supporting and providing for their families. With the death of her husband, a woman is left in the precarious situation of becoming the sole provider and caretaker of her family. There are many women on Iraq's streets begging for money or willing to do any job they can do to get food for their children. The dire situation that Iraqi women find themselves in leads them to prematurely terminate their children's educational trajectory and directs them to find material resources urgently needed for their families' survival. Although education is free in Iraq at all levels, these families cannot afford to buy school supplies or clothing for their children to be able to stay in school. This is a dramatically different situation than what families encountered before the U.S.-led invasion.

Iraqi Refugees

The Iraq War resulted in the large-scale displacement of Iraqis. One out of every two displaced Iraqis are children; 0.3 million are currently internally displaced and living in refugee camps, and 2.9 million are displaced and living outside of camps. In 2014, 2.12 million Iraqis were displaced from their homes, and 85 percent were in debt. In 2015, 3.2 million were displaced, and only 400,000 have been able to return (UNFPA 2015).

Iraqis decided to leave their country because of the numerous problems they were facing; they hoped for a better future for their families. But the life that was waiting for them was not as bright as they had assumed. There is high unemployment among Iraqi refugees; many of them were specialists in Iraq, but they often have trouble finding a job in their field in the country of resettlement. They have to accept any job, regardless of their background and

areas of specialty, to survive. The number of Iraqi refugees was around 300,000 in February 2009, and there are many more unregistered refugees; estimates show there are likely around 1 million refugees in total.

After all of the disasters Iraqi refugees have faced as a consequence of war, the United States is trying to take steps to help Iraqi refugees. Like refugees from other war-torn countries, Iraqi refugees arriving to the United States have significant health issues, including mental and physical trauma. Iraqi women refugees face increasing violence, including domestic violence.

Syrian Refugees

Iraq has absorbed an incredible number of the refugees fleeing the civil war in Syria. In addition to the 1 million displaced Iraqi citizens living in the Kurdistan region of Iraq, 250,000 Syrians are now residing in numerous camps there as well. In 2013, 60,000 Syrian refugees fled to Iraq in August and September alone, making it the highest number since 2008 (UNFPA 2015).

Israel

Country Overview

The modern state of Israel, established in 1948 by the ending of the British Mandate for Palestine, has a complicated and tumultuous short history. Following the refusal by Arab nations of a UN-proposed two-state partition of the region, the State of Israel was declared and promptly embroiled in a series of wars with neighboring states. With extensive international support from the West, Israel expanded its territory and deepened tensions between sides. Through a series of treaties over the last four decades Israel has withdrawn from some areas and expanded into others—situations complicated by some Jewish settlers

refusing to acknowledge the government's authority to remove them from disputed areas and the government showing a preference for expanding Jewish settlements over supporting existing Arab towns. The resulting violence, military occupation, and oppression of communities have made lasting peace difficult.

Israel is situated on the Mediterranean and Red Seas and shares borders with Syria, Lebanon, Jordan, Egypt, the Palestinian Territories of the West Bank, and the Gaza Strip. The climate and topography are varied: coastal areas with hot summers and cool wet winters, arid desert, fertile valleys, mountainous areas in the north, and the Jordan (River) Rift Valley, which forms the eastern border of the country. Population estimates for 2016 range from approximately 8 million to 8.6 million. This variation is due to different recognitions of its borders, as the State of Israel claims areas of the region that are not internationally recognized (CIA 2016). Israeli citizenship is granted in a variety of ways, including the Law of Return, by which all Jews, as well as their spouses and children, are granted the right to immigrate to Israel. There are various legal definitions incumbent on emigrants, but those who qualify are granted nearly automatic Israeli citizenship after three months of residence. Instituted as a response to government expulsion and extermination policies of the 19th and 20th centuries (including the *Shoah* (Holocaust) and pogroms in Russia and other European countries), the intent was to allow at-risk Jews the ability to emigrate as needed. However, critics of the law argue that the ethnic distinction of "Jewish" is discriminatory in that it does not include the right for Palestinian descendants of the land to return with guaranteed citizenship.

Demographics

Population estimates for 2015 found nearly 75 percent of the population identify ethnically as Jewish (Israel-born 75.6%, Europe/America/Oceania-born 16.6%, Africa-born 4.9%, Asia-born 2.9%), with the remaining 25 percent of the population predominately identifying as Arab. Religious affiliation is similarly weighted: Jewish 74.8 percent, Muslim 17.6 percent, Christian 2 percent, Druze 1.6 percent, and other 4 percent. Throughout this entry, we will be referring to the Haredi, commonly referred to as the Ultra-Orthodox, which are a sect of highly conservative Jews that make up approximately 11 percent of the population.

The population is predominately urban (92%) and generally has access to advanced sanitation and improved

drinking water (CIA 2016). However, because of the complexity of the social and political situations in the area, it is difficult to definitively discuss issues pertaining to all individuals living in the country, particularly because much of the data is collected on "recognized" towns. The government's refusal to recognize Arab towns, especially in the Negev desert, has left 100,000 Israeli citizens of Arab descent without services, including water and electric, education, road and infrastructure maintenance, and so forth. The 2015 UN *Human Development Report* ranks Israel as 18th globally with a steady Human Development Index (HDI) of 0.894, placing it in the "very high human development" listing (UNDP 2015). As such, Israel has an even sex ratio, broad access to education, high levels of literacy, low maternal and infant mortality rates, and life expectancy into the 80s.

Girls and Teens

A 2016 UNICEF report found that Israel has one of the highest levels of income inequality among children in high-income nations, meaning that the poorest children fall further behind middle-income peers in measures that include health (where Israel ranked last), literacy, income, and life satisfaction (UNICEF 2016).

Military Service

Israel is one of the few countries that has compulsory military service for both men and women (other countries include Cuba, Norway, Tunisia, Eritrea, and North Korea), and women have been serving in the Israeli Defense Forces (IDF) since their inception. Women, generally beginning at age 18, serve 24 months, unless they select a specialty with required longer service. The Equality Amendment to the Military Service Law states that women have equal rights to serve in any capacity as men, although individuals must be found physically and mentally suitable. Approximately 90 percent of the positions in the IDF are open to female candidates, and women can be found in nearly 70 percent of those. Sixty-five percent of Israeli women are exempted from compulsory service, which includes women who arrive in Israel after the age of 17: 25 percent opt out of service on religious grounds, and the remainder are exempted for a variety of reasons, including marriage, pregnancy, or physical or emotional reasons (Bloom 1991). In 2013, the IDF allowed the first male-to-female transgender soldier to serve as a female soldier.

Women in Black

In Jerusalem, in 1988, a group of Israeli women dressed in black stood in public places to demand an end to the occupation of Palestine. Palestinian women soon joined the Israeli women, and the Women in Black movement was born. Similar to other vigils and movements by women in public spaces, such as the Madres de la Plaza de Mayo in Argentina, Women in Black uses a traditional mourning color and the physical presence of women's bodies to call for an end to war, an end to violence, and a renewed valuing of women's voices.

The movement spread quickly around the globe, and there are many vigils held weekly, especially during times of increased violence, such as the beginning of war in former Yugoslavia in 1991 and the bombing of Iraq in 2002. In many countries, the vigils are silent; in others, the women walk silently or use masks. The women are often targets of harassment and threatened violence.

Refusing the logic of war is central to the women who stand weekly with their sisters. Women in Black recognizes that women experience particular realities because of their gender and that the violence many women experience at home is related to the violence of war. In 2000, the NGO International Alert and the UN agency UNIFEM awarded Women in Black the Millennium Women's Peace Prize, and in 2001, the network was a nominee for the Nobel Peace Prize.

—Kryn Freehling-Burton

Education

Israel has compulsory education from ages 5 to 17 for both girls and boys with a variety of tracks: state-secular, state-religious, independent-religious (Haredi), and Arab-focused (taught in Arabic with a focus on Arab history and culture). Education is highly valued and an important part of both the Israeli culture and economy. While enrollment and literacy rates are even between the sexes (both with very high literacy), illiteracy among older women in particular is noticeably higher.

Primary and Secondary Education

Enrollment in some form of primary and secondary education nears 100 percent of eligible children, with girls enrolled at slightly higher rates throughout. Girls have a lower dropout rate and a significantly higher pass rate for high school matriculation exams—possibly due to higher enrollment of males in religious schools over traditional education.

Postsecondary Education

Women in Israel outnumber men in postsecondary education, women being 57 percent of undergraduates, 59 percent of master's level, and 52 percent of PhD-level candidates—numbers that are similar for both Jewish and Arab women. A variety of factors play into that, including compulsory military service and low matriculation rates among the Ultra-Orthodox. However, while female students significantly outnumber males, the vast majority of professors at the university level are men. Additionally, high-status fields, particularly STEM fields, are dominated by men (UNESCO 2015).

Health

Access to Health Care

Israel has a national health care system that legally entitles Israeli residents to a variety of health care services, including reproductive health care, that is determined yearly in accordance with the budget. Israel spends 7.8 percent of its gross domestic product (GDP) on health care, with an average of three physicians and 3.5 hospital beds per 1,000 people. However, as with other issues, equitable distribution and issues of access are not reflected in those numbers. Life expectancy is even between sexes, with an average life span of 83 years (WHO 2015).

As in many countries, ethnicity, socioeconomic status, and where you live affects your access to health care, and the poorest and most marginalized members of society are the least able to access services. The Haredi, Arab Israelis, and single-parent households all have less access to health care and shorter life expectancies.

Maternal Health

Maternal and infant mortality, understood to be an indicator of a country's development, are both quite low, with 5 maternal and 3 infant deaths per 1,000 (WHO 2015).

The population growth is higher than other high-income nations, averaging around 3 births per woman, and Israeli women also have a lower age at first birth, 27 (OECD 2016). These numbers are understood to be due to the cultural and religious preferences for younger and larger families in several groups. Urban women have broad access to prenatal care, and the majority birth in a hospital. As part of the national health program, pregnant women are entitled to prenatal care; termination of pregnancy for medical reasons, as well as for nonmedical reasons in the case of girls under 19 years of age; fetal organ system exams (ultrasounds); epidurals during birth; and genetic testing.

While Israel's maternal health numbers are good, there are troubling findings as to the treatment of minority Arab women in hospitals. Many antenatal wards are segregated into Jewish and Arab areas, and while that may allow for different cultural practices, the segregation is based more in fear and suspicion. Studies have found Arab women, though birthing in the same facilities as Jewish women, reported a much higher level of fear and loss of control during labor and birth, that they were concerned for the safety of their newborns, and that the level of medical intervention was much higher than they felt necessary. All of these indicate a medical system in which their concerns and experiences are not prioritized.

Access to Mammography and Contraception

Israel has a pronatalist approach to reproductive health, and, as noted above, has one of the highest birth rates within high-income nations. However, while a cultural preference for large families exists, both secular and religious law (both Jewish and Muslim) are broadly accepting of contraception, assisted reproduction, and abortion. Women are entitled to access contraception under the national health care law, although it is not always covered. Emergency contraception is available over the counter, although it must be requested from a pharmacist. It can also be partially refunded through the national health care system. Annual mammography is covered for postmenopausal women, as is abortion in a variety of cases.

Access to Abortion

Despite its pronatal culture, abortion in Israel is legal and accessible. Officially, any termination of pregnancy must be approved by a committee, but in practice, approval is widely granted. Abortions for women under the age of 19

and for fetal unviability are covered under the national health care system.

Diseases and Disorders

While rates of infectious diseases, including HIV, are low, concerns over childhood nutrition and obesity are becoming issues for government health services. A rising number of affluent children are measuring as overweight, and Bedouin and Haredi children, generally the poorest segments of society, show signs of low nutrition and food insecurity as measured by size and weight.

Because Israel has a modern health care system, there has been discussion as to the role of Israeli hospitals in regard to Israel's neighboring countries, particularly as civil war in Syria has decimated that country's hospitals. Treatment of the ill and wounded, particularly women and children, is a serious issue that has yet to find balance between humanitarian need and isolationist security concerns.

Employment

Israel has one of the lowest levels of participation in paid labor among high-income nations, meaning that the Israeli economy is particularly troubled. Only about 65 percent, or two-thirds, of eligible adults are members of the workforce. When one accounts for mandatory military service, the numbers look a bit better, but Israel is hampered by populations not entering the workforce—most specifically Haredi men and Arab women. Women's employment in Israel, like most nations, varies among demographic groups, but women are in many ways the driving force of the working economy. Officially, gender discrimination in hiring and wage determination is illegal, but in practice, there are significant disparities: Israeli women average 68 percent of what their male colleagues make (which would be USD\$0.68 to the male USD\$1), a number that would be significantly worse for some women (Elis 2015).

Participation in the Workforce

Israeli women in general have high participation in paid labor, and their participation raises the national average after military service to just over 75 percent, on par with other high-income nations. The lowest participation rates in the traditional economy are Arab women, at around 28 percent, and Haredi men, at 48 percent. These numbers are contrasted with nearly 67 percent of Haredi women and

almost 80 percent of secular Jewish women; this makes them one of the highest groups in the world for labor force participation (Arlosoroff 2012). Particularly among Haredi women who are responsible for the majority of family and household duties, the burden of the “double shift” of paid and unpaid home labor is onerous. This highlights where families, and particularly woman-headed households, are most likely to be poor and is a concern among secular Jews in the country that Haredi men are subsidized by the state (in the form of welfare benefits) to focus on religious study rather than economic participation.

Poverty Rates

Like most countries, women, particularly women-headed households and elderly women, are more likely to live in poverty. Actual numbers on poverty rates are difficult to state clearly, as the World Bank estimates that Israel has one of the largest underground economies in the world. Women’s participation in underground or cash economies as household help, child care providers, and through the selling of household goods tends to be high. Israel’s cost of living is very high, and dual incomes are generally necessary to maintain a middle-class standard of living.

Family Life

Family is highly stressed in Israeli culture, particularly among the more traditional religious groups, and is viewed as the basis for the survival of culture and community. Particularly as the world’s Jews exist in a diaspora after millennia of persecution, expulsion, and genocide, and as Jews are a very small population globally, family is considered by many to be central to the survival of the Jewish people. In fact, there have been times in Israel’s history that government agencies have been devoted to the promotion of large families. However, this attitude is not exclusive to Jews; many of the cultures of the Mediterranean and Middle East, from Italy and Greece to the Arab world, consider family to be the basic unit of society. In these patriarchal societies, the mother becomes the focal point around which family is centered. While this role can give women great satisfaction and power in the private sphere, societies in which motherhood is the primary function of women can be particularly limiting to women who are unable or choose not to have children. The idea that women are destined by their biology to fulfill certain functions—functions that have traditionally been defined

as subservient to men—is limiting. While not all individuals hold the same beliefs, the cultural norms and expectations for women can be difficult to escape.

Marriage and Divorce

The official legal age for marriage in Israel is 18, although in Israel, laws pertaining to marriage and divorce are exclusively the purview of religious courts that have near total authority to act. Jewish, Muslim, and Christian sects each maintain jurisdiction over civil matters, and gender discrimination within them is rampant. Women are not allowed to be judges or mediators, making it more difficult to ensure a fair trial. Particularly in the case of divorce and child custody, women, while allowed to initiate divorce proceedings, have few rights without male consent. Courts can fine men who refuse consent, but they have shown little initiative to grant women divorces and the right to move on with their lives. Women, particularly Arab women, have begun to attempt to use civil courts to circumvent this process, but success has been mixed.

Marriage equity for the LGBT community is similarly complicated by this model of religious law. None of the 15 religious courts that oversee marriage recognize same-sex marriage, and civil marriage does not exist. However, the government of Israel does recognize all marriages performed outside of the country, so a couple married legally outside the country would be considered married by the state—but only for statistical purposes. However, since 1994, couples have been able to access many of the same rights available to heterosexual couples through unregistered cohabitation laws.

Politics

Israel does not have a constitution, but the Israeli Declaration of Independence states, “The State of Israel . . . will ensure complete equality of social and political rights to all its inhabitants irrespective of religion, race or sex.” As has already been discussed, Israel’s political system is a balance of the status quo between secular government and the religious courts, which are controlled by conservative men and show distinct gender biases based on certain interpretations of religious law. Conflicts have arisen when the state’s Supreme Court has been asked to overrule religious courts and has shown little willingness to set more equitable precedent—including cases where women have sued to retain custody of their own children or allow for women to have the right to demand and receive a divorce.

Role in Government

Women were heavily involved in the founding of the State of Israel. Israel is one of the few countries where a woman has served as head of government (Prime Minister Golda Meir, 1969–1974, was only the third woman elected leader internationally) and has had a female vice prime minister (Tzipi Livni, 2006–2009), but it remains in the middle of the pack for gender representation in the West. While women composed nearly 27 percent of the Knesset in 2016 (World Bank 2016), they are primarily drawn from secular parties, and very few women from religious Jewish parties or Arab parties have served; in fact, the Haredi parties have never allowed female candidates, and in 2014, Haredi women activists called for a boycott if women were not allowed to run. They subsequently formed their own party to address the concerns of Haredi women. Women chair few parliamentary committees, and it was 2015 before the first Arab woman was named to chair one: Aida Touma-Silman became head of the Committee on the Status of Women and Gender Equality.

Laws and Rights

While Israeli women face many difficulties socially, their legal status is fairly straightforward. In addition to the legal protections already mentioned (including nondiscrimination laws, military regulations for advancement, etc.), in 1964, the Knesset passed the Male and Female Workers Equal Pay Law. Israeli women receive up to 14 weeks of paid maternity leave (any balance of which can be transferred to the father). Most interestingly, in 2007, the Gender Implications in Legislation Law was passed, which requires all legislation to be analyzed from the standpoint of gender equity before ratification. In practice, many of the gains of Israeli women have been hard fought and have required legal involvement (e.g., the Supreme Court was required to rule on gender segregation of buses), but a legal framework for equal rights exists.

Religious and Cultural Roles

While Israel is officially a Jewish state, there are some legal protections for the free practice of religion, and in practice, religion and secular politics are significantly entwined, particularly since proponents of strict observance are a well-organized and vocal political bloc with control over the religious courts—an agreement between secular and religious Jews based on the status quo. Judaism is

matrilineal, meaning that children are considered Jewish if their mothers are Jewish, so there are many pressures for Jewish women to marry young and raise large families. The failure to do so can be viewed as a betrayal of culture, religious identity, and the survival of the State of Israel.

Religious Leadership

While gender inequality persists in some groups, Jewish women have been rabbis, cantors, and religious leaders for decades. Reform (1972), Reconstructionist (1974), Conservative (1985), and (to some extent) Orthodox (2006) denominations have been ordaining women; holding the bat mitzvah to mirror the bar mitzvah, a ceremony in which a youth is welcomed as an adult in the religious community; and allowing women full membership in religious observation (Jewish Women's Archive 2017). The majority of Christians living in Israel are Arab and part of the Eastern Orthodox or Roman Catholic Church, both of which deny women a role in the priesthood. Muslim and Druze women similarly do not hold formal religious leadership positions.

Religion, Identity, and Political Bodies

Because of the ongoing strife, occupation, and social resentment in the area, social identification becomes a powerful and important part of personal identity. Because the roles assigned to women are keepers of home and family, women and women's bodies become symbolic of the continuation of culture and identity. As such, control of women's bodies becomes necessary for enforcing social and political differences. For example, requiring women to remain indoors or covered is talked about as "protection" from men of a different group. Israeli society is particularly macho and militaristic, trapping women in a variety of oppressive circles: Jewish and Arab women in a male-dominant society, Arab women in a Jewish society and a male-dominant culture, and so on.

Gender Segregation in Public Spaces

Gender segregation in public is a problem in some areas of the country, particularly where Haredi and conservative Muslim communities are centered. In areas where the Haredim have the most control, buses have been sex segregated (with either separate buses for women or women being required to sit at the back of the bus); images of women are not allowed in public; and street harassment

of women of all ages and ethnicities is rampant. Many argue that the Israeli state is complicit in this oppression of women by being unwilling to take on religious groups, both Jewish and Muslim, and enforce equal access.

Gender Segregation at Religious Sites

Women have limited access to both Jewish and Muslim religious sites throughout the country. The Western Wall of the temple of Jerusalem, the holiest site in Judaism, has only about a quarter of the public space available for women, and women who choose to pray there publicly are often targets of violence and harassment. The Women of the Wall are an activist group looking to reclaim the right of women to pray, wear religious garb, and participate in religious ceremony in public. Their argument remains that women should have equal access to holy sites and that government capitulation to Haredi demands denies women their legal right to full participation in the religious life of Israel.

Issues

Gender Inequality

Gender inequality has been on the rise recently, as conservative groups have gained power throughout the country. In addition to measurable markers, discussed throughout, there have been incidents of females not being allowed on stage to accept awards or speak, of male soldiers being ordered to leave the room when female soldiers are singing, and of physical intimidation and harassment of women and girls not dressed “modestly.” While such things, including segregating buses, have been found illegal by the Israeli Supreme Court, the sometimes violent reaction of men being challenged leaves people unwilling or unable to intervene. After a bus driver refused to force a woman to move to the back of a bus in Jerusalem, a riot broke out among the Haredim, and groups of men vandalized buses.

Kibbutzim

Women were a vital part in the kibbutz movement—a collectivist farming movement in the early 20th century aimed at establishing a Jewish presence in Palestine and building a model society. Throughout the movement, gender equality was an important principle of an attempt to build a “classless society” based on Jewish-Socialist principles. However, they struggled mightily against gendered assignments in the kitchen, laundry, and child care. In

some ways they were successful, but in others they struggled against gendered norms. Some of the greatest successes were in the establishment of collective child care during the day and, later, collective child-rearing. However, gender inequality did persist in deference to male opinion and “male” characteristics, and women remained largely in service work throughout the kibbutz.

After the war years and into the 1980s, there was a profound shift in the organization of the kibbutz movement, in which women, perhaps in an attempt to have the “women’s work” of child-rearing and child care become more valuable, fought to regain individual family units. While this may have increased a feeling of being valued in the community for some women, it did not lead to increased senses of personal and economic security. The economic changes at the end of the 20th century led to women feeling less secure or fulfilled in the kibbutz model.

Ethiopian Jewish Immigration

There were two major waves of immigration of Ethiopian Jews, or Beta Israel, to Israel that coincided with the major famines and political upheaval in the region in the 1980s and early 1990s. At present, around 125,000 Jews of Ethiopian descent live in Israel. The community, while fully active as Israeli citizens, has encountered difficulties both from external sources, such as racism and discrimination, and internally as they attempt to adapt to new circumstances.

The initial preparation of the Israeli government for the arrival of tens of thousands of new citizens (the Beta Israel were granted Israeli citizenship based on the right of return) was an assimilation model—basically supporting people as they adapted their lives to fit Israeli society. However, unlike other groups arriving in Israel, including Russian Jews, the Beta Israel were leaving a primarily subsistence-based and tribal society and faced unique challenges. Women in particular were facing a new life in which they were expected to continue schooling at least through 16 years of age (rather than marry at first menstruation); where they often worked outside of the home to aid in supporting their families; and where they had more rights and access to support in cases of domestic violence. As a result, immigration profoundly affected the community.

Divorce is much higher in the Beta Israel community than in broader society, thought to be in part due to the emasculation of Ethiopian men as women manage money, access contraceptives, and have support to leave violent

marriages. Female genital cutting and child marriage are rarely practiced, and the women of the community do not appear interested in reviving those traditional practices. There have been concerns about Beta Israel women being given long-acting contraception and even sterilization with a full understanding of what that means. In general, family sizes have decreased, and women are accessing contraceptive care. Because unskilled labor is often easier for women to find, they are earning their own money, or even outearning the men of the community. As many as one-third of all Beta Israel families are women-headed households, and up to two-thirds are “complex” households composed of two or more women-headed families.

Ivory Coast

Overview of Country

The Ivory Coast, which is also referred to as Côte d’Ivoire, is a former French colony located in West Africa. Its neighbors are Liberia, Guinea, Mali, Burkina Faso, and Ghana. The land is 124,503 square miles (322,462 sq. km), and it has a coastal strip in the south, savannas in the north, and dense forests in the interior. The capital city is Yamoussoukro. Abidjan is the economic capital and the third-largest Francophone city. Ivory Coast is the top exporter of cocoa; the country produces 35 percent of world’s crop (Oxfam 2013, 1).

Ivory Coast has an estimated population of 22 million people (SOS Children’s Villages 2016a). The people in the region are diverse in terms of ethnicity, but they can essentially be divided up into four groups: Mandé (primarily Malinké, Bambara and Fula) in the north; Don in the west; Bete in the central and southwest areas; and Akan (subdivided into Baoule and Agni) in the central and southeast areas. Most people are Christian, Muslim, or believers in indigenous practices. In 2014, Ivory Coast was ranked 177th out of 188 countries on the Gender Inequality Index (GII) (HDR 2015).

Ivory Coast was claimed by France in 1842, and it was a French colony with various formal connections (protectorate and republic for instance) to France from 1893 to 1960, when the country declared independence. A coup in 1999 was followed by a civil war in the early 2000s, and there was postelection violence after the 2010 election.

Girls and Teens

The sexual debut for girls happens as young as 17 years old. The adolescent fertility rate is 111 births per 1,000 teens; 50 percent of women had their first child before they turned 18. Teenage pregnancy affects a girl her whole

life, and only a third of girls who become pregnant (11–15 years old) continue with their studies thereafter (UNFPA 2013).

Education

Literacy

Girls in Ivory Coast are behind in terms of literacy rates; this can be attributed to a number of factors. In 2014, 58 percent of the country's males aged 15–24 years old could read compared to 39 percent of females the same age. In the age group of 15 and older, only 30 percent of the females could read and write. From 2008 to 2012, there was a 10 percent difference between the number of girls and boys participating in school. Girls may be more inclined to leave school because of being married off at a young age, and some girls are 14 when they get married. Forty-two percent of the population lives in poverty, and in many African families, it is seen as a good investment for a boy to go to school; a girl will get married and will not be able to look after her biological family (UNICEF 2013).

Primary Education

The academic year begins in October and ends in July. The official age for children to enter primary school is six. To lessen the burden on parents, primary schooling is free in the country, albeit the parents are required to buy books, stationary, and school bags for the children. Primary school education is compulsory, but 39 percent of children who are of primary school age are not enrolled in school (Education Policy and Data Center 2014, 2). The statistics indicate that there are more school-age girls than boys who are not enrolled in primary school (Education Policy and Data Center 2014, 2).

Secondary Education

Many of the secondary schools are in the urban areas, so children often have to move close to the city and live with relatives to continue with their education. Many pupils end up leaving before they are done with secondary schooling because there are so many obstacles, such as the stringent academic requirements that they do not meet. Often, how far children get in school is largely influenced by the level of education of their parents (Tansel 1997, 829). Sixty-four percent of girls who should be in secondary school are not, compared to 46 percent of boys the same age (Education

Policy and Data Center 2014, 1). A crucial factor in terms of who gets to go to secondary school is often money. The poorest cannot afford to go, but the rich can. Higher education is not free, so fewer people end up going (UNICEF 2013). Only 48 percent of the youth population is literate (UNICEF 2013).

Health

In 2012, after a brief experiment of offering free health care to citizens, the government had to abandon this project because of improper management, theft, and rising costs. However, women and children were still able to receive free health care, particularly for childbirth and for children who were under the age of six. Furthermore, in the 2000s, there were reports of shortages of medical personnel after civil unrest because many doctors and nurses had fled the country. After the civil unrest, there was huge demand on a limited number of medical staff.

Medicine is also relatively expensive, so poor people opt to use traditional medication, which is more common in the rural areas. The life expectancy for a man in Ivory Coast is 56.9 years, whereas it is a bit longer for women at 59.19 years (WHO 2011).

Ivory Coast has had a long history of female genital cutting (FGC), sometimes called female genital mutilation (FGM) or female circumcision. There are various reasons as to why this is a sacred ritual. Some argue that it is an important rite of passage for young girls into womanhood. Adherents argue that it is essential for girls to do it because women who are not circumcised are often stigmatized and men do not find them worthy of marriage.

This practice is particularly common in the north and the western regions of the country. According to the World Health Organization (WHO) and the Ivorian Association for the Defense of Women, 60 percent of women have undergone FGM (UNICEF 2007). The numbers of people who take part in this ritual differ with ethnicity, region, and religion. Up until 1998, there was no existing law that prohibited female circumcision (UNICEF 2007, 2). In December 1998, a law was passed that made the performance of FGM a crime punishable by up to five years in prison and fines (UNICEF 2007, 2).

Access to clean water is a serious problem. Studies have shown that, in 1993, 60 percent of the population had access to water, and approximately 80 percent had access to clean water (UNICEF 2016). Because of the struggle to access clean water, the infant mortality rates in rural areas

are high. Infrastructure is tenuous during armed conflicts, and access to clean water plummets for those affected by violence.

Maternal Health

Over a 10th of women use contraceptives. In 2006, 13 percent of married women were on contraceptives. Women are more likely to go on contraceptives rather than use traditional methods of prevention. The pill is the preferred method of contraception. Socioeconomic factors play a role in women's access to contraceptives and middle- to upper-class women are more likely to be on them. Only 5 percent of women with no education were on contraceptives, compared to 20 percent of women with a secondary education or higher. Similarly, 5 percent of rural women were using contraceptives, compared to 13 percent of urban women.

Socioeconomic status plays a huge role in whether women have medical assistance. In 2006, while 95 percent of middle- to upper-class women delivered with skilled health personnel, only 29 percent of women in the poorest quintile were able to obtain that assistance. Furthermore, 47 percent of women with no education delivered with skilled health personnel, compared to 87 percent of women with secondary education or higher (World Bank 2011).

Abortion is only legal when it has been proven by three physicians that the pregnant woman's life is in danger. However, if a woman's mental health is in jeopardy or if she was raped, she is not eligible for an abortion. Anyone who tries to abort a woman's fetus without her consent can be sentenced to 1–5 years in prison and a fine of 150,000 to 1.5 million CFA francs (USD\$262 to \$2622). A person regularly performing abortion procedures is subject to 5–10 years' imprisonment and a fine. A woman who procures, attempts, or consents to an abortion can be imprisoned for 6 months to 2 years and must pay a fine of 30,000 CFA francs (USD\$52). Medical professionals who endorse abortions, albeit not perform them, are also subject to the same penalties. Anyone found to be performing illegal abortions will be banned from working in a medical facility that treats pregnant women (SIGI 2016).

Diseases and Disorders

As of 2015, Ivory Coast had a population of 460,000 people living with HIV. In terms of adults aged 15–49, the

percentage was 3.8 percent. Of women aged 15 years and older, 250,000 were living with HIV, and 42,000 children from the ages of infant to 14 were living with HIV. In 2014, there were 22,000 AIDS-related. More than 230,000 children under the age of 17 have lost their parents due to AIDS-related illnesses (UNAIDS 2015). The first case of AIDS was diagnosed in 1985.

In 2012, the WHO reported that there had been more than 2 million cases of malaria reported within the country (WHO 2012).

Mental Illness

Since the civil war broke out in 2002, many women have witnessed physical violence and have had violence inflicted on them. During civil wars, women not only carry the risk of being killed or having their loved ones killed in front of them, they also bear the risk of being sexually violated. They are often kept alive for the purpose of being sexual slaves. In this context, it is highly likely for women to suffer from depression, posttraumatic stress disorder (PTSD), and other mental illnesses. However, the government has not invested much in ensuring that there are enough facilities to cater to those issues. In a country with 22 million people, there are only three psychiatric hospitals (IRIN 2011).

In West Africa and many other parts of Africa, mental illness is considered an affliction of demonic spirits that take over the body and the mind. Families often abandon the mentally ill person, or they think the best solution will come through prayer (IRIN 2011). Mentally ill family members are sent to churches, church camps, or spiritual healing camps, which often chain a person to a tree or a wooden block for an indefinite period while the family prays to cast out the evil spirits.

Employment

Ivory Coast is well-known for having a robust agriculture industry. Seventy percent of the population is engaged in agricultural work, raising livestock, forestry, and fishing (SOS Children's Villages 2016a). Men, women, and children all work in the fields. The division of labor is quite gendered. Men often do the heavy work in agriculture; they also do mining, construction work, and industrial work. Men dominate the civil and military positions, such as police officers, soldiers, civil servants, government officials, and top-level bureaucrats. Children often work on

family farms; in the cities, children work as vendors, shoeshiners, and car washers.

Many farmers have started producing rubber, and this has led to the industry being in competition with the cocoa producers. Many of those who have opted to produce rubber argue that it is a better option because it provides a stable income and can be harvested for 10 months. In 2011, the country produced 240,000 tons of rubber (IRIN 2013).

Because families are poor, children are often forced to work to financially assist the family. Approximately one in three children work. There are 5,000 children working on cocoa plantations, and less than 1 percent are paid for their labor. In urban areas, there is a phenomenon of “little maids,” which refers to the exploitation of poor young girls who work as domestic workers for wealthy people (SOS Children’s Villages 2016a).

In the late 1990s, many men from Burkina Faso migrated to Ivory Coast to find better socioeconomic opportunities. Many of them work in the domestic sphere for wealthy families. The work is divided by qualifications and experience. A man who cleans the house is referred to as the “petit boy” or just “boy,” despite his age; the cook is referred to as “boy cuisinier”; and the nanny is referred to as “nounou.” Wealthier households often have an entire domestic staff.

According to the Institut National de la Statistique de Côte d’Ivoire the number of employed persons in Ivory Coast decreased somewhat to 7,644,539 in 2013 (Trading Economics 2016).

Division of Labor

In rural areas, women and men divide the labor in a gendered way. The men clear the land and harvest the cash crops, such as cocoa and coffee, while women grow vegetables and other staples and perform most household tasks. Women also collect water and fuel, look after their families, spin and weave, and produce handicrafts and pottery to sell at the local markets. As mentioned before, men hold most prominent civic and government positions as well as the role of tribal chief in the villages. Religious roles, from shamans to Catholic priests to Muslim imams, are dominated by men (Every Culture 2016).

Women struggle to get work and loans. The bank will refuse to give a woman a loan unless she has a title to a house and is producing profitable cash crops, particularly cocoa and coffee (Every Culture 2016).

Ivory Coast is well-known for its cocoa-producing industry, which is a very gendered industry. Women play

key roles in the production of the cocoa. They are regularly involved in 12 of the 19 stages that occur to produce the cocoa. They play a lead role in tending the young cocoa trees and performing postharvest activities, despite the fact that cocoa farming is considered “man’s work” and off-limits to women. Men dominate the leadership in the cocoa industry, and it is rare to find a woman who owns a cocoa farm (Oxfam 2013, 3).

Family Life

The law in Ivory Coast prohibits any woman under the age of 18, men who are under the age of 20 from getting married without parental consent. Despite this, one-third of young women are married before they reach 18 (UNFPA 2013). The government does not recognize forced marriages or dowry that is paid to the mother’s family. Traditional marriages often happen with the bride being as young as 14, a practice that is common in the northern communities (Every Culture 2016).

A law was passed in 1964 outlawing polygamy; anyone entering a polygamous marriage post-1964 risks being fined (Every Culture 2016). Polygamous marriages that occurred prior to the law being passed are exempt. The law and its associated penalties seem to have done little to deter people from entering polygamous marriages. Divorced women are prohibited from remarrying for at least 300 days from the date the divorce is announced. Divorce is not common, but it is socially accepted among many ethnic groups.

Regarding inheritance rights, in the case of a spousal death, the common property is divided in accordance to the marriage act. Though the law makes no gender distinction, in practice, women often do not inherit. Different groups have varying traditions, but male relatives often rank above the surviving spouse in the inheritance of property. The wife is excluded if there are children because the property is inherited by them (SIGI 2016). Children can inherit from their parents, grandparents, or any relatives, regardless of their gender.

Sports and Recreation

The most popular sport in Ivory Coast is football (soccer). You will find a football field in almost every city and every village. The country has hosted a number of sporting competitions, and in 1984, the African Cup of Nations was hosted there. The national team came in fifth place. Other

sports that are gaining popularity are rugby and basketball. The country has women's teams. In 2015, the women's team played teams outside of the African continent for the first time and took part in the World Cup (Kessel 2015).

Politics

The structure of the government is similar to many governments in Europe. The country is led by the president and prime minister, and the government is divided into three branches: the executive, judiciary, and legislative. The executive branch of the government is headed by the president of the country, who is in office for a term of five years. The president is the chief of the armed forces, and other duties include negotiating treaties and ratifying those deemed necessary. In the case of death, the successor would be the president of the National Assembly, who would step in until the end of the term. The current president is President Alassane Ouattara, who was reelected in 2015 for another term.

The judiciary branch establishes the laws of the country. There are divisions for different kinds of legal issues. The highest court is the Supreme Court, which oversees most of the judicial functions.

The legislative branch is run by the National Assembly, which is composed of elected officials. They are elected for a term of five years, and they are there to represent a constituency of the population. One of their responsibilities is to pass laws that the president makes.

In a report released by the World Bank, it was revealed that even though women are the majority in the country (52%), out of 29 government ministers, only 5 are women, and only 10 percent of the deputies in the National Assembly are women. In 2016, there were a total of 9 women among the 36-member cabinet (World Bank 2013).

Laws Regarding Women

Because Ivory Coast is a patriarchal society, there is no specific law that penalizes men for physically beating their wives (SIGI 2016). Many people believe domestic violence is a private issue that needs to be resolved quietly and privately within the home, so the state does not think it should be necessary to intervene. Many young women believe it is acceptable for a man to beat his wife.

Women are thought to have given men their eternal sexual consent, which means that, by law, she cannot claim to be raped by her husband, even if the union occurred when

she was young or forced to marry. Rape outside of this context is considered illegal. The sentence is life imprisonment if the perpetrator is assisted in his or her crime by one or more persons; is the father, an older relative, or a person with authority over the victim; or is responsible for the victim's education or intellectual or professional training. Life imprisonment is also given when the victim is a minor (younger than 15 years).

Nongovernmental Organizations

There are many humanitarian nongovernmental organizations (NGOs) in the country, namely, UNICEF and Amnesty International, both of which monitor and report on human rights violations in the country. A local NGO is the Organization of Active Women in Ivory Coast (OFACI), which formed in 1999. A group of young women came together because of their shared love for equality and justice. They created the organization to focus on promoting and protecting the rights of women; promoting the political empowerment, economic, and social status of women; organizing literacy activities for girls; and designing and implementing development projects that benefit women.

Land Rights

Women only own 18 percent of the land in Ivory Coast (World Bank 2013). Women are usually obligated to ask their husbands or family to cultivate food crops on the land. By law, once a woman is married, the man is considered the head of the household, and he then has the authority to control the family's assets, including the land.

LGBT Rights

In Ivory Coast, there are no laws that decriminalize people for being homosexual or transgender. But many communities are hostile toward the LGBT (lesbian, gay, bisexual, and transgender) community. In 1994, a group of transgender activists stormed a media house after they had "sarcastically reported" on the transgender community in a way that was offensive. These activists assaulted journalists and broke a number of windows. This event and many others led to the formation of the group *L'association des travestis de Côte d'Ivoire* (Travesti Association of Côte d'Ivoire). A few years later, a French documentary, *Woubi Chéri*, provided insight on the transgender community and how sex work plays a huge financial role in many

marginalized communities, such as the LGBT community. Shortly after this documentary was released, the leader of L'association des travestis de Côte d'Ivoire left the country for Canada, and the group lost its momentum (Thomann and Corey-Boulet 2015, 9).

A lot of work has focused on the lives of the LGBT community. LGBT lives are affected by violence from the church, the army, the police, local communities, and even hospitals. In 2014, a prominent gay rights organization, Alternative, had their offices ransacked and vandalized by a group of 200 people. The group made off with computers, threw garbage over the walls, and hung signs that read, "Stop the homos." Even in safe spaces such as gay bars, the LGBT community is harassed by the police and the army (Thomann and Corey-Boulet 2015).

Religious and Cultural Roles

About 60 percent of the population adheres to indigenous beliefs, 25 percent are Muslim, and 12 percent are Christian (Every Culture 2016). Christianity is the main religion in the south and the center of the country. Islam is dominant in the north and northeast regions (although many Muslims have moved south in search of work), and indigenous belief systems are present throughout the land. Even when people convert to Islam and Christianity, many continue to observe the rituals of indigenous beliefs, which include communicating and worshipping ancestors.

Issues

Sex Work

Sex work is not illegal; however, it is illegal to solicit for the purposes of sex work. If a sex worker is found soliciting, she or he can be sentenced to three years in prison. Sex work is defined as a "breach of morality" under the law. After the civil war, many women turned to sex work as a way to get a stable income. Sex workers have to deal with a lot of stigma and harassment that leaves them vulnerable to violence and makes it difficult to access health care. According to a 2012 Demographic Health Survey (DHS), 28.7 percent of sex workers are HIV positive (NSWP 2016).

In 2007, an organisation that focuses on sex workers' human rights, Bléty, was formed. The organization lobbies political actors and health sectors for help in making sex work safer for sex workers (NSWP 2016).

Disability

Currently, there are no statistics about the number of children living with disabilities in the country. An official report estimates that at least 30 percent of children in Ivory Coast have a cognitive or physical disability and that only 10 percent of the disabled population is receiving any kind of service (Bayat 2013, 5). The country has no laws pertaining to the human, social, or educational rights of disabled people. There are a few programs aimed at disabled children, but nothing is available for disabled adults.

In Ivory Coast, disabled children are viewed with suspicion. It is believed that a child that is born disabled is a result of witchcraft. Traditional beliefs recommend that a disabled child be killed. If not, then the onus is on the parents to take care of the child, particularly the mother. In some cases, the mother is sent away with their child. The sending away of the disabled child might have to do with the belief that if anything goes wrong within the community, the blame is placed on the disabled child and the evil spirit that the child carries.

Violence of the Military

The Ivory Coast has a long history of violence, and this violence is keenly felt today by sex workers and the LGBT community. The army, Forces Républicaines de Côte d'Ivoire (FRCI), is notorious for disrupting places that are only meant for the LGBT community or sex workers. Sex workers speak of being arrested or coerced into having sex with the military to not get arrested. In 2012, a gay night club was raided by the FRCI, who demanded free drinks; they also proceeded to humiliate the trans people by asking them to go outside and strip off their clothes (Thomann and Corey-Boulet 2015, 2).

Women's Activism

In 2011, a group of women activists organised a march on International Women's Day. This march was organized after the president refused to cede power despite the country's election commission announcing that his opposition had won by a majority vote in the previous year's election (Smith 2011). This protest, like others, ended in bloodshed. A week before the protest on International Women's Day, seven women were killed by Gbagbo's soldiers at a peaceful protest (Smith 2011). A subsequent protest was organized in resistance to this violence, and 15,000 people participated. It was organized by Aya Virginie Toure.

Some women protested naked. In Ivory Coast, as in many African communities, a naked woman in public insults or curses the person who sees her bare body, particularly if the viewer is a man. The organizer for this protest, Aya Virginie Toure, a 58-year-old grandmother, faced threats as a result. She could not sleep in her own home and had to sleep in different places each night to make it harder for the military to find her (Okeowo 2011).

The Impact of the War on Women

When there is conflict, women often suffer the most. Women's bodies are used as tools to humiliate men by showing them that they cannot do what men ought to do, which is protect women and their families. Women and girls are repeatedly raped by soldiers. Some are raped while their family members are forced to watch. Some women report trying to flee to Liberia; if caught by the soldiers, they can be taken away and kept at the men's homes as sex slaves for as long as the soldiers deem fit. Some manage to escape; others are not so fortunate. Speaking out about sexual violence as a survivor is a difficult thing for many women in Ivory Coast because of the shame and stigma that comes with it. There is also the fear of speaking out for fear of rejection by their communities and families. It is estimated that only one-tenth of all sexual violence incidents are reported (Pender 2011).

Trafficking

Ivory Coast is well-known for its cocoa industry, and many corporations base their manufacturing in the country. The industry is closely linked with child labor and child trafficking. Many families allow their children, particularly boys aged 12–16, sometimes even younger, to work on the cocoa farms because of the money they will earn. These boys earn little in wages and are often physically abused on the farms.

Sometimes men in Mali and other neighboring countries find poor, homeless boys and offer them work; they then “sell” the boys to the cocoa farmers for cheap farm labor. A UNICEF report concluded that 200,000 children are trafficked yearly in West and Central Africa (Chanthavong 2002). There are about 600,000 cocoa farms in the Ivory Coast, and they are often in isolated areas. It is difficult for other adults to notice and report these abuses to the authorities. Children who work on cocoa farms are often subject to psychological and physical abuse. They

may try escape, but if they fail, they are brutally beaten. Their living conditions are awful, and they are often not well fed.

J

Jordan

Overview of Country

The Hashemite Kingdom of Jordan reflects both modernity and deeply rooted traditions. The country embodies a unique juxtaposition of old and new, varying by city and neighborhood. In Amman, the country's capital, one can encounter Westernized university students and liberal upper-class families and minutes later be in a very poor conservative area. Just a few hours outside the city, Bedouin villages, and refugee camps become more common. Situated with Syria to its north, Iraq to the northeast, Saudi Arabia to the east and south, and Israel and the Palestinian National Authority to the west, Jordan is at the center of the Arab world (United Nations in Jordan 2014). Though the kingdom is relatively young, having established its constitution in 1952, Jordan plays a pivotal role in Middle Eastern politics. Jordan has a rich religious history, making it a holy land for the *ah al-Kitab*, or “people of the book,” which refers to Muslims, Christians, and Jews. More than 92 percent of Jordanians are Sunni Muslims, 6 percent are Christian, and there are some small Shia and Druze populations as well (Pluralism Project at Harvard University 2014).

The people of Jordan are ethnically diverse. The majority of Jordan's 6.5 million people are Arabs who descended from Bedouin, or nomadic, tribes, who presently inhabit

the east and south of the country. Traditionally, they lived in tents called *bait al-shar* (literally “house of hair”); however, only a small portion of the Bedouins today can be described as truly nomadic, as most have adopted sedentary lifestyles within villages consisting of large extended families. They have persevered the simplicity of the Bedouin lifestyle while settling into sedentary communities (Keys to the Kingdom 2001a).

Jordanians of Palestinian origin make up roughly 1.4 million of the population. Jordan was the only Arab state to grant them full citizenship when they were forced from their homeland during the 1948 and 1976 wars with Israel (UNRWA 2014). Many Palestinians continue to live in refugee camps, particularly in the West Bank and in northern parts of Jordan. Although the influx of Palestinians has strained the economy, they have contributed both politically and economically to their adopted country. Syrian refugees also represent an increasing segment of Jordanian society due to their government's instability. Numbering nearly 600,000, they struggle to secure employment and adequate housing in Jordan (Migration Policy Center 2014). Other minority groups in Jordan include small numbers of Circassians, Armenians, Chechens, and Druze (Keys to the Kingdom 2001a).

Despite Jordan's important political role and diverse ethnic makeup, it is a relatively small country with limited natural resources. Jordan is considered an upper middle-income country; however, with continued refugee

immigration, the country is forced to assess its limited water supply and innovate ways to use existing resources more efficiently. Jordan relies on external sources for the majority of its energy requirements. Tourism contributed 6 percent directly to Jordan's GDP, and 20 percent indirectly in 2015, but the industry has been threatened by unrest and civil war in the region (Wilson 2017). Furthermore, unemployment rates in 2010 were twice as high for women as they are for men (10.4% vs. 21.7%). Also notable is that 78 percent of unemployed women are educated (holding a college diploma or higher). Jordan has a very young population; almost 70 percent of its inhabitants are under the age of 30 (UNDP 2012). This number suggests that heavily investing in youth programs and incentives would help stabilize the economy by creating job security and lowering the poverty level. Women and girls in particular are vital to this process.

Girls and Teens

Education

Education in Jordan is of high priority to the royal family and the local culture. Often seen as an indicator of status, wealth, and character, education has become increasingly important since the middle of the 20th century. Education in Jordan consists of four levels: kindergarten, ages 4–5 years old (mostly operated by private and nongovernmental organizations); basic education, ages 6–16 years old (compulsory stage for all children); secondary education, 17–18 years old; and higher education. The Ministry of Education oversees the first three stages, and the Ministry of Higher Education and Scientific Research administers university-level education. Basic education consists of both private and public schools, which are generally segregated by gender, although some international schools allow for mixed classrooms. At the secondary level, students are placed based on their interests and have three options: academic secondary education, vocation secondary education, or applied secondary education. The first two prepare students for the General Secondary Education Examination Certificate, which is earned by completing the *tawjihi*, the general secondary examination (UNESCO 2011). Students' exam scores determine whether they will be accepted at a public university. Due to the low fees and limited numbers for enrollment, students strive to be accepted at one of these universities. Private universities are more expensive but have fewer admissions requirements than public institutions (Jansen 2006, 476).

Jordan's educational system is highly regarded in the region due to the drastic improvement in literacy rates and the compulsory stage being free for all Jordanian children. Both the quality and accessibility of education generally works in favor of women. The selection process for public universities is relatively open and objective, and women enroll at a higher rate than male students (Jansen 2006, 480). The growing presence of women studying at public universities can be attributed to several underlying cultural attitudes that shape the educational path of most Jordanian women.

A highly educated son or daughter brings pride and social status to a family. Attitudes in Jordan are generally favorable for women pursuing higher education, and daughters can greatly influence their family's reputation by being highly educated. A highly educated woman, particularly if she has not put her education to economic use, can be a symbol of prestige for her father and her future husband. If a woman's family is wealthy enough to educate her for leisure, it shows that she is from a good family and will make a good partner, enhancing her attractiveness to potential suitors (Jansen 2006, 485–486). It is also viewed, in rare cases, as a type of insurance in case a divorce occurs. Obtaining a higher education is an asset for women, and the majority of women in Jordan report wanting to study past the secondary level (Christrup and Eklund 2009, 33).

The enrollment of women at public universities remains higher than that of men. Jordan is now one of eight Middle Eastern countries in which more women attend university than men. However, women are encouraged to apply for public institutions, as they are typically expected to have shorter educational paths and careers due to family obligations after marriage (Jansen 2006, 482). Girls also have to prove themselves to their families and fight for the right to study at the university level more often than boys. For example, culturally, women stay inside the home more than men do. This is related to the dichotomy between the public and private spheres within traditional Arab society (Jansen 2006, 480). Therefore, being educated is an opportunity, as some women describe it, to feel free.

The education of women is a right in Islam, and because there are plenty of segregated universities and women-only universities, it is harder for families to object when a daughter wants to pursue higher education. Studying allows women to still conform to local gender norms while enhancing themselves and finding freedom and recognition. Many educators in Jordan report that girls from a young age are taught to be obedient, restricted in

movement, and patient, all qualities that are critical for high academic attainment (Jansen 2006, 483). Segregation proves to have a positive effect on the diversity of fields women choose to study.

The gender gap in education in Arab countries has been a source of criticism in years past. Since the educational reform in the last several decades, it is evident that the number of women students has dramatically improved, and education is of top importance in Jordanian society. However, enrollment numbers and degrees obtained cannot be a singular measure of women's liberation. It is crucial to examine the connection between employment and the political representation of women and the rise of education, as well as review patriarchal attitudes that shape the educational opportunities women are allowed. For example, many Jordanian women are still less likely to be allowed by their families to study abroad like their brothers. Thus, although education is a substantial gain, it has not necessarily translated into progress for women in other facets of Jordanian society, and there are still underlying social values that shape women's education that cannot go unexamined.

Literacy

The adult literacy rate for Jordanian women rose from 55 percent to 86 percent between 1980 and 2002. Today, the literacy rate is approximately 96 percent. There are still some older women, particularly in rural communities, who are illiterate and have never attended formal schooling (World Bank 2013).

Employment

The unemployment level among educated women in Jordan is more than 35 percent. A lack of natural resources coupled with prevailing patriarchal attitudes about women in the workplace put Jordanian women's employment status and pay equity at a large disadvantage. The country faces several obstacles in achieving economic revenue, namely, scarcity of water supplies, dependency on oil imports, and only 10 percent of its land being arable. Jordan's most lucrative sector of the economy is tourism, but that still leaves many educated Jordanians unemployed. Educated women are more likely to be unemployed than educated men.

Although more Jordanians are educated and pursuing advanced degrees, the curriculum has not been revised and does not train analytically minded students. The educational

system is not in accord with what many employers are seeking, especially within the private sector (Banihani 2014). Furthermore, the government's structural adjustments that decreased the size of the public sector eliminated many jobs for both men and women, but they hurt potential women employees more. Historically, the public sector has offered higher salaries, more job protection, and more social security for educated women than private-sector jobs. Within the public sector, there is a preference for male employees; therefore, the decrease leaves more educated women jobless (Miles 2002, 415–416). Employers use standard excuses that women have more responsibilities in the home, lack of business experience, and other religious and cultural values as reasons for not hiring women.

It is not just Jordan's limited economy or explicit sexism among employers, however, that are deterring women from obtaining employment. Cultural and familial factors are a great determinant of a woman's employment status. Cultural ideals about female mobility place many restrictions on the job situation a woman pursues. She will have to consider how far the workplace is from her home, how much contact she will have with men, what hours she will be required to work, and whether these issues are in agreement with her family's beliefs (Schiff 2012). "In Arab society, family honor depends mainly on the conformity of its female members to certain norms and values centered on modesty. Traditionally, women's behaviors have been severely restricted, limiting their activities to the domestic sphere; gainful employment was not considered part of women's role" (Miles 2002, 413). This creates many limits on highly educated women who have much to offer to the economy.

Despite huge advancements in women's education in Jordan, female participation in the workforce remains low. This paradox indicates that women's abilities, talents, and knowledge are not being utilized to their fullest potential, robbing the Jordanian economy of lucrative opportunities for growth and stability (Schiff 2012).

Pay Equity

Jordanian women who do find employment face further gender-based discrimination. Women working in the same profession as male colleagues with equal skill sets are still paid less. Almost half of employed women are professionals, and they earn considerably less than male professionals. The average hourly wage for such women is 33 percent less than their male counterparts (Jordan Pay

Equity 2012). Such discrimination is increasing, according to recent studies.

Inequity in pay is especially problematic, as it may contribute to higher rates of unemployed educated and highly skilled women in the long term. Combined with other aforementioned factors that create substantial barriers to women's employment, the prospect of pay discrimination is a further deterrent, especially for women who are the heads of their households (Jordan Pay Equity 2012).

Maternity Leave

In June 1996, working mothers were provided with additional legal protection. The new labor law includes an article that prohibits employers from terminating their jobs or giving them notice about termination if they are past their sixth month of pregnancy or on maternity leave. It also gives mothers 10 weeks of paid maternity leave, compared with the previous allowance of 8 weeks, as well as an hour a day for breastfeeding during the first year after delivery and a year's unpaid leave to care for their newborns (Bitar 2011). However, this law has had little influence over employers, especially within the private sector, which still prefers to hire men for convenience and because of gender-biased attitudes.

Family Life

Gender Roles and Family Structure

The family unit in Jordan can be categorized by religion (Muslim, Christian); region (north, middle, south); residence (urban, rural, Bedouin, refugee camp); national affiliation (Jordanian, Palestinian, other); family type (nuclear, extended); or family lifestyle (conservative, liberal) (Department of Statistics 2012). Within many religious practices, particularly monotheistic faiths such as Islam, Christianity, and Judaism, there is a commitment to the primacy of family and marriage in maintaining society. This dedication to preserving the family is common worldwide and is not limited to Arab states. In Jordan, the family unit provides a collective identity and responsibility, and nothing is considered individual or private, as every action represents the family name.

Regardless of how categories overlap for particular families and communities, Jordanian society is patriarchal. Male family members are afforded more social, material, and economic power than female family members and children. The male head of the household is given the

responsibility of providing financial support in exchange for the woman's fidelity, obedience, maintenance of the home, and caregiving for the children and extended family. Jordanian culture is based on conservative attitudes about gender roles, and the behavior of men and women is thus strictly defined by the social system. Deviance from the prescribed roles can result in family shame, especially when the deviant is female (Abu-Lughod 1986; Badawi 1995; Mernissi 1975).

Within many Arab societies, such as Jordan, men and women are portrayed as fundamentally different, as they were created to be by Allah. Men and women are defined by their biology, particularly because of women's ability to become mothers. There is a hadith, (a saying of the Prophet Muhammad, peace be upon him) that paradise lies at the mother's feet. Mothers deserve the utmost respect (Jawad 1998). However, some argue that there is little room outside of this for women to find a role in society. One of their primary duties is to become mothers, which comes after being a wife, of course. Every Muslim girl is socialized to look forward to marriage (Murphy-Geiss 2010, 41). This religious belief helps explain why some women choose to be homemakers, and why employers are sometimes hesitant to hire female employees. It could be difficult for a woman to maintain her commitment to her role as a wife and mother and fulfill her work responsibilities (Salehi-Ifshani and Dhillon 2008, 23).

Marriage and Sexuality

For Jordanians, both men and women are expected to marry. In Islam, marriage completes half of one's religion. Marriage is also a means of economic security and creates the bridging of two families that are usually from the same socioeconomic level. Life is lived according to the desires of one's family, and marriage is the goal. However, male and female Jordanian youth experience the transition between childhood and adulthood and marriage very differently. Young men experience the pressure of finding employment, generating savings to assist family members, financing marriage, and securing a home. Throughout this time, they have unrestrained mobility and have numerous opportunities for socializing outside of the home. It is common to see young men hanging out at hookah shops, in restaurants, and in urban downtown areas, even late at night. Young women, on the other hand, have fewer options during their *waithood* (time between puberty and marriage) and face more restrictions, as they have to navigate

prevalent social and cultural gender norms regarding public spaces (Kaya 2009). Public spaces, though not regulated by law, as in some more conservative Islamic countries, are regulated by tradition and the size of the town. In some ways, this time is beneficial for women, especially in the last 30 years, as they have had more opportunities to pursue higher education, which has increased the average marriage age of women. However, these do not include employment opportunities during waitthood.

This period of waitthood also indicates important values regarding female sexuality and virginity in Jordanian culture. Though both men and women in Islam are commanded to remain chaste before marriage, it is culturally of more importance for women, as is common in many cultures, both Eastern and Western. In some parts of Jordan, the tradition of checking the sheets for blood after the wedding night is still common. Several Arab feminists (Fatimah Mernissi, Lila Abu-Lughod, and Nawal El Saadawi) studying the customs and practices of Islam have highlighted the particular ways a patriarchal family is maintained, including defining female and feminine sexuality as being potentially uncontrollable. This ideology explains the necessity of cultural rules and regulations for women, such as curfews, enforcement of female modesty, segregation, and the dichotomy of public and private spaces in Arab-Islamic patriarchal social structure. Even in the Arabic language, the word *fitna*, loosely translated as “chaos,” refers to a destructively erotic woman. Thus, women are seen to embody an uncontrollable sexual nature that is harmful to men and can distract them from their social and religious duties (Mernissi 1975, 4). Therefore, the responsibility is placed on women, through many of the aforementioned conditions of social behavior, to maintain social order. Otherwise, she will bring dishonor and shame upon her family.

In Amman, especially near mixed universities and in the upscale neighborhood of Abdoun, it is not uncommon to see women who forgo wearing a hijab. However, the rest of Jordan, especially in the rural areas, most women do observe the hijab and wear traditional clothing. In many discussions about the rights of Arab women, Western feminists have portrayed the hijab as the ultimate indication of female oppression. However, feminist scholars of the Middle East argue that this mind-set has to change. Even if one opposes the state imposition of wearing the hijab, it should not be a marker of women’s freedom or lack thereof (Abu-Lughod 1986). In fact, more Muslim women in both the West and Jordan are *choosing* to wear the hijab. Some

see it as compulsory in religion, and others wear it for a sense of control over what others can see of their bodies, which is arguably equally liberating (Kaya 2010).

Women’s liberation can look different depending on the culture and the religious attitudes of a particular society. Some Muslim women have been suspicious of Western feminism, as it has been used in the past as a guise for colonialism and Western control of Arab land. The work of some Muslim feminists has developed largely as a response to the ways that some forms of Western feminism excludes religion. Consequently, it is evident that Muslim feminists have found liberation in their religious beliefs and used these ideologies as tools for furthering the women’s movement in Jordan.

Fertility Rates

In 2012, the average total fertility rate was 3.4 children in urban settings and 3.9 children in rural areas. Fertility for the 15–19 age group is very low, and, on average, a woman in Jordan will have given birth to less than one child by age 25. The fertility rates rise dramatically for women between the ages of 25 to 29 and decrease slowly after 29 (Department of Statistics 2012). These numbers reflect the importance that is placed on women’s education in Jordan, which delays the age at which women marry and begin bearing children.

Contraception

In 2012, 59 percent of married women aged 15–49 were using some method of contraception, and 42 percent were using a modern method (Department of Statistics 2012). Nonmodern methods include the rhythm method and pulling out. Contraception is readily available in Jordan, and there is little correlation between level of education and contraceptive use. While social attitudes in Jordan are generally favorable of contraceptive use, there are many variances in beliefs about acceptable methods and reasons for using methods. For example, there is still a small portion of society with the extremely conservative belief that family planning is forbidden in Islam and that family size should be determined by God. Sterilization is uncommon. However, the majority of Jordanians agree that family planning is acceptable to preserve the health of the mother and for birth spacing and financial reasons. The most common reasons for not using modern contraceptive methods are breastfeeding and pregnancy (Mahadeen et al. 2012).

Reproductive services for unmarried Jordanian women and youth are lacking. Studies indicate that there are still major barriers to accessing quality information and services, such as unpleasant facilities and ill-informed staff. Jordanian youth, especially girls, have traditionally been shielded from information about disease prevention and reproductive health until the time of marriage (Khalaf et al. 2009, 321).

LGBT Rights

Jordan is the only Arab country where homosexuality is not a crime; however, tradition keeps many in the LGBT community silenced and discriminated against. Since 2008, they have been allowed to form organizations, but most Jordanians do not support these actions; groups are never granted licenses. Activists would like to create support networks to provide housing for those who are rejected by their families and have nowhere else to go (Deutsche Welle 2014). It is a huge social taboo for any person to live as openly gay, and violence is an imminent threat, especially from radical Islamists. Homosexuality is seen as *haram* (forbidden) (Al Arabiya 2014).

Health

Health Care Access and Overview

Healthcare in Jordan is considered one of the most effective and modern infrastructures in the Middle East. Their system is divided into two categories: public and private. The Ministry of Health oversees civil insurance, for which any citizen, resident, or visitor is eligible. Royal Medical Services covers military insurance and private customers. Private insurance is operated through hospitals and clinics. Nongovernmental organizations (NGOs) and international groups provide much of the medical care for refugees. Technically, it would appear that, based on this system, every person is covered and has his or her medical needs met. However, with a two-tiered health system, inequities are evident in the distribution of health care expenditures. The private sector only provides 20 percent of health services, and yet 60 percent of the health expenditure is in this category. The public sector provides 80 percent of services and has only 40 percent of the expenditure. A quarter of the population is reported to be uninsured, and out-of-pocket expenses for pharmaceuticals are common. Women access health services more frequently than men due to reproductive- and childbirth-related needs (Bpharm 2017).

Diseases and Disorders

Through widespread education, Jordan has significantly reduced the rates of communicable diseases. However, noncommunicable diseases have increased. These include but are not limited to cancer, diabetes, and cardiovascular conditions. These diseases are likely a result of economic burden as well as social and geopolitical pressures. For example, smoking cigarettes and hookah is a common practice. Jordan has a low prevalence of HIV/AIDS (Bpharm 2007).

Breast cancer is becoming increasingly more common among women in Jordan and has a high mortality rate due to late detection. Breast cancer is also the leading cause of cancer deaths among Jordanian women. Public awareness of the issue is lacking, and further education should be prioritized regarding breast examinations and detecting symptoms (Kawar 2009).

Childbirth and Maternal Health Care

The infant mortality rate—neonatal and postnatal—has decreased steadily, and the quality of maternal care is considered exceptionally high for the region. In Jordan, less than 3 percent of women give birth at home, and 97 percent deliver in a health care facility (Sweidan et al. 2008, 59). These facilities are well equipped to deal with medical emergencies; however, women in Jordan still lack control over their birthing options. Many unnecessary practices persist with uncomplicated, low-risk births, such as limited mobility during labor, being strapped down during delivery, and limited allowable social support during the process. For example, husbands are allowed in the delivery room during labor less than 50 percent of the time, and 77 percent of the time no companion is allowed during delivery for support (62). The majority of women are also given some sort of pain medication, whether necessary or not, for a safe delivery. Jordanian women need more information about delivery options to exercise their preferences, and Jordanian hospitals are advised to implement more thorough evaluations of their practices (66).

Politics

Suffrage

Jordanian women gained the right to vote and to run for candidacy in parliamentary elections in 1974; however, due to political situations that influenced the openness of

the political structure, they were not able to exercise these rights until 1989 (Dababneh 2012, 216).

Structure of Government

The Hashemite Kingdom of Jordan is a constitutional monarchy with representative government. The monarch is the head of state, chief executive, and commander in chief of the armed forces. The council of ministers, or cabinet, is accountable to the House of Deputies, which, along with the Senate governs the legislative branch. The judicial branch remains independent. The government of Jordan is committed to democratization and reforms that further the empowerment of Jordanian citizens (Keys to the Kingdom 2001b).

Armed Forces

The Directorate of Women's Affairs was established in 1994 to protect the rights of women serving in the Jordanian Armed Forces. Princess Aisha, King Hussein's daughter, who heads the directorate, pushed for legislation to lengthen maternity leave to 90 days and to provide better opportunities and training to match women's skills and goals with appropriate career paths. Doing so has advanced the role of women and capabilities of the military (Keys to the Kingdom 2001c).

Personal Status Law

In Jordan, the majority of family matters are viewed through the personal status law preceded over in sharia courts. Women are considered equal under the civil code, but under the personal status law, they become inferior. This includes all matters related to marriage, divorce, and inheritance. All single women (divorced, widowed, and never married) under the age of 40 are considered to be legal minors and technically under the guardianship of male relatives. They cannot apply for a passport without a male guardian's approval, and men are recognized as the sole legal guardians of children (SIGI 2012). In the case of divorce, women are allowed to keep their children until they reach puberty and then they may decide with whom they want to live. However, if a woman remarries, the children must live with their biological father, his mother, or the wife's mother, per the court's decision. Men have the right to divorce their wives through registering with the court and awarding financial compensation to the wife. A wife must petition for a divorce, and although domestic

Queen Noor

Her Majesty Queen Noor of Jordan is an Arab American who has been a pioneer for women's rights and development in Jordan as well as globally. After marrying into the royal family in 1978, she founded the Noor Al Hussein Foundation (NHF), which she chairs. The organization maintains revolutionary best-practice programs in poverty eradication, sustainable development, cross-cultural understanding, and women's microfinance. NHF also provides training and assistance to further develop related programs in the broader Arab and Asian regions.

Queen Noor is a firm believer in aiding women's progress and has addressed concerns that the Arab Spring and rise of political Islam will set women back. "Islam should not be considered the source of misogyny and women's oppression in the region," she said, adding that while women still have much progress to make, many advancements have been made in the way of education, quality of life, and economic skills that cannot go ignored. Queen Noor has paved the way for continued women's progress in Jordan and neighboring countries, and her legacy will continue to benefit women globally.

—Kristin K. Chase

violence is grounds for divorce, it is difficult to prove, as it requires two adult male witnesses (Tabet 2005, 12–13). While women's movements in Jordan have made advancements in education, employment, and health care, much reform must happen with the personal status law for Jordanian women to have autonomy.

Citizenship and Nationality

One of the most pressing issues facing women today, which has recently gained momentum with the backing of women's rights groups, is the right for Jordanian women married to non-Jordanian men to pass their citizenship to their children or their husbands. While Jordanian law does allow for the possibility of naturalization for non-Jordanian husbands, it is at the discretion of the Council of Ministers. The majority of women who pursue this process receive rejection letters with no explanation.

The current nationality law creates countless difficulties for women and their families. Noncitizens are subject to

high foreigner fees, such as work permits, which must be paid annually. Their children are required to pay higher fees for university enrollment, and they are not eligible for government scholarships. If a woman is in a troublesome marriage, the discriminatory nationality law puts her at risk of losing her children. If they do not share her Jordanian nationality, they are registered under her husband's nationality and only have passports from his country. This means that the husband could leave at any time with their children, and she would be forced to fight a foreign court to have access to her children (Equality Now 2012; Tabet 2005; Husseini 2010).

The Arab Women Organization, the Human Rights Committee (HRC), the Committee on the Elimination of Discrimination against Women (CEDAW), and the Committee on the Rights of the Child have urged Jordan to amend this nationality law. As of January 2014, the government of Jordan gave approval to grant foreign spouses of Jordanian women and their children specific civil rights, such as residence permits, and improved access to education, medical care, and work in the private sector (United Nations Women Watch 2008). This will considerably alleviate some of the stressors on these families. However, the government is still urged to reform the sex discriminatory nationality law.

Religion and Cultural Roles

Women's Roles

Islam is the primary religion in Jordan, and only 4 percent of the population is Christian. Although perceived by many Westerners as harmful for women, Islam guarantees specific rights for women. In many Muslim societies, there are often discrepancies about what regulations and obligations are cultural and which are religious, per varying interpretations of the Koran. However, something that is clear and undisputed is that prior to Islam, the world lived in a time of ignorance, or *jahiliyya*, specifically because women were viewed as property that could be traded for the benefit of men, and men could take an unlimited number of wives. Female infanticide was also a common practice before Islam was widely accepted in Arabia. Around the year 613, when Prophet Muhammad (PBUH) started preaching in Mecca, the status of women was elevated. Women were allowed to run businesses, enter into legal contracts, and own property without the supervision of *mahram*, or male guardian (Jawwad 1998). Men were also restricted to four wives. Islam created a limit and specific

conditions for men who wanted more than one wife. For example, each wife must be treated and provided for equally. Therefore, the man must have the financial ability to care for more than one woman. The Prophet encouraged polygamy to care for widows and orphans, not as a fulfillment for men's desires.

Women also played a prominent role in the early days of Islam, such as the Prophet's wives, Khadija and Aysha. Khadija was a prominent businesswoman who gave the Prophet advice and was his first supporter. Today, Muslim women in Jordan can teach other women at a local mosque and administer community events and charity. Islam emphasizes that women should be given the same opportunities as men and that it is their right to contribute to society through the development of their education and personal abilities (Sonbol 2002; Badawi 1995).

Religious Law

Jordan's Constitution allows individuals the freedom to practice their religion unless they violate public order or morality. The official state religion is Islam, which has an evident appearance in the country. For example, the call to prayer can be heard throughout the country five times a day. Men often pray in public spaces, and, especially among the elderly, they can be seen reciting Islamic sayings and counting prayer beads for good deeds. It is also common for Muslims to proselytize to non-Muslims. In Jordan, it is illegal for a Muslim to convert from Islam to any other religion, and it is against the law to proselytize to Muslims. Converts to any religion besides Islam are at risk for being ostracized from their families and social networks. Jordanians who choose to convert from Islam also risk losing their civil rights and being prosecuted by the sharia courts.

Issues

Gender-Based Violence (GBV)

Research on gender-based violence in Jordan has been continuous since 1998, with an increase over the past few years. Women's rights organizations, human rights groups, and academic institutions have contributed numerous studies and publications that are widely accessible regarding various aspects of GBV in the kingdom. However, there are no national figures on GBV in Jordan to provide statistical data. What these studies do show is that women are speaking out about their experiences and that more awareness is being generated. It is apparent that GBV, especially

intimate partner violence (IPV), is far reaching in Jordanian society. Most raw data available are derived from records of organizations that provide services for victims and from interviews of representative samples of society, which inform researchers on social attitudes and general public awareness relating to the topic (United Nations Women Watch 2008).

Violence against women is a global, social, and health problem in many societies and cultures. In Jordan, IPV is considered a private matter, one in which outsiders should not be involved. It is rarely discussed outside of the kin group, as doing so would bring shame and dishonor and damage the family's reputation (Hamdan-Mansour et al. 2011, 266). GBV is not viewed as a community, social, or legal issue, and many Jordanians believe it is best resolved at home. However, GBV is not easily mitigated without education, protection for survivors, and legal consequences for abusers.

A woman who does report violence is at an increased risk for being ostracized from her family and being labeled as a rebellious and disobedient wife or daughter who is not properly taking care of her family and children. In several studies, it is evident that many Jordanians, male and female, still believe violence toward a woman is often justified and can be productive, signifying that victim blaming remains a significant problem. However, these views tend to be significantly higher in refugee camps and poorer communities (Al-Nasour et al. 2009, 569). These social attitudes, which greatly affect a woman's reputation, often prohibit them from seeking help from local organizations and serve to silence their experiences. While limited, several organizations in Jordan seek to educate local communities about healthy relationships. For example, Ruwwad, a community empowerment-based organization in Amman, recently conducted a Safe Homes campaign to educate families about healthy relationships.

While IPV is prevalent in Jordanian society, the kingdom is lacking in nationwide data based on consistent measurement methods. Additionally, there are almost no studies on other GBV issues, such as sex trafficking or prostitution. Honor crimes are also reported, though numbers have dropped due to awareness and educational initiatives (United Nations Women Watch, 2008). Activists believe the kingdom must better address this topic to prevent further violence against women, not only through legal protection and increased services for women but also through campaigns that stimulate dialogue within communities. Community support and destigmatizing the issue are critical for the health and safety of women.

Sexual Harassment

Women in Jordan, foreign or local, are keenly aware of the ways sexual harassment is pervasive in Jordanian society. Recently, women have been documenting their experiences with sexual harassment in Jordan in the form of blogs, YouTube videos, and other social media. In fact, for a woman living in Jordan, it is expected that she will be harassed anytime she leaves her home. Sexual harassment is instigated by men of all ages and professions. It is not uncommon for women to be sexually harassed by police officers and military personnel, which makes women feel even less safe because there is no one to take their reports seriously (Nicky 2012; Julie 2013).

Sexual harassment happens when women are catcalled while walking down the street, which includes phrases like "you're beautiful," "oooo *mashAllah*," and hissing sounds. It also happens when taxi drivers ask women to marry them and solicit them for sex (Whitman 2014). Many women also report being groped in public. When confronted about this behavior, the men play innocent. Sexual harassment happens to both foreign and local women as well as women in all types of dress. Many women report wearing the hijab or traditional abaya and still experiencing harassment.

One notable woman, Rula Quawasa, a former professor and dean of the faculty of foreign languages at Jordan University, was recently fired for showing a film students had produced that addresses sexual harassment. The film was shown in the university's feminist theory class, and it is argued that the film tarnished the university's reputation. The film was shared across social media outlets in Jordan and in local news. Critics claim the film undermines Jordan's progress in education (Lavalée-Belanger 2012). Sexual harassment is still considered a taboo subject, and some believe it should not be exposed to the world, as it is shameful. However, Jordanian women are refusing to stay silent.

Antiharassment campaigns have flourished on social media throughout Arab countries, but despite increased awareness, this has resulted in little policy change or protection for women. The gender statistics at the head of the Jordanian Department of Statistics confirm that they have no formal studies on sexual harassment. Therefore, it is hard to create policy change without any quantifiable data for support (Whitman 2014).

Safety of Syrian Women Refugees

Jordan's political stability and shared borders with four other Arab states make it a safe haven for refugees from

several neighboring countries. Despite limited natural resources, Jordan continues to provide asylum for numerous Syrians, Iraqis, Palestinians, and others. As of February 2014, nearly 600,000 Syrian refugees have been registered in Jordan by the United Nations. More than 80,000 of these reside in the Zaatari camp of northern Jordan. Zaatari is now the fourth-largest city in Jordan and the second-largest refugee camp in the world (Migration Policy Center 2014.). Moving from a war-torn country and into a refugee camp places new social anxiety on refugees, particularly women and girls. Not only are people living in small, overcrowded spaces with resources limited, but they are increasingly at risk for gender-based violence.

A number of aid workers with women's rights groups and Amnesty International have reported that women and girls are increasingly targets of harassment, sexual assault, and early forced marriages. Such insecurity in the camp is of great concern, and these issues are exacerbated by circumstantial difficulties. For example, the camp utilizes communal toilets, many of which are unlit due to theft. Thus, women and girls are instructed by men not to use the toilets after 10:00 p.m., when it is dark. They fear that they will be harassed and attacked, potentially resulting in serious health consequences. The incidence of urinary tract infections is high among women and girls in the camp, which has been confirmed by doctors working there (Amnesty International 2014).

As refugee numbers continue to rise, individuals and aid workers have been urging the Ministry of Interior to enhance women's and girls' safety for all public spaces in the camp, to prevent vandalism of such spaces, and to implement more security-enhancing measures.

Domestic Labor: Housemaids

The Arabian Gulf states have been attracting foreign labor since the early 1970s. In more recent years, the demand in Jordan has intensified, attracting female migrant workers from Sri Lanka, the Philippines, and Malaysia. It is estimated that at least 1 in 11 Jordanian families employ a housemaid; employing a maid is a marker of elite social status (Frantz 2008, 611). A large part of this demand stems from the fact that the work conditions of foreign domestic laborers are typically favorable for employers, especially when a worker's situation is within the first of three cohorts that domestic workers fall under. These circumstances reveal much about power dynamics in Jordanian society and how work is gendered.

The Arab world has developed a system for employing foreign workers through the *Kafala* (sponsorship) system, which facilitates the hiring process and is based on temporary contracts. A foreign worker is matched with a sponsor, or *kafeel*, to obtain the entry visa, residence, and work permit. This means that a sponsor assumes full legal and financial responsibility of the foreign worker, holding onto her passport and other legal documents until the contract has finished, which creates a hierarchy between worker and employer. This system restricts the workforce because domestic labor is considered within the private sphere, prohibiting government regulation. Therefore, there is no legal recourse for these workers if there is a discrepancy between them and their employers regarding wages or maltreatment. The labor laws also exclude noncitizens from forming or joining unions (Frantz 2008, 610).

Domestic workers in Jordan differ based on length of contract and place of residence. Workers who have a limited stay in the country on one- or two-year contracts reside in their employers' homes, with strict rules dictating how much interaction they have with others outside of the family. The majority of them are not allowed outside without being accompanied by a family member, and such trips are only for running errands or social gatherings at the homes of the employers' family or friends (Namati 2014). Strict rules about mobility and a standard of obedience and faithfulness to the employers are rationalized through the concept of fictive kinship, where employers call their domestic workers "daughter" and expect to be addressed as "mama" or "baba" in exchange for material benefits (Frantz 2008, 627).

The second cohort consists of workers who have longer contracts, sometimes 20 years or more, in which domestic workers have been awarded more privileges and trust. They are usually fluent in Arabic or English and are given a full day's rest, along with other social allowances. They often form friendships with other workers in the same situation, but they rarely engage in conjugal relationships due to reputation and notions of female modesty, which are still extended to foreign maids.

The third cohort consists of female workers who have been in Jordan for many years and reside independently. Though they lack the consistency of full-time work, they can earn up to two-thirds more than those in the first cohort and have far more mobility (Frantz 2008, 622–623).

The normality of employing a housemaid among Jordanian families showcases how domestic work is still gendered and undervalued, yet expected to be done by women. As more women are pursuing higher education and

working, there is less time for women to complete household duties. Further, the emphasis on education in Jordan and the rise of the nuclear family make parents more likely to insist that their children study rather than help with domestic responsibilities. Prior to this rise in education, more women completed housework, and more children helped around the house. However, this change in priorities has not been met with husbands and fathers offering to assist more in the home. Instead, women are likely to employ a maid out of her own earnings, as it is considered her responsibility to maintain the home, not the husband's, even if both spouses are employed or involved in activities outside the home (Frantz 2008, 616–617).

While Jordan prides itself on a new reform, supported by the UN Development Fund for Women (UNIFEM), to protect the rights of workers, there has been little improvement. After being introduced by the kingdom in 2003, the contract would prevent employers from withholding salaries; guarantee more rights, such as days off and maximum hours of work per week; and provide access to personal documents. However, there is no law to support this reform; therefore, it is rarely enforced. In fact, most domestic workers are unaware of this reform, and their rights to salaries and time off continue to be violated (Namati 2014).

Social attitudes in Jordan regarding gender and domestic workers as well as barriers to legal protection continue to leave this population vulnerable. As many foreign women workers lack local language skills and local social networks to provide support, they face marginalization. They are an incredibly vulnerable part of the population, and crimes against these women are typically treated with less seriousness.

K

Kenya

Overview of Country

The Republic of Kenya is a coastal country located in East Africa that neighbors Somalia, Ethiopia, Sudan, Uganda, and Tanzania. Kenya is divided into north and south by the equator, and the tectonic plate boundary of the East African Rift divides the country into east and west. Covering an area of over 590,000 square kilometers, Kenya is the 49th largest country in the world. The country boasts a diverse climate; it is tropical in the south, west, and central regions, and the north and northeast regions are arid and semiarid. Terrain ranges from low coastal plains on the Indian Ocean, to mountain ridges and plateaus in the center of the country that rise 3,000 meters above sea level, to arid plains in the north, to highlands in the south. Forty-eight percent of the country is agricultural land, but only 9 percent is arable, meaning suitable for growing crops. The remainder is permanent pasture or forest. Kenya is divided into 47 counties.

The majority of Kenya's 40 million people live in the rural areas surrounding the African Rift Valley, where most arable land is situated. Also in this area is Nairobi, the country's capital city, with a population of nearly 4 million people. Nearly 42 percent of Kenya's population is under the age of 15, with a median age of 19 years old (WHO 2014). This skewed population distribution is due in part

to previously high population growth rates and impacts from the country's recent HIV and AIDS epidemic. As a result, Kenya is burdened with a high dependency ratio—primarily youths who are dependent on a small proportion of people participating in income-generating activities. This places increased demands on a household's income and subsequently reduces opportunities for savings and contributes to poverty.

Kenya's population is ethnically and religiously diverse. Ethnicity and religion are an important part of Kenyan society historically and presently, shaping the social, cultural, political, and even economic fabric of the country. Kenya's official languages are Kiswahili and English. Ethnic languages are also still widely spoken.

Colonial Roots

Kenya's present socioeconomic status is deeply influenced by its colonial roots. In pursuit of economic interests in fertile farmland, the British government founded the East African Protectorate, or British East Africa, in 1895, which encompassed the area of present-day Kenya. At this time, the settlement and development of fertile farmland in the Great Rift Valley by the British began. By 1920, the area was officially annexed and deemed a British colony; the British assumed full control and banned African and Asian Kenyans from political participation until 1944. A large Indian community developed at this time when the

British brought in Indian workers for railway construction projects. To attract settlers to the new Colony of Kenya, the most fertile farmland was alienated for European settlement and crop export production.

African populations were dispossessed of their land, forcibly removed, and relocated to native reserves. Africans were forced into labor on British-owned plantations and ranches or were otherwise “forced” into this work by prohibitions on the cultivation of cash crops on reserves to ensure adequate labor supply was available for British enterprises, both in agriculture and otherwise. Only Africans in possession of work permits were permitted to travel outside of the reserve, and in most circumstances, work permits were only issued to men. This left women and children on the reserves to engage in subsistence activities, while men engaged in cash-earning employment outside the reserves. Beyond earning income, this allowed men to receive experience, training, and education in the modern British system, while women were limited to traditional languages, skills, and technology for their livelihoods.

Considerable tension and conflict eventually mounted into resistance movements against the colonial powers. The Mau Mau movement commenced in 1942 and resulted in a statewide decade-long state of emergency. By 1963, the Republic of Kenya had gained independence. The effects of colonization and the cultural dynamic created by this way of life persist to this day, long after the removal of the legal and political structures that enacted them. The impact of property rights and gender divisions within the home and work are inextricably linked to these historical experiences and shape the everyday lives of Kenyan women.

Human Development and Poverty

Despite its recent economic progress, Kenya still struggles with human development and poverty. UN Development Programme (UNDP) statistics place Kenya’s poverty rate at 45.5 percent (UNDP 2016). In 2014, Kenya ranked 145 globally with a Human Development Index (HDI) of 0.548, and it is considered to have low human development. When consideration for gender is taken, Kenya’s Gender Development Index (GDI) shows that the HDI for the female population is 0.913 as a percentage of the male HDI. Kenya scores above the regional average for sub-Saharan Africa. When gender inequality is accounted for in the Gender Inequality Index (GII) measure, Kenya ranks 126th globally with a score of 0.552, which is slightly ahead of the regional average. When making comparisons to regional

averages, it is important to note that sub-Saharan Africa has some of the highest levels of poverty and inequality in the world.

Similar to many other developing nations, poverty in Kenya is multidimensional. This means that people suffer from multiple overlapping dimensions of deprivation at the same time, which further compounds and amplifies issues of poverty. Regionally, poverty is most severe in the northeast, with the least poverty in the central province and Nairobi (OPHDI 2016). This is in line with the general trend that poverty is worse in rural areas, with the exception of urban informal settlements, or slums. Overall there is less poverty in Kenya in comparison to other countries in Africa, but poverty is still a major issue that impacts the lives of women and girls. In a study of multidimensional poverty of women in sub-Saharan Africa, Batana et al. (2013) found that Kenyan women suffer more from a lack of empowerment, as reflected in household decision making, and a lack of assets and access to services than from nutritional deficiencies or a lack of education, which can be more pervasive in other countries. Poverty is an omnipresent, pervasive issue in the lives of women and girls in Kenya.

Gender inequality needs be considered in light of historical factors and sociocultural settings, both within and across geographical areas of the country. Disparities are often compounded by the other factors, making inequalities multidimensional and intersectional.

Education

A wicked cycle of entrenched poverty is perpetuated by a lack of gender equality in education: women who are uneducated give rise to future generations of girls who will likely be less educated, or even uneducated. This correlation and causality does not exist to the same extent for males.

Kenya’s education system is based on an 8-4-4 system. Primary school is compulsory; it begins at age six and lasts for eight years. The majority of primary schools in Kenya are public and government funded, with standardized curriculum across the country. In 2003, the Kenyan government implemented free primary education nationwide, resulting in a near 40 percent increase in the number of children attending and completing a primary education. Despite this progress, Kenya still ranks as the ninth-worst country globally for primary education participation. UNICEF data indicate that 84.5 percent of Kenyan girls are

enrolled in primary school, and 75 percent are attending (UNICEF 2016). This is at parity with Kenyan boys' primary school enrollment and attendance rates. At the end of the eight years of primary education, students sit for exams that determine whether they are to pursue secondary or technical schools.

Secondary school begins at age 14 and last for four years, but unlike primary school, it is not compulsory. In 2008, the Kenyan government implemented nationwide free education at the secondary level. Coupled with increased numbers of students completing primary education, this resulted in a drastic increase in the number of students pursuing secondary education.

Gender inequality is more present at the secondary level, with slightly fewer females than males both enrolling and attending. Female enrollment in secondary school is at 48.4 percent, and attendance is at 41.6 percent (UNICEF 2016). Upon the completion of secondary education, students sit for exams once again to determine their opportunities for postsecondary, or they enter the labor force. Unfortunately, a large number of students who enter secondary school are unable to complete their studies. Girls are less likely to complete their entire secondary education due to financial restrictions, responsibilities at home, and a perceived lack of importance.

Postsecondary education in Kenya can be pursued through university or nonuniversity streams. Enrollment in universities across Kenya more than doubled between 2012 and 2014. When women do not pursue postsecondary education, their upward mobility in the workforce is limited, as this makes it difficult for them to secure leadership or decision-making positions. Gender disparity is substantial in Kenya's postsecondary education system. In some areas, there is little gender disparity; primary teacher training programs see more female enrollment than men, which is in part due to cultural perceptions of teaching as a profession suited to women (Njeru 2003). Other fields, namely STEM sectors (science, technology, engineering, and math), are considerably catered to males, both in terms of cognitive and pedagogical approach. There are culturally entrenched perceptions that STEM careers and education are less suitable for females (Njeru 2003). This is also very much the case for technical and vocational schools.

There is also evidence of gender inequality when examining enrollment at public versus private institutions. Public universities in Kenya have more competitive admissions and are only a fraction of the cost of private institutions,

making them the more desirable option for most postsecondary students. Males have much higher enrollment rates at public universities, while females occupy more spaces at private universities (Onsongo 2006). In many circumstances, females cannot compete for entry with males, who typically obtain higher exam marks, because subjects offered at most public universities cater to STEM fields. Private institutions offer more programs in the social sciences and humanities. Cost is also more of a barrier for females than it is males in the pursuit of postsecondary education.

Quality

Considerable variation in the quality of education negatively impacts Kenya's education system. When comparing performance on exams for secondary school entry, 77 percent of students qualified from the private school sector, while only 45 percent did so from the public school sector. This performance gap is further layered with gender inequality, as boys are more likely to score higher on these exams than girls (Njeru 2003). This performance gap is reflective of differences with facilities, teachers, other resources, and the level of academic preparation by students, among students' personal performance-related factors.

Barriers to Women's Education

The Kenyan government and people recognize that the education of women and girls is critical for development and poverty reduction. In recent years, considerable improvements have been made to Kenya's education system as a whole and to improving education for women and girls at all levels. This is complex, and barriers to achieving gender parity in Kenya's educational system persist.

The effects of poverty on females' lives negatively impacts their educational access, attainment, and achievement. Health impacts resulting from poverty often make it challenging for women to pursue an education. Women's increased vulnerability to disease, particularly in the face of poverty, intensifies its effect on women's education. Though steps have been taken to decrease the financial burden of pursuing an education in Kenya, cost can still be a barrier; many families cannot afford ancillary fees, including those for uniforms, or the cost of travel to school. When issues of cost arrive and families do not have enough money to send all of their children to school, they will often prioritize boys' education over girls'. There is a

perception that a boy will contribute to the future wealth of the family, while a girl will only contribute to the future wealth of her husband's family. When considering opportunity cost, there is also a perception of limited earning potential for girls, further prioritizing boys education over girls in this situation.

Traditional cultural practices, including early marriage, are also a persistent barrier in the education of females. Gender boundaries in Kenya traditionally do not favor females working outside of the home. Given these boundaries, the emphasis for educational attainment and gender equality maintains a focus on basic education (Onsongo 2006). Women's education is also impacted by gender insensitivities reflected in teaching practices, curriculum, management, and environments that serve to disaffect and disempower females (Chege and Sifuna 2006). Generally, the barriers that impact women's education are more problematic in rural and low-income areas, including the North Eastern Province and areas of the Coast Province. The urban poor also face immense challenges.

Health

Enabling a healthy society and providing adequate health care to Kenya's citizens, particularly women and girls, has been a great challenge for the country. Kenya is burdened with high rates of infectious disease and, increasingly, chronic disease, and it has limited capacity within its health care system to address these needs. Improving health care and the lives of its citizens has been prioritized in Kenya since achieving independence, but it experienced notable setbacks during its economic hardships of the 1980s and the HIV/AIDS epidemic that began in 1990s. Life expectancy in Kenya reached a low of 45 years in the 1990s, but it has since risen to 61 years for the total population and 63 years for females, which is slightly higher than the regional average for Africa (WHO 2015).

Maternal and child health, HIV/AIDS, malaria, and tuberculosis have for the past two decades together have constituted Kenya's most substantial health problems and caused the greatest burdens of disease (WHO 2015). Like many other nations of the Global South generally and Africa specifically, Kenya is particularly at risk for a number of reasons. High levels of poverty with accompanying lack of access to infrastructure and education, malnutrition, and high population growth rates contribute to disease rates. The presence of a large number of water bodies leads to high rates of waterborne and mosquito-carried diseases.

Cultural and religious influences on sexual and reproductive health are factors of major influence. These are further complicated by persistent issues with governance and corruption, both within and beyond the health sector.

Kenya's health care system is divided between public-, private-, and civil-sector service providers and institutions. Health care facilities consist of community health units, clinics, centers, and hospitals, each offering different levels of service. Critical challenges within Kenya's health care system affect access to and quality of services.

Access to Health Care

Access to health care for all citizens is a constitutional right in Kenya. It is complicated by the limited number, capacity, and spatial distribution of facilities and health care personnel, in addition to the burden of cost both at the health care system and family levels. The distance to health care facilities dictates the time required to access services, delays in seeking treatment, increased cost of treatment, and opportunity costs resulting from time spent away from livelihoods while pursuing treatment. The global goal is to limit travel time to health care facilities to one hour or less. In recent studies, it is estimated that only 63 percent of Kenyans are within one-hour access of health care facilities (Noor et al. 2006). This is even more problematic in rural areas, where reports of women walking in excess of two to three hours with their children to access health facilities is common. This not only impacts health but also women's livelihoods and ability to work or go to school.

When Kenyans are able to access facilities, there are often discrepancies between needs and the availability of services provided by facilities. Less than 60 percent of Kenya's health care facilities offer all basic services, and less than 20 percent offer 24-hour service access and care by a qualified health professional. When necessary services are offered, further complications result from capacity. In Kenya, there are only 1.4 health care facility beds per 1,000 people and only 160 trained health care professionals per 100,000 people. Health care access has had a considerable impact on the lives of Kenyan women and children. In 1993, Kenya's coverage of full immunization for children was 78 percent, but due to burdens on the health care system, in part due to rapid population growth, this dropped below 60 percent in 2003 (Muga et al. 2005). This is particularly representative of the magnitude of this problem, as immunizations are one of the easiest and most efficient health care interventions.

Access is not simply a health system or service provision issue; it is also affected by socioeconomic variables. In addition to disparity due to cost, men are more likely to have multiple visits to hospitals for HIV/AIDS care, while women commonly only visit a hospital once, often close to death, because of the cost and the duty to continue caring for family at home while their husbands work (Opiyo et al. 2008). The patriarchal nature of the community together with the predominant male control of property, general household finances, and decision-making expectations further exacerbate the position of women and their ability to access specialized treatment and have control over their lives.

Quality

Quality of health care service in Kenya is also a concern. It is negatively influenced by inadequate facilities, equipment, and supplies and system-wide inefficiencies, which are widespread issues due to resource limitations. This is becoming increasingly problematic as the prevalence of cancer and heart and lung disease increase. The equipment needed for diagnostics (i.e., MRI) and treatment (i.e., surgery) of these diseases are expensive and resource intensive. When patients are able to access diagnostic services, it is not uncommon to receive a diagnosis but be unable to receive treatment. This results from both limitations within the health care system and family situations. Inefficiencies in Kenya's health care system also impact the quality of services.

Sexual and Reproductive Health

Sexual and reproductive health includes women's and girls' ability to have safe and satisfying sex lives and autonomy over their reproduction, including the capability to reproduce and the freedom to decide if, when, and how often to do so. To be healthy, women and girls need access to information and appropriate contraceptives, empowerment in their relationships and in society as a whole, and legal protections. Some of the biggest and most contentious sexual and reproductive health issues for women and girls in Kenya surround HIV/AIDS and family planning. Pervasive gender inequality and sociocultural norms are at the heart of each of these concerns.

HIV/AIDS

HIV/AIDS is the leading cause of death in Kenya and is a major cause of morbidity as well. This has been the

case since the spread of the sub-Saharan African HIV/AIDS epidemic that began in the early to mid 1990s. As of 2015, UNAIDS estimates that there are more than 1.5 million Kenyans living with AIDS (6% of the adult population), and over 36,000 AIDS-related deaths and 78,000 new infections each year. Prevalence is slightly higher in urban areas and is significantly higher in Nyanza Province in southwestern Kenya (UNAIDS 2015). Despite being free of charge in most cases, only 59 percent of infected adults are on antiretroviral therapy (ART) (UNAIDS 2015). Without adequate and continued treatment, AIDS-related premature death is a certainty, and the risk of spreading the infection is also much greater.

The impact of HIV/AIDS in Kenya has been detrimental not only to population health and health care systems, but also to society and its economy more broadly. The bulk of this burden and impact has fallen on Kenyan women and girls. Nearly 60 percent of HIV/AIDS-infected persons in Kenya are female. Women between the ages of 15 to 24 have prevalence rates four to six times higher than males of the same age, and they account for 21 percent of all new infections (UNAIDS 2015). Reasons for this are multifold and complex. Physically, females are more susceptible to infection than males, but this alone is not the explanation. The root cause is amplified by a number of sociocultural variables, including the fact that many young women may be child brides, have older male sexual partners, or engage in transactional sex to support themselves, all of which are scenarios in which women often have limited power to negotiate condom use for protection.

Women and girls are subjected to higher rates of rape and sexual violence. Sex workers are also at higher risk for HIV/AIDS infection. The prevalence of HIV within Kenya's female sex worker populations is over 29 percent, the highest of any group in the country, which demonstrates the dire situation for new infection rates for women because sex workers are also the most likely to take preventative actions and seek testing and treatment (KNACC 2014). Beyond these specific scenarios, gender inequality and poverty in Kenyan society contribute to the burden women and girls face from HIV/AIDS. The levels of educational attainment, income, and relative poverty status are all inversely connected to HIV/AIDS occurrence, and disparity in access to health care for women exacerbates this.

Though the HIV/AIDS epidemic remains a major threat to Kenyan society, particularly women and girls, considerable progress in addressing this has been made. Prevalence has nearly been cut in half since its peak of over 10

percent in 1995. The scale-up of antiviral treatment has stabilized the epidemic, with AIDS-related deaths decreasing nearly 68 percent since 2009. Coverage of antiretroviral treatment for adults increased by 14 percent from 2008 to 2013, and it increased for children by a substantial 27 percent over that same time frame. Considerable progress has been made in the reduction of mother-to-child-transmission, which was nearly halved from 2010 to 2015 (UNAIDS 2015).

Kenya's success has been due in part to standard interventions such as HIV testing and counseling, scale-up of antiretroviral treatment programs, free condom distribution, education and awareness initiatives, and voluntary medical male circumcision campaigns, in addition to some more progressive and innovative measures. In 2015, Kenya implemented progressive legislation requiring the disclosure of HIV status to partners, and in 2016, Kenya became only the second country in sub-Saharan Africa to approve the use of pre-exposure prophylaxis (PrEP), in which antiretroviral drugs are taken by HIV-negative persons for protection from possible exposure, an intervention that is targeted at high-risk young women and sex workers (UNAIDS 2015).

The impact of HIV/AIDS on Kenyan women is not limited to those infected or at risk of infection; it also impacts the lives of women who become single parents, caregivers for infected family members, and orphaned and vulnerable children. Home care for HIV/AIDS treatment is common in Kenya. Women account for two-thirds of all AIDS caregivers, with one-quarter of these women over the age of 60 (UNAIDS 2015). It is not uncommon for women, particularly younger women and girls, to be both AIDS caregivers and infected themselves. The provision of AIDS care can last from months to years, and it commonly includes providing emotional, physical, and nursing care to those infected along with assuming greater responsibility for household duties (UNAIDS 2015). This is unpaid work and limits the time and resources that women and girls could otherwise spend on education, income-generating activity, and self-care.

Though most Kenyan women are happy to care for their family members, there are considerable physical, emotional, and economic costs to these women and their households. As a result of AIDS-related deaths, as of 2015, there are over 660,000 orphaned and vulnerable children in Kenya (UNAIDS 2015). The majority of orphaned and vulnerable children are cared for by grandmothers, or their families become child-headed households, most

commonly headed by girls. The results are increased costs and burden of care on grandmothers and psychosocial issues for children, along with increased poverty and decreased attendance at school.

HIV/AIDS is easily one of the biggest issues for Kenyan women and girls, on both the societal and individual levels. Females are disproportionately impacted by this disease and the epidemic, but women and girls show incredible resilience to persevere and progress despite these challenges. The epidemic will continue to affect the lives of women and girls in Kenya and across sub-Saharan Africa for generations to come.

Family Planning

Family planning is critical for women's health and well-being. When women are able to properly plan their families, they are able to more effectively participate in education and the workforce and are more empowered and suffer reduced health impacts from inadequately spaced pregnancies. Of all sexually active women in Kenya, 73 percent have used contraception at least once. Fifty-eight percent of married women currently use contraceptives, while only one-third of unmarried women use contraceptives (APHRC 2014; KNBS 2015). Some women in Kenya have used traditional contraceptive methods that are largely ineffective, but the use of modern contraceptives has increased more than 21 percent since 2003 (KNBS 2015). Currently, only 63 percent of the demand for family planning services in Kenya is satisfied (APHRC 2014). Kenyan women have high awareness and knowledge of family planning and contraceptives; therefore, this gap in services is likely due to a lack of access.

Maternal, Newborn, and Child Health

Maternal, newborn, and child health (MNCH) is a challenge in Kenya. Every two hours, one woman in Kenya dies from pregnancy- or childbirth-related causes (UNICEF 2016; WHO 2014). MNCH-related morbidity and mortality can be connected to prenatal care, childbirth practices, postpartum practices, breastfeeding, nutrition, and other health concerns, including infectious disease. MNCH is an important aspect of health and health care, as it can have long-term effects on child growth and development.

Prenatal care can have a substantial impact on a woman and her child's health. A study by Awiti (2014) found that the prenatal care a woman in Kenya receives is influenced by a number of factors that include the mother's age at

birth, level of education, and income, along with the number of facilities available and the distance to facilities. In 2014, 96 percent of pregnant women in Kenya received some amount of prenatal care, while only 47 percent had the recommended minimum of four visits throughout her pregnancy (MOH 2016).

Giving birth in proper health care facilities and being under the care of a skilled birth attendant are critical for the survival and health of both mother and child. Women's childbirth experiences in Kenya vary widely. In Nairobi, for wealthier women and those with insurance, the childbirth process and experience can be similar to that of any Western country. However, the majority of women are not afforded this luxury. In urban areas, 75 percent of Kenyan mothers deliver their babies under the care of skilled birth attendants, but this only reaches 37 percent in rural areas (Phiri et al. 2014). Factors that influence whether a Kenyan woman gives birth in a health care facility and with a skilled birth attendant include access to care, affordability, and the perception of whether or not doing so is necessary—all of which are heavily influenced by the woman's level of educational attainment and economic status. If a woman does not give birth in a health care facility with skilled birth attendants, she usually gives birth at home, or sometimes even en route to the hospital, and is tended to by friends or family, traditional birth attendants, or she may be alone. Lack of proper facilities and care during birth contributes to Kenya being one of the most dangerous countries in the world for a woman to give birth, which is reflected in its high maternal mortality rate of 360 deaths per 100,000 live births (MOH 2016). Restrictive abortion legislation also contributes to maternal mortality in Kenya (Ziraba et al. 2015). Abortion is only legal when medically necessary, but instances of illegal abortion are common.

Postpartum care is also critical for the health of both the mother and child. This is another area of MNCH that Kenya struggles with. Most women who give birth in a health care setting receive some amount of postpartum care for themselves and their child, but often not to the extent that is needed, both in the first few hours following birth and in the weeks following. In total, 47 percent of Kenyan women receive some amount of postnatal care (Akunga et al. 2014), but for women who deliver outside of a health care facility, 81 percent do not receive postpartum care.

Kenya has a positive culture around breastfeeding and has made considerable progress with this in recent years, particularly in comparison to other sub-Saharan African

countries. Recent studies report that the number of women exclusively breastfeeding for the first six months has doubled from 2008 to 2015 (Wanjohi et al. 2017). This significantly reduces infant mortality, protects against infection and disease, and provides optimal nutrition for growth. A woman's choice to breastfeed is influenced by her knowledge of breastfeeding; her overall educational attainment; environmental factors, such as having adequate space for breastfeeding at work; and sociocultural perceptions. There is still some cultural stigma over breastfeeding in Kenya, ranging from a belief that breasts will sag to curses that may result from breastfeeding (Wanjohi et al. 2017). Despite this stigma, Kenya has made considerable progress on this important dimension of women's and children's health.

Kenya's under-5 mortality rate is 49 per 1,000 live births (KNBS 2015). More than 7 million children under the age of five die each year in Kenya, primarily from preventable or treatable causes. The main causes of under-5 mortality in Kenya are neonatal complications from birth, diarrheal diseases, pneumonia, and HIV/AIDS, with undernutrition contributing to over one-third of child deaths (UNICEF 2016; WHO 2014). This follows the same pattern as other dimensions of inequality in Kenya; child mortality rates are higher in rural areas and informal urban settlements and are heavily influenced by socioeconomic status. Simple and inexpensive interventions, such as rehydration salts and practices to prevent mother-to-child transmission of HIV/AIDS during delivery, can make a big difference in child mortality, but Kenya's strained health system struggles to provide such interventions for mothers and children in need.

In Kenya, a total of 79 percent of children aged 12–23 months have received full vaccination coverage, and only 2 percent of children have not received any vaccines (KNBS 2015). There is gender parity with child vaccinations in Kenya. The limited extent of vaccinations is problematic, given that vaccines are critical for child and population health; they are some of the easiest and most inexpensive health interventions that can be given. When children in Kenya get sick with an acute respiratory infection, fever, or diarrhea, they are given formal health care in only 60 percent of cases because of difficulties affording and accessing health care in Kenya. Eleven percent of Kenyan children are underweight, and a further 4 percent are wasted and 5 percent stunted. Only 22 percent of children in the country are fed in accordance with proper practices (KNBS 2015).

Employment

Employment is one of the main ways in which women can improve their level of living and well-being. Given that Kenyan women suffer more at the hands of poverty and inequality than men, employment is critical for women's livelihoods. Unemployment and underemployment are one of Kenya's most difficult and persistent problems.

Women's Labor Force Participation

Employment in Kenya consists of formal and informal paid work and unpaid work. The formal sector includes public and private enterprises that are registered and taxed, while the informal sector, called *jua kali*, includes small private and unregistered businesses. Unpaid work includes economically inactive reproductive or household work, including subsistence agriculture. As of 2014, 75 percent of adult Kenyan women held some form of employment, while 99 percent of adult Kenyan men were employed (KNBS 2015). Nearly 47 percent of Kenya's labor force is adult females (World Bank 2016). Unemployment and underemployment is a critical long-standing issue in Kenya. The unemployment rate for women is nearly 11 percent, while it is only 8 percent for men (Moyi 2013).

Women's work is largely relegated to informal and unpaid activities. This pattern has persisted since the introduction of structural economic reforms in the 1980s. Work in the informal sector is characterized by high levels of insecurity, safety issues, and low wages. However, women may choose to work in the informal sector because of its flexibility and part-time hours, which may be necessary given her household's demands. Average wages in Kenya's formal sector are approximately twice that of the informal sector and four times those in subsistence agriculture. Women account for slightly less than one-third of Kenya's formal work sector (Wamuthenya 2010). Women that work in the formal sector are often expected to pursue careers in female-oriented fields, such as teaching and nursing, due to cultural perceptions. Increasingly, women are being employed in casual, temporary, part-time, and contract jobs across Kenya, which reduces their earning potential and income security. Women's work is predominantly in agriculture, trade (buying and selling), the service sector, and domestic labor. Women in rural areas are more likely to work in the informal sector and subsistence agriculture. Women in urban areas have greater opportunity for other employment given that cities are economic

hubs. In total, 14 percent of all employed women in urban areas are domestic workers (Kaane 2014).

Women's participation in Kenya's labor force is influenced by their socioeconomics, cultural values, household characteristics, and personal choice. Variables affecting this include a woman's age, level of education, marital status, religion, ethnicity, household headship, number and age of children, husband's employment, and size of household and whether there are other female relatives in the home. Women from more traditional, conservative, and patriarchal groups, including Muslims and those practicing various traditional African religions, and those from Somali and Masai tribes have higher unemployment rates and are less likely to engage in work outside the home or family environment (De Giusti and Kambhampati 2016).

Employment can have a considerable impact on women's lives. It can help improve her family's welfare and reduce poverty, while also empowering her within her home and community. Employment improves women's bargaining power within the home by shifting her income share, affording her higher status within her household (De Giusti and Kambhampati 2016).

Discrimination, Equity, and Pay

The 2010 constitution and various other pieces of legislation also protect against workplace discrimination due to pregnancy, religion, ethnicity, disability, or age. Women's rights are further protected in the workplace through Kenya's progressive maternity leave requirement for employers to provide women with three months of paid maternity leave and men two weeks of paid paternity leave. Employers are also required to provide space and time for women to breastfeed at work.

Despite efforts to address gender inequality in Kenya's labor force, disparities persist. Trends indicate gradual improvement, but Kenyan women are still significantly underrepresented in senior official, management, and leadership roles within both the public and private sectors. An approximate 35 percent gender wage gap exists in Kenya. Despite the fact that women work more hours than men, they are often paid less. Reasons for this may include differing levels of education and experience or blatant gender discrimination. Pay inequality exists at both the top of the wage distribution, where women suffer from the "glass ceiling" limiting their upward wage mobility, and at the bottom, where women suffer from the "sticky

floor” phenomenon, which keeps women held down to low wages (Agesa et al. 2013). Women are also subjected to workplace harassment as a result of Kenya’s patriarchal society.

Child Labor

The sub-Saharan Africa region has the highest rates of child labor in the world. Regrettably, Kenya does not differ from its neighbors. The minimum legal age for work in Kenya is 16, but many youth and children engage in child labor. When unpaid labor is accounted for, more than 32 percent of Kenyan children under the age of 16 are both working and attending school, and 32 percent only work (DOL 2015). Children in rural areas are more likely to both work and attend school. These children engage in the agriculture, industry, and service sectors and are primarily driven to do so because of poverty or because one or both of their parents also worked as a child. Child labor is characterized by low wages, long hours, and abuse. Even if their work does not prevent children from attending school, this work often has a negative impact on their school performance. On average, girls work more than 35 hours per week, primarily by performing unpaid family work (Moyi 2011).

When girls do engage in paid work, it is most commonly commercial sex work. More than 50,000 girls in Kenya are estimated to be working in the commercial sex trade, which is largely fueled by male tourists from Western countries (NCCS 2013). This has pervasive physical and psychological impacts on girls and is a gross violation of their human rights. The Kenyan government and international community have attempted to address child labor through such incentives as free schooling and cash transfer incentive programs. Child sex work has primarily been addressed through building education and awareness, increasing child protection, and legislation.

Family Life

Family is an important social institution in Kenya. Families in Kenya still hold many traditional values and practices, but these have modernized alongside society as a whole. Families tend to be large and maintain close relations with extended family. The average number of people per household in Kenya is 4.3, with only 1.8 rooms in the home (APHRC 2014). Due to Kenya’s conservative traditional values, it is not common for unmarried women to

live with men in domestic partnerships. Women typically stay living in their family home until marriage.

Marriage

The average age at first marriage for Kenyan women is 20 years old (KNBS 2015). Muslim women tend to marry one year earlier, and Luo women marry one to three years earlier (APHRC 2014). Of adult Kenyan women, 60 percent are married (KNBS 2015). Kenya has civil, religious, and customary marriages. Given the importance of religion within Kenya, most marriages are religious.

LGBTI Marriage

Same-sex unions are neither legal nor socially acceptable in Kenya. Some estimates suggest that 90 percent of the Kenyan population is against homosexuality (DIHR 2016). Because of this stigma, most LGBTI Kenyans get married to or engage in sexual relationships with heterosexual partners to conceal their true sexual orientation (Kenya Human Rights Commission 2011).

Child Marriage

Child marriage refers to marriage before the age of 18. This is a violation of rights, deprives girls of their health and education, and contributes to poverty and inequality. Though this practice was made illegal in Kenya in 2014, it persists. Approximately 23 percent of Kenyan girls are married before reaching their 18th birthday. Instances of child marriage are highest in the North Eastern and Coast Regions and lowest in the Central Region and Nairobi. Girls in rural areas are twice as likely to be impacted by child marriage (UNICEF 2016). The practice is connected to the traditional beliefs of some groups, a lack of education, and poverty.

Bride-Price

When Kenyan women marry, it is common for a bride-price to be given, in which the groom’s family pays the bride’s family, the opposite of a dowry. The bride-price is approximately four times the groom’s household income and is often exchanged via cash payment or with livestock (Anderson 2007). Bride-price is most common in traditional societies, as it is connected to the strong role females play in agriculture, though it also serves to create alliances between kinship groups. The impact is that some women are regarded as property in their marriages, which

further perpetuates power imbalances, but it also creates an incentive for educating girls, as there is some correlation between their level of education and their bride-price.

Polygamy and Widow Inheritance

Customary law in Kenya is entrenched in patriarchal values and allows for polygamy and widow inheritance, both of which were legalized in 2014 (Kamau 2014). These practices are common across sub-Saharan Africa. Polygamy allows a husband to have multiple wives, with no limit. Living arrangements within polygamous unions vary. Eleven percent of married women and 6 percent of married men are in polygynous unions (KNBS 2015). The highest rates of these marriages are correlated with the following: living in rural areas, living in the North Eastern Region, being over the age of 40, having no education or incomplete primary education, and being in the lowest income groups. The prevalence has steadily declined since the 1970s (Doodoo and Klein 2007). Polygamy negatively affects women's empowerment (Fenske 2015).

Widow inheritance, also called cultural remarriage or levirate marriage, is a social practice within some ethnic groups in Kenya, namely, the Luo, Maragoli and Abagusii in western Kenya. Statistics on its prevalence are not readily available. When a husband dies, a relative of the husband, most likely a younger brother, "inherits" his wife. He assumes the role of providing for the family and the full legal control granted in Kenyan marriage. This includes assumed consent to sexual activity. Culturally, the intention is rooted in superstition and seeks to preserve bloodlines and kinship, along with caring for the widow. Widow inheritance, and the cleansing rituals that proceed it, increase women's chances of contracting HIV and violate her rights if she does not consent to it. This practice promotes male domination and female subordination, greatly disempowering women and violating their rights.

Divorce

Divorce is less common in Kenya than other countries in sub-Saharan Africa. Only 6 percent of adult women in Kenya are divorced (KNBS 2015). Women are legally able to divorce their husbands on grounds of adultery, abandonment, cruelty or violence, alcohol or drug addictions, sexually transmitted infection, or failing to economically provide for the family (Doodoo and Klein 2007). Divorce rates in Kenya are positively correlated with urbanization and female employment, while a younger age at first

Invisible to the Law

In Kenya, same-sex relations between men are explicitly prohibited by Sections 162 and 165 of the Kenya Penal Code and carry penalties ranging from 5 to 21 years of imprisonment. Laws are much less clear regarding same-sex sexual relations between women. According to the International Lesbian, Gay, Bisexual, Trans, and Intersex Association, sexual relations between women are legal (www.ilga.org). Lesbians are invisible to Kenyan law.

Despite the lack of explicit laws surrounding lesbians, the general Kenyan culture regularly describes all forms of same-sex desires as crimes against Christianity and Islam, the two largest faith populations in Kenya. According to the *CIA World Factbook*, 82.5 percent of Kenyans identify as Christian, and 11.1 percent identify as Muslim.

Many online resources based in Kenya are difficult to access due to bandwidth capacities, but the Gay and Lesbian Coalition of Kenya (GLACK) has a Web site with information about their work as well as other organizations, including Artists for Recognition and Acceptance (AFRA-Kenya), an organization of lesbian, bisexual, and transgender (LBT) women artists in Kenya. The GLACK Web site is www.glack.org.

—Whitney K. Archer

marriage and lower female education reduce the likelihood of divorce (Clark and Brauner-Otto 2015).

Children

Though rates of childbearing outside of marriage have increased in Kenya, marriage is still an event that dictates the onset of childbearing. The average age at first birth for Kenyan women is approximately 20 years old, and on average, Kenyan women will have 3.9 children. Both statistics are influenced by women's educational attainment and wealth. Voluntary childlessness is rare among married women in Kenya (KNBS 2015). Raising a family is a significant component of most women's lives. There are sociocultural values attached to this, along with practicalities, such as having children to help with household and agricultural duties and to care for parents when they age.

Women's Voices

Wangari Maathai

Wangari Maathai was an environmental activist from Kenya. In the mid-1970s, she “introduced the idea of planting trees with the people” (Nobelprize.org 2016). This inspiration led to the creation of the Green Belt Movement, a movement that seeks to empower women and help the environment by paying poor women to plant trees. In 2004, Maathai became the first African woman to win the Nobel Peace Prize. Speaking on the importance of environmental activism, Maathai said, “We cannot tire or give up. We owe it to the present and future generations of all species to rise up and walk!” (Green Belt 2016). When she died of cancer in 2011, her obituary in the *New York Times* described her as an “environmentalist, feminist, politician, professor, rabble-rouser, [and] human rights advocate.”

Household Structure

Patriarchal norms and male dominance still persist in Kenyan households. Women are head of the household in only 34 percent of homes, with slightly higher rates in rural areas (APHRC 2014). This means that women are likely to have less decision-making power over their finances, other family affairs, and personally. In only 39 percent of households are women primarily responsible for making decision about their own health, and in only 23 percent of households are women primarily responsible for making decisions to visit friends and family. Only half of married employed women make independent decisions on how to spend their earnings (KNBS 2015).

Women are still primarily responsible for domestic and reproductive work, including household chores, child and elder care, and agricultural work. This of course varies with socioeconomic status and women's employment. Upper- and middle-class families often have live-in domestic help, which alleviates some of the burden of domestic duties on Kenyan women. Women living in rural areas without access to tap water, often spend the majority of the day fetching water for their families. Women's responsibility for domestic work is entrenched from an early age; girls are required to help with household duties.

Household and family instability is an issue in Kenya and across sub-Saharan Africa. Change in family structure has been found to disadvantage children and to negatively impact their well-being. Factors contributing to family

instability in Kenya include migration, child fostering, widowhood, divorce, civil conflict, and the HIV/AIDS epidemic (Clark and Brauner-Otto 2015). Though recent changes to Kenya's Constitution permit women to own and inherit land and assets, this is still limited in practice. Of women who own property and assets, less than 10 percent have sole ownership, compared to more than 30 percent of men with sole ownership (KNBS 2015).

Politics

Since gaining independence in 1963, Kenya has operated under a democratic governance system. As of 2013, Kenya operates under a devolved, or decentralized, government that is divided into 47 different counties. Prior to this, the country operated under a centralized government with 8 provinces. Given this recent change in structure, the establishment of institutions and administration remains a work in progress and is faced with many challenges.

Since its inception, Kenya has been plagued by governance issues, ranging from petty corruption to state-sponsored violence, but it manages to remain relatively, though precariously, stable in comparison to some of its neighboring countries in sub-Saharan Africa. In the wake of the 2007 presidential election, the country fell into a state of ethnic conflict that resulted in a political, economic, and humanitarian crisis. The Rift Valley Region was the center of the conflict, which resulted in 1,000 deaths,

more than 500,000 persons internally displaced, and widespread destruction of property (Waki Commission 2008). The conflict ended when a power-sharing agreement was reached between the political parties. Under this Jubilee Agreement, Kenya became a multiparty democracy. This also laid the groundwork for a new constitution, implemented in 2010, along with electoral, police, and security reforms. The following presidential election in 2013 was rife with instability, but the country remained relatively peaceful, as the power-sharing alignment remains intact.

Corruption plagues Kenya's governance. Transparency International (2017) assesses corruption in Kenya to be high, ranking it only 145th of 176 countries. The World Bank's (2017) governance indicators report that the country's most prevalent governance issues relate to political stability, the absence of violence and terrorism, and control of corruption. Their regulatory quality, government effectiveness, and rule of law are less problematic in comparison. These issues impact women's inequality, poverty, security, and human rights.

Laws and Policies Impacting Women

The 2010 constitution reflects a commitment and step forward in addressing gender inequality and ending discrimination against women and other groups. Kenya's legal frameworks were considered to be one of the biggest obstacles to gender equality. The constitution now guarantees equality before the law and full and equal enjoyment of all rights and freedoms, including protection from direct and indirect discrimination on the basis of race, sex, pregnancy, marital status, health status, ethnic or social origin, color, age, disability, religion, conscience, belief, culture, dress, language, or birth. Protections surrounding pregnancy, marital status, and health status, among others, are expected to be of the most benefit to women. Affirmative action to account for historical gender inequality is also now mandated. This includes a requirement for a minimum of one-third representation of women in Kenya's parliament and public service.

The constitution now voids any law in Kenya that is in contradiction of it. It also stipulates that any international treaty or convention ratified by Kenya forms part of Kenyan law. A number of agreements that Kenya has signed will benefit women's equality, including the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) and the Convention on the Rights of the Child.

Kenya's Constitution now reigns supreme over customary law in areas where they overlap or conflict. This is a major step forward for women's rights, as many of the antiquated and discriminatory practices against women in Kenya were permissible under customary law, including rights in marriage, property ownership, and children.

One of the most significant improvements to the lives of Kenyan women that resulted from the new constitution is the right to own and acquire property individually or in association with others. Women are now legally entitled to have property registered in their names; to have full possession and control over property, including the management, sale, or inheritance of it; and to acquire loans by using property as collateral. In Kenya's agriculturally based and gender-segregated society, this is critical for securing women's livelihoods and ending discrimination.

Specific to marriage and children, women are now afforded equal rights at the time of, during, and at the dissolution of a marriage. Civil, religious, and customary law marriages are all still permitted. The constitution now declares that child care is the responsibility of both the mother and the father, whether or not they are married. Women's and children's citizenship is also now protected and no longer tied to marriage to a Kenyan man. Women's rights to matrimonial property, including land and their home, are now protected during and at the termination of a marriage. These new legal protections are a significant move forward for women's rights, as these issues and dynamics along with property ownership are central to their inferior status to men.

Changes made to Kenya's Constitution are progressive and provide a necessary platform for advancing women's rights and gender equality. However robust and progressive these new legal requirements are, mechanisms for implementing and realizing these changes are unclear. To date, the impact of this legislation on women's lives has been limited in effect. It is also relevant to note that the constitution still does not recognize protection for sexual orientation or gender identity, which are major barriers for the LGBTI community and women.

Kenya's National Gender and Equality Commission is the institution tasked with ensuring gender equality and freedom from discrimination as set out in the new constitution. They are also responsible for ensuring that Kenya's development policy, Vision 2030, is aligned with gender equality. It aims to ensure gender equality in the country by 2030 as part of achieving sustainable development and growth.

Organization Spotlight: Kakenya's Center for Excellence

Kakenya Ntaiya had a dream that all the girls in her village could go to school. Raised in the Maasai village of Enoosaen in Southern Kenya, Kakenya negotiated with village elders to be granted permission to continue her education and later to leave her village for college. She was the first girl to leave her village to pursue higher education. The entire village contributed to pay for her journey, and she promised she would return and use her education to benefit her community. After completing her doctorate degree from the University of Pittsburgh, Kakenya returned to Enoosaen to turn her dream into a reality.

Founded in 2009, Kakenya's Center for Excellence serves students in grades four through eight. Currently, the biggest challenge for young Maasai girls is to stay in school in the face of pressure to drop out for marriage. When parents enroll their daughters at the center, they promise they will not force their daughters to marry or to go through female genital cutting. The school currently welcomes 155 girls.

Women's Participation in Politics and Government

Kenyan women have a long history of political engagement in Kenya, from precolonial days to the present. They even had a female chief during colonial rule, Wangu wa Mak-eri, from 1901 to 1909. Women were granted suffrage (the right to vote) with the country's independence in 1963. Despite this, Kenya's patriarchal values and society and other factors that include governance and institutional issues have limited women's formal participation in government in terms of both access and presence. Under the gender equality requirement of Kenya's 2010 Constitution, a record number of 86 women were elected to the country's parliament in 2013. This landmark achievement for women in Kenya saw this number of women elected surpass the combined total number of women ever elected in the country's postcolonial history. Though this represents substantial progress, the current 19 percent of women

in parliament falls short of the 33 percent constitutional minimum (Association of Media 2015). Other notable successes include the election of a blind, disabled woman, Linet Kemunto Nyakeriga, to parliament and the appointment of Kenya's first female secretary of defense, Raychelle Omamo. The lack of women in politics is a challenge in Kenya's continued efforts to reshape male-dominated politics, policy, and resource allocation. In her 2014 analysis on women in politics, Maria Nzomo also highlights that simply because women sit on parliament in Kenya, this does not mean that gender equality is a priority. She further states that due to the patriarchal sociopolitical context in Kenya, feminist agendas are discouraged and often silenced (Nzomo 2014).

Conflict

Though Kenya is generally stable in comparison to its neighboring countries, conflict and violence remain as issues. Conflict and violence in Kenya are typically complex, historically rooted, vary regionally, and often occur in multiple and overlapping contexts. The drivers of conflict include corruption and political unrest, particularly surrounding elections; social fragmentation; discrimination; ethnic and religious identity conflict; state neglect; poverty; inequality and marginalization; rights to resources; land; spillover violence from neighboring Somalia; and persistent low-level violence, all of which is exacerbated by a lack of security in Kenya. Women are subjected to increased violence and sexual violence as a result of conflicts. Following the 2007 election crisis, rates of violence against women were more than three times higher than usual rates, and women and girls living in refugee camps as internally displaced persons experienced multiple levels and various forms of violence (Rohwerder 2015).

LGBTI

Kenya's social and political fabric is not accepting of lesbian, gay, bisexual, transgender, or intersex (LGBTI) peoples, which is reflected in the country's political and legal environment. Same-sex activity and relationships between men are illegal and punishable by up to 14 years in prison. No Kenyan legislation makes reference to same-sex relations between women, and it has not yet been subject to judicial interpretation. Despite the fact that is not explicitly prohibited in the criminal code, women in Kenya who pursue same-sex relations are still at risk for persecution socially, under customary law, and informally under statutory law.

Violations of LGBTI rights in Kenya are prevalent, systematic, and rarely addressed by the state when reported (KHRC 2011). LGBTI Kenyans are subject to routine abuse, hate speech, and violence from mobs and rape by police, vigilantes, and organized criminals. Other violations include harassment by government officials and police of persons presumed to be homosexual or lesbian, extortion for bribes, and demands for sexual favors in lieu of arrest or fines. Few of these crimes are reported to police.

Religious and Cultural Roles

Kenya has diverse citizenry, with over 40 distinct ethnic groups spread across the country. The five largest ethnic groups are the Kikuyu, Luo, Luhya, Kamba, and Kalenjin, which combined account for over two-thirds of the country's population (KNBS 2015). Ethnicity remains an important part of Kenyan society, culturally, personally, and politically. Beyond these indigenous groups, Arab and Asian Kenyans also call the country home. Religion is important in Kenya. Approximately 80 percent of Kenyans identify as Christian, predominantly Protestant and followed by Catholic; 10 percent identify as Muslim, and 2 percent belong to traditional religious groups (KNBS 2015).

Culture in Kenya is vibrant and lively, reflective of a wide range of traditional and modernized cultural practices, which vary given the country's diversity. Practices common across groups include various initiations, rituals, and rites of passage, which last from days to months and celebrate events such as transitioning from child to adult, marriage, and hunters having their first kill. Traditionally, female genital cutting (FGC, also referred to as female genital mutilation, or FGM) was the rite of passage from girl to woman, but groups are increasingly moving away from this illegal and dangerous practice toward alternative rites of passage.

Superstition is also common among Kenyans. These range from believing in protective powers from charms and ornaments called *juju* to believing that having sex with a virgin girl will cure HIV. Kenya's motto is *Harambee*, which is Swahili for "pulling together." Kenya's community self-help tradition is normally a responsibility that is placed on women and girls as community organizers.

Issues

Violence against Women

Violence against women (VAW) is a widespread issue in Kenya. This primarily occurs within the family or

household and within the community. Violence against women is rooted in historical and cultural patriarchal societal structures, colonization, and socioeconomic change. It is a violation of human rights and has adverse health impacts, physical and psychosocial at the individual and population level, along with intergenerational effects and broader socioeconomic impacts. VAW occurs in all demographic groups in Kenya and is shrouded by a culture of silence, as women are often socialized into tolerating and rationalizing acts that are perpetrated against them.

Forty-four percent of adult Kenyan women have experienced at least one act of physical violence against them, and 20 percent are currently experiencing frequent or occasional physical violence. Fourteen percent of adult Kenyan women have experienced sexual violence at least once, and 8 percent are currently or have experienced it in the past 12 months. The majority of violence against women in Kenya is committed by the woman's husband; only 4 percent of women report being subjected to violence by a nonpartner (KNBS 2015). Young Kenyan women are three times more likely to be subjected to violence than males (KNACC 2014). The Kenyan government has taken measures to address this problem, including implementing various forms of legislation and protective measures. Progress is hampered by patriarchal values and the silence surrounding the incidents, the majority of which are never reported to authorities.

Female Genital Mutilation

Female genital mutilation (FGM), also called female circumcision or cutting, is a traditional cultural practice within some ethnic and religious groups in Kenya. This involves cutting and mutilating girls' genitals as a rite of passage from girlhood to womanhood, in preparation for marriage, typically between the ages of 5 and 14. It is also performed as a means to control women and reduce her sexual pleasure and demands. FGM is a violation of women's and girls' human rights and can have serious medical complications, including severe pain, excessive bleeding, shock, infections, death, and psychological issues in the short and long term. The majority of FGM in Kenya is performed by traditional cutters outside of medical facilities, which increases the likelihood of these adverse health impacts.

As of 2011, FGM is illegal in Kenya, but it is still practiced. Twenty-one percent of adult Kenyan women have

been subjected to FGM. It is most prevalent among those in the Muslim religion, accounting for more than half of all females affected, and the Somali, Samburu, Kissii and Maasai ethnic groups. It is more common in rural areas and has the highest prevalence in the North Eastern Region (KNBS 2015). Whether a girl's mother has been circumcised and her level of education also impact the likelihood of the practice.

Civil Society and Activism

Kenya has a vibrant civil society and activism community. Kenya's *Harambee* tradition of community self-help has largely been driven by women, particularly in rural areas. Ngugi (2001) describes these self-help or microlevel development groups as the "life blood" of development in Kenya. With women as partners in the development process, they are given a political profile and voice, enabling them to develop. These groups are an effective social force and have made great contributions to development in Kenya, specifically to women's lives and beyond. GROOTS Kenya is a network of women's self-help groups that provides a platform to strengthen the grassroots role of women in development. Women's activism in Kenya has a long history of advocacy and action to address equal rights and equality and to improve social, economic, and legal conditions for women. The focus, tactics, and impact of these efforts vary widely. Women are well represented in leadership and senior positions within these organizations, substantially more so than in other sectors in Kenya. One of the most notable organizations in Kenya is the non-profit Green Belt Movement, which was founded in 1977 by Professor Wangari Maathai, who was later awarded the Nobel Peace Prize for her work in improving women's livelihoods, rights, and the environment.

Climate Change

The effects from climate change in Kenya and sub-Saharan Africa are increasing in magnitude and frequency. Climate change has contributed to an increase in extreme events and disasters, including drought, flooding, and landslides, and it stresses everyday life through loss of livelihoods, food insecurity, and health impacts. Given their dependency on the environment for their livelihoods and relative levels of poverty, women are more vulnerable to these effects. Due to their marginalization socially, economically, and politically, women often have less capacity to

cope and respond. Though their situation is dire, women are effective and important agents of change for both mitigating and adapting to climate change due to their innate knowledge, experience, and connection with the environment and their livelihoods.

Kingdom of Saudi Arabia

Overview of Country

The Kingdom of Saudi Arabia is located in Southwest Asia, in what is known as the Middle East, bordering the Persian Gulf, Red Sea, and northern Yemen. In total, Saudi Arabia covers almost 830,000 square miles (2,149,690 sq. km), none of which is water. Home to the world's largest sand mass, Rub' al-Khali (Empty Quarter), Saudi Arabia's terrain is largely dry desert, and its temperature reaches

great extremes. The capital of Saudi Arabia is Riyadh, and the country is known as the birthplace of Islam, with the cities of Mecca and Medina housing two of the holiest shrines.

In 2015, Saudi Arabia was ranked 56th out of 155 nations on the UN Development Programme's (UNDP) Gender Inequality Index (GII, 0.284). GI is calculated based on Saudi women's reproductive health, empowerment, and economic activity, including measures of maternal mortality, adolescent childbirth, educational attainment, workforce participation, and political involvement (UNDP 2015).

The Kingdom of Saudi Arabia and the Saud monarchy were founded through a series of tribal wars. In 1932, Muhammad Ibn Saud, King of Najd, formed a strategic alliance with leaders of the Wahhabi Islamic community to secure military victory over the warring territories. Saud emerged as the first king of Saudi Arabia, and religious cooperation became integral to the nation. The national power structure in Saudi Arabia remains with the Umara, the Saud family dynasty, and the Ulama, the community of trained religious preachers. As of 2015, King Salman bin Abd al-Aziz Al Saud succeeded his late half-brother, Abdullah bin Abd al-Aziz Al Saud, to the throne. The political structure remains an absolute monarchy, and legal structure is bound to sharia law, which finds its roots in Islam's Holy Koran.

The population of Saudi Arabia is 27,752,316; according to a 2015 United Nations estimate, immigrants comprise 30 percent of this population. The most dominant and official religion of the country is Islam, with close to 90 percent of individuals being Sunni Muslims. However, although Saudi Arabia is home to a substantial number of foreigners, public expression of religion that is not consistent with Islam is prohibited and non-Muslims may not obtain Saudi citizenship (CIA 2016).

Saudi Arabia is the world's largest exporter of oil, and it plays a leading role in the Organization of the Petroleum Exporting Countries (OPEC). However, with an economy that depends so wholly on a single source of revenue, the country has been facing serious economic deficits—approximately USD\$87 billion as of 2016. As such, major contemporary challenges for Saudi Arabia are economic diversification, privatization, national spending cuts, and inclusion of more nationals, including women, in the workforce (Hill et al. 2015, 20).

Of note politically, the country was struck by major terrorist attacks in May and November 2003 as well as

smaller attacks in July 2016. These attacks sparked an ongoing commitment to combat domestic terrorism and extremism, with Saudi Arabia leading a 34-nation counterterrorism Islamic coalition (CIA 2016).

Regarding the contemporary circumstances of women, Saudi Arabia maintains strict laws enforcing gender segregation in public spaces; women must always wear an abaya (a full-length black cover) and are not permitted to drive. This restricts many women from participating in the workplace, as they have limited autonomy and must rely on the support of men to not only commute to work but also create a sex-segregated work environment. The same applies for education, as Saudi national schools are also sex-segregated and differ in the curricula taught to males versus females to preserve a traditional Saudi society; this serves to direct women toward a domestic or “more feminine” vocational path.

However, maintaining the framework of sex-segregation and overall Saudi tradition, 2005–2015 saw notable changes in the lives of women in Saudi Arabia. Such advancements were greatly to the credit of the late King Abdullah's vision for modernization, balancing the need for progress and national identity. Among a range of projects directed at socioeconomic advancement, he expanded employment and political opportunities for women. The country held its first elections in 2005 and 2011, where citizens voted for municipal council members. Moreover, in 2015—for the first time—Saudi women were allowed to vote and stand as candidates for the municipal elections. Twenty-one women won seats (CIA 2016).

Girls and Teens

Impact of Sex-Segregation on Daily Life

Sex-segregation is a major influence on the lives of young girls and teens in Saudi Arabia. By age seven, boys and girls are separated in public spaces, including schools, restaurants, and malls. Females and males are only permitted to be together in the company of direct relatives, and public spaces are separated into sections of “family and women” and “single men.” In terms of education, classrooms in schools and universities are gender specific, and girls' facilities have historically been of poorer quality. Although the government has been developing the quality of education available to girls, their access to libraries and other public education facilities is also compromised due to sex-segregation. Girls in schools (and, later, women in universities) are limited in the subjects they may pursue,

focusing on “feminine” disciplines that lead to careers where sex-segregation is enforceable. This affects a young girl’s ability to pursue the career of her choice and can also hinder her ability to rise to leadership positions alongside male counterparts in the future.

Health Care and Related Issues

Among young women aged 15–19, there are 10.2 births for every 1,000 women, which is relatively low compared to other countries (UNDP 2015). Within Saudi Arabia’s cultural framework, sexual activity is only acceptable within a marriage; this makes studies on sexual activity, contraceptives, sexually transmitted infections, and sexual violence challenging to research among the population.

Major health risks for girls and teens in Saudi Arabia include dietary issues, leading to almost 30 percent of female children being obese; vitamin D deficiency in close to 96 percent of female children; sedentary behaviors; and dangerous behaviors, such as substance and tobacco use, bullying, and violence. Female adolescents (21.4%) reported dangerous behaviors, such as substance abuse of solvents, at almost double the rate of male adolescents (11.5%). Additionally, female youth also presented with mental health issues, particularly depression and anxiety, more than male youth (Albuhairan et al. 2015, 263–266). Several studies have suggested a greater need for health care institutionalized within school systems as an effective approach to addressing the needs of adolescent females in Saudi Arabia.

Recreation

As mentioned, obesity and being overweight is an epidemic among children and adolescents, especially young girls. This health issue is largely due to sedentary lifestyles, poor dietary habits, and lack of education on health and nutrition. Most girls and teens spend their leisure time watching television or engaging on personal electronic devices, as opposed to being active. In fact, female adolescents (59.3%) report much higher instances of complete lack of exercise than males (31.7%) (Albuhairan et al. 2015, 265). In addition to lifestyle issues, the prevalence of early female obesity and being overweight is also a result of cultural obstacles. For instance, Saudi Arabia’s Ministry of Education only requires one physical activity session in boys’ schools, while requiring none for girls’ schools. Furthermore, due to sex-segregation in public spaces, girls are restricted in the recreational spaces they can access, and

there are far fewer public recreational spaces provided specifically for females.

Education

Primary–University Level

The level of female education in Saudi Arabia is rising as one of the nation’s development efforts. Recent estimates show that 60.5 percent of women, compared to 70.3 percent of men, have attained secondary-level education (UNDP 2015). Additionally, literacy rates (being those over 15 years of age who can read and write) are relatively high at 94.7 percent overall, with 91.1 percent of females and 97 percent of males being literate (CIA 2016). Interestingly, in tertiary education, female enrollment rates in Saudi Arabia now exceed those of men (Obermeyer et al. 2015, 7). However, in considering postsecondary education, it is also important to note that male Saudis have easier access to higher education abroad based on fewer cultural restrictions.

The first school for females was opened in 1960. It was governed by the General Presidency of Girls’ Education founded in 1959, which was later amalgamated into nationwide Ministry of Education. Since then, Saudi Arabia has seen a continual growth in colleges and universities for women, with the first college accepting women in 1970 and the first university campus solely for women, Riyadh’s King Saud University, established in 1979. In fact, recent statistics show that women make up almost half of Saudi Arabia’s undergraduate enrollment (Hamdan 2005, 51, 53).

While there is greater emphasis and facilitation of female education, such progress is framed within traditional boundaries that include sex-segregation. Schools and universities are sex-segregated in students and faculty. Gender-specific educational policies emphasize domestic or traditionally more “feminine” roles for women within curricula. Additionally, choice of curricula and subjects are restricted at various educational stages for women (El-Sanabary 1994, 141). Although women in Saudi Arabia are advancing in educational attainment, traditional social order is preserved through these academic institutions.

Access to Education

Saudi Arabia’s government greatly facilitates females’ access to education, providing free education for all

individuals through public schools. This benefit has contributed to a considerably narrow education gap between men and women in Saudi Arabia. In addition to tuition, both Saudi Arabian females and males enjoy free supporting expenses, including textbooks, supplies, uniforms, transportation, and boarding, as needed. This universal access to education can be seen as a national effort to provide females with some extent of social and economic mobility.

However, although females are entitled to free education, a gap in achievement arises when considering discrepancies in the quality of education afforded to women compared to their male counterparts. For example, approximately 34 percent of educators in male schools hold a doctoral degree, compared to only 3 percent of educators in female schools. Females are also restricted from accessing the almost 200 libraries operated by academic and religious institutions as well as the 70 public libraries, unless they are accompanied by a male guardian (Hamdan 2005, 53). These hurdles, mostly resulting from social and cultural restrictions around a woman's role in public, compromise females' quality of access to education.

Women in Saudi Arabia also face further challenges when choosing educational disciplines. Common educational fields considered appropriate for women include teaching, nursing, social work, and medicine. In particular, medicine is seen as one of the most prestigious occupations for Saudi females, who comprise more than 40 percent of the students enrolled in medical studies in the country. Women in Saudi Arabia also regularly pursue natural sciences (56% of enrollment), mathematics (46%), and computer science (46%), frequently applying their education to teaching positions (El-Sanabary 1994, 147–149).

Social Impact of Education Policies

In 2003, Saudi Arabia's Ministry of Planning and Human Resources reported that the number of women unmarried at age 30, which is typically uncommon for a Saudi woman, has increased to almost a third of the country's population. Woman's increasing pursuit of education was cited as the driving reason. This increase is indicative of a growing trend of Saudi women striving for education, careers, and more independent social and economic mobility. As the country develops high-quality female educational facilities, it is likely that women's academic attainment will continue to increase and will need to be matched by commensurate workforce opportunities.

Health

Access to Health Care

The Saudi Arabian government provides universal health coverage, ensuring that the entire population has free and widely accessible health care. Hospitals are well-equipped with medical technology and trained personnel; medical professions are considered very prestigious and are also open to females. However, the *Saudi Health Interview Survey* found that despite free universal health coverage and a widespread increase in chronic diseases and tobacco use, three-quarters of Saudis report never having a routine medical checkup (Mokdad 2016).

The issue of Saudi populations not regularly accessing health care also persists among adolescents; one in four Saudi adolescents report not being able to access health care as extensively as they would prefer. They also felt physicians did not spend enough time addressing their concerns during visits, leading to a general lack of focus on adolescent health needs (Albuhairan et al. 2015, 268). This lack of health care access despite free universal coverage suggests that perhaps Saudi Arabia needs to instill a greater cultural focus on medical care, especially among young populations. Various analyses have suggested incorporating health care as a greater institutional measure within schools and educational centers for both females and males.

Maternal Health

Maternal health in Saudi Arabia is relatively good by global standards. The country maintains low maternal mortality rates and has taken significant steps to fulfill the UN Millennium Development Goals related to safeguarding maternal and child health. Estimates from 2015 show that 12 women die from pregnancy-related complications for every 100,000 live births in Saudi Arabia (WHO 2015). Additionally, with a fertility rate of 2.12 children per woman, there are 18.51 births per 1,000 population (CIA 2016).

Saudi Arabia's health policy holds reproductive health as a fundamental focus. The country has an established comprehensive maternal care program, which provides the full continuum of health care to mothers, covering prenatal through postnatal needs. This extensive focus on maternal health has proven effective: the number of pregnant women who received care from health professionals increased from 90 percent in 2000 to 98 percent in 2010. In

the same period, the proportion of births assisted by health professionals increased from 88 percent to 97 percent. Additionally, 93 percent of mothers in 2000 compared to 96.1 percent in 2010 were vaccinated against neonatal tetanus. The United Nations has applauded Saudi Arabia on fulfilling the maternal health related Millennium Development Goal in 2015; the country continues to enhance its health care programs, high-quality services, and medical awareness for mothers before, during, and after pregnancy (UNDP 2010).

Diseases and Disorders

Overweight and Obesity

Globally, Saudi Arabia has one of the highest levels of individuals being overweight or obese, with over a third of female adults and children being overweight or obese (Denicola et al. 2015, 192). More specifically, 33.5 percent of females compared to 24.1 percent of males in Saudi Arabia are obese, and the prevalence increases as individuals age. Obesity is also tied to the prevalence of other health issues impacting Saudi female adults, including diabetes, high blood pressure, cholesterol, arthritis, cardiovascular disease, and effects of smoking (Mokdad 2016). In fact, according to the World Health Organization (WHO) almost half of Saudi females and males die from cardiovascular disease each year (Denicola et al. 2015, 197).

A main cause of widespread obesity among adult women in Saudi Arabia is the low level of physical exercise, measuring at one of the lowest worldwide. Due to increased industrialization, more than 70 percent of the population lives in major urban areas, and lifestyles are largely sedentary (Denicola et al. 2015, 192–194). Specific to Saudi females, half are physically inactive, while a third have very low levels of activity (Mokdad 2016). The central reason cited for lack of physical exercise is limited public spaces for women's recreation, which is required in a sex-segregated society. As such, the country needs more community health centers for women, integrated physical education classes in women's schools, and more public facilities dedicated for women's sports, exercise, and recreation.

Furthermore, considering that women spend most of their time indoors and are fully covered in the abaya when outdoors, many also suffer from vitamin D deficiency. This deficiency can cause depression, eating disorders, and eventual weight gain. As mental health is an underaddressed health issue in Saudi Arabia, the cycle of weight gain resulting from depression and eating disorders also

contributes to females being disproportionately overweight or obese.

Additionally, there is a lack of overall nutritional awareness and poor dietary habits. Because of industrialization, the Saudi population overall consumes substantial amounts of ultra-processed food products and fast foods. For example, in female adolescents, being obese is significantly tied to greater consumption of sugary drinks and savory snacks. In addition, social gatherings in Saudi society are common, and, culturally, eating in large quantities is encouraged. As traditional food consists of large quantities of oil and animal fats, this social custom also contributes to poor dietary habits.

Breast Cancer

Breast cancer is the most common cancer among Saudi females; however, awareness of how breast cancer presents is low. Although 47.1 percent of Saudi females knew what breast cancer was, only 15.4 percent had substantial knowledge of its presentation and risks. Additionally, of the women who attended a general clinic, only 12 percent had practiced a breast self-exam. The lack of awareness about breast cancer is also exacerbated by most of the population not accessing regular health checkups, as discussed previously (Milaat 2000, 340–342).

Employment

Cultural Barriers for Women in the Workforce

In Saudi Arabia, 20.2 percent of women participate in the labor market, compared to 78.3 percent of men (UNDP 2015). The main reason for this disparity is sex-segregation, which has historically prohibited women from working in environments where they would be in company of men who are not their immediate relatives. Even though sex-segregation is a norm in Saudi Arabia, and men and women alike have supported this arrangement, it means that there are fewer jobs and career paths that can accommodate women alongside men. Additionally, the country relies heavily on an international workforce that comprises approximately a half of those employed (CIA 2016). Researchers have suggested that the heavy reliance on foreigners also detracts from female employment opportunities, hindering women's potential to drive economic growth. However, there have been gradual improvements in accommodating Saudi women in the workforce, indicating potential for females' steady professional development.

National Policies Regarding Women in the Workforce

To employ women, the Ministry of Labor requires companies to maintain certain standards and policies upholding sex-segregation. Faced with the additional costs and risks associated with integrating women in the workplace, many employers simply choose not to, disadvantaging females' employment opportunities. Aside from the challenges of sex-segregation, women in Saudi Arabia also face additional policy, or lack thereof, hurdles to employment. For example, although "Saudiazation," the nationalization policy of employing more Saudi citizens in the private sector, has made women more visible in the workplace, employers do not yet see them as a priority. Furthermore, policy makers have done little to facilitate and protect women in the workplace in terms of harassment, which provides little incentive for women to join the workforce.

However, in recent years, the number of "mixed" spaces that enable women to be employed has increased steadily. These fields of employment include hospitals, head offices of banks, and other private firms. Interestingly, for women who do work in these spaces, there are progressive policies that support her maternal and familial responsibilities. Women in Saudi Arabia are entitled to 10 weeks of maternity leave, in some cases with full pay. Women are also given daily time off from work to nurse or breastfeed their infants once they do return to work. Employers must pay for medical coverage, and they are prohibited from terminating a woman's employment based on illness or pregnancy-related leave.

Recent Rising Female Employment

The 1990s marked high rates of joblessness, especially for youth in Saudi Arabia's then-saturated public sector. Since then, the country has focused on developing its private sector, which better enables female workforce participation. Today, private-sector growth is a central emphasis in Saudi Arabia, as the government works to diversify its highly oil-dependent economy. For women, this entails more jobs. In particular, in 2004–2005, the Saudi government officially recommended that organizations establish 'female sections' to integrate female employees while maintaining sex-segregation and urged the hiring of Saudi women in the private sector.

Of note, banks have always been an accommodating space for Saudi women to work, with Al Rajhi Bank opening the first female branch in 1980. Currently, with continued private-sector growth, banks remain an increasingly

popular employment option for women. Many banks have integrated female employees by opening female sections within their public workspaces and hiring women across their ranks.

It is interesting to note that although there still exists significant disparity in Saudi female employment compared to that of males, women in Saudi Arabia still own close to 40 percent of the nation's private wealth (Hamdan 2005, 47).

Female Leadership

Even though policies and workforce arrangements are gradually accommodating more Saudi women in the formal employment sector, leadership roles and decision making continue to be dominated by men. Estimates from 2015 show that 0.1 percent of corporate board members in Saudi Arabia are female, ranking the nation as one of the lowest in the world for females in executive leadership positions (Hill et al. 2015, 26). Strikingly low levels of female leadership can be attributed to the notion that Saudi women are less educated or less experienced than their male counterparts. As women are increasingly striving for higher education and professional opportunities, it is possible that they will eventually overcome this lag in qualifications.

However, despite higher education and professional attainment, many social science researchers still maintain that it is unlikely that Saudi Arabia will see equality in levels of female leadership in the workforce. This is in large part due to deep-rooted cultural restrictions and traditional boundaries that hinder the extent of women's public participation and empowerment in a male-dominated society.

Family Life Female Identity

Core to national identity are values surrounding female identity that are maintained through sex-segregation and an insistence on female piety. As such, the woman's first and foremost commitment is to her family, where she abides by traditional gender roles of a daughter, wife, and mother. These social obligations of female identity are also manifested legally. On her *iqama* (identity card), a woman's identity first appears associated with that of her father, and once she is married, her *iqama* associates her identity with her husband. A woman cannot hold an independent

identity card; her iqama must be associated with her father or husband, illustrating expectations of females' social, economic, and political dependence on men. Additionally, although children of Saudi mothers are not immediately entitled to Saudi citizenship, recent legal exceptions do in some cases allow Saudi mothers to pass citizenship to their children.

Marriage and Family

Marriage has historically been an expected trajectory of Saudi women's lives. However, Saudi women today are taking more control of their decision to get married, with many holding off to pursue independent goals of education and employment. In fact, as of 2010, the average age for a woman to get married in Saudi Arabia almost paralleled that of women in the United States, the former being 25 years of age and the latter 26. Women are also emphasizing their careers alongside family duties, with close to 75 percent of Saudi women believing that both men and women should contribute to earning household income. Although there are still ways to improve overall cultural attitudes regarding gender roles in the family, contemporary times have seen progress. Over half (about 55%) of Saudi men believe both husband and wife should work, which perhaps indicates some change in expectations of wives and mothers as being mutually exclusive from wage earners (Jawhar 2012).

According to law, a Saudi woman has the right not to be married against her will, hold a job, be educated, inherit wealth, and receive a living allowance in the case of separation from her husband. However, there are still challenges with fully safeguarding these rights for women. For instance, even though women may not be forced to marry, there is no law determining the legal age for girls to wed. Additionally, there is no law preventing male guardians (father or brother) from discontinuing a girl's education. Further, as mentioned, even though women may have the right to be employed, labor laws requiring sex-segregation in the workforce often dissuade employers from hiring women.

Politics

Social and Historical Context

The year 1979 marked a steady American presence in Saudi Arabia, with American workers moving to Saudi Arabia to work in oil production. With the influx of Western

residents, American women would be seen in public, unveiled, and often driving cars (which women in Saudi are not allowed to do). Many refer to this time as a rise in the Saudi women's movement to demand more political powers and liberties, equated to a lifestyle of their foreign counterparts living in the kingdom. In a country with a high international labor population, tensions of preserving traditional religious norms alongside accommodating modernization and globalization continue to persist at the nation's core. Saudi women's efforts to advocate for their rights have since taken various approaches, and their political participation appears to be increasing gradually.

Currently, women in Saudi Arabia hold 19.9 percent of the seats in parliament. This comes after significant efforts to boost female political participation, in which the government instituted mandatory quotas for female involvement in parliament (Obermeyer et al. 2015, 7). However, there are still certain obstacles when it comes to legislation surrounding women's rights. Namely, Saudi Arabia's judiciary operates under sharia law and basic law enacted in 1992. Basic law provides powers and duties of the state and lists individuals' rights, but it does not address women's rights specifically, which makes clarifying legal codes pertaining to gender challenging. Furthermore, protecting individual rights requires officials to refer to sharia law, which is left to the interpretation of the male-dominated Senior Ulama.

Gradual Progress for Women in Politics

Although there are hurdles, female political participation in Saudi Arabia has been gradually rising. The government is a strong proponent of this endeavor and has taken various steps to involve more women in politics.

Mandatory Female Participation in Parliament

In 2013, King Abdullah issued a historic decree that would allow women, for the first time, to be members of the kingdom's previously all-male Shura Council. The Shura Council consists of 150 members appointed by the king, and it serves as the nation's formal advisory board. The assembly can draft laws and propose them to the king, who in turn decides on the passing of the law. Per the 2013 historical amendments, there would now be a 20 percent female quota in the Shura Council; accordingly, King Abdullah appointed 30 women to join the assembly, marking a major step forward in Saudi women's political power (CIA 2016).

Saudi Arabia Reform Movement

Saudi Arabia's Reform Movement began in 1990, with a group of men and women across the nation seeking modernization that would help Saudi Arabia develop alongside changing social tides. In 2003, the movement presented its "In Defense of the Nation" petition to then King Fahad, Crown Prince Abdullah, and the Minister of Defense Prince Sultan. In total, 306 Saudi men and women signed the petition, representing areas from all over the nation, both Sunnis and Shia, and coming mostly from the elite socioeconomic class. According to the petition and reforms suggested, the Reform Movement accepts Saudi's monarchy but insists that the country needs to incorporate political and legal policies, both domestically and internationally, that better reflect developments in globalization. The Reform Movement is an important establishment for progress, gender equality, and women's political participation. It allows women a notable voice and space to work with their male counterparts to push progressive social and political agendas.

The 2003 "In Defense of the Nation" also led to countermovements from Saudi's radical Wahhabi groups. These groups claimed Saudi Arabia was losing its Islamic values by giving into pressures of development that were characterized as "Western." As resistance, there were demonstrations as well as several major terrorist suicide bombings in residential compounds, which mainly house foreigners. After the bombings, the Saudi government came down severely on extremism and terrorism, and by 2005, the threat of such attacks had diminished significantly.

His Highness King Abdullah's Commitment to Political Progress

King Abdullah came to power in 2005, and he made several notable social and political reforms. He curbed extravagant privileges for the royal family; enhanced access to education for women and men; involved Saudi Arabia more deeply in foreign affairs, for instance, by urging their application to the World Trade Organization; and encouraged a system of elections for the nation's municipal councilmen. In 2009, his efforts to develop Saudi Arabia led to the dismissal of the country's most senior judge and the head of the religious police, or the *muttawa*, both of whom were radical Islamists and had publicly approved extremist behavior.

King Abdullah was instrumental in leading progress in women's political empowerment. In 2009, he appointed the first woman to be a government minister; per cultural norms, she maintained the traditional sex-segregation in

her professional role, announcing that she would not be visiting male counterparts in their offices. King Abdullah also spearheaded the 2013 historical decree that established quotas for female political participation in the Shura Council. Although King Abdullah was a leader of social change—including building half a million low-income housing units, establishing minimum wage, increasing grants for university students, and working relentlessly to alleviate unemployment—he maintained his commitment to Saudi Arabia's political structure and traditional foundation. Most notably, this was seen when Saudi Arabia heavily suppressed the 2011 Arab Spring uprising within its borders and sent military reinforcements for neighbor Bahrain to do the same.

Religious and Cultural Roles

Saudi Arabia's Islamic orientation is derived from the Wahhabi subset of Sunni Islam. Sunni Islam in itself is known as the more orthodox and traditional Islamic discourse, and Wahhabism is a more radical branch within Sunni Islam. Considering the status of women, Wahhabi Islam places stringent restrictions on a woman's ability to be involved in the public sphere; it maintains that the woman's role is to be solely domestic. This is reflected in Saudi Arabia's culture, legislation, and national policies, which have largely emphasized women's traditional domestic roles.

As discussed, sex-segregation is a main part of Saudi religious and cultural life and is derived largely from traditional values and expectations of female piety. Determining the religious and cultural roles of women, sex-segregation is aimed at protecting the organization of a family, ensuring that one only interacts with individuals of the opposite sex to whom he or she is related. As such, Saudi culture has become organized into what seems like an autonomous space—a sphere of public life that is "female only." However, contrary to many assumptions, sex-segregation is also strongly supported by Saudi females. Women in Saudi Arabia have reappropriated sex-segregation to bolster their socioeconomic empowerment. For instance, women seeking women-only workspaces has allowed Saudi females to engage in the workforce more autonomously, partaking in leadership roles where they are not dependent on a male hierarchy for key decision making. This is particularly true in the female-only university system. Throughout spheres of education, employment, and politics, women continue working more or less within a traditional cultural framework to achieve greater empowerment and visibility.

A Baka woman pounds flour in a mortar in the jungle of the Central African Republic, November 2008. In rural Africa, food preparation is primarily the responsibility of women. Girls are taught to care for a home and depend on a male family member for economic security. As a result, fewer than 23 percent of girls complete the mandatory six years of schooling. Another part of women's religious and cultural lives in Saudi Arabia is the policing of their gender roles. The country has an official religious police, *muttawa*, that enforces rules regarding sex-segregation, female modesty, and other social and cultural norms. Many see the *muttawa* as exerting rigid control over women in the public sphere, disciplining them per conservative standards of Islam, and reaffirming the monarchy's commitment to religious values. In Saudi Arabia's history, there has been ebb and flow in how much control the *muttawa* was able to exert over women in the public sphere. However, more recently, the country has somewhat curbed the influence of religious police in the public sphere. This is consistent with national movements to increase women's public participation.

Issues

Recent Milestones

In Saudi Arabia, women have typically advocated for gender equality and justice within the framework of Islam, the dominant and official national religion. A recent milestone includes the 2013 passage of legislation against domestic abuse. In May 2013, the King Khalid Foundation in Saudi Arabia ran a strong public campaign demanding this legislation against domestic abuse, and for the first time, the

kingdom passed the law, in September 2013. Additionally, on October 26, 2013, more than 60 Saudi women publicly protested for their right to drive. They got behind the wheels of their cars and took to the streets to challenge a historical law that bans them from driving (Segran 2013). Although this protest did not succeed in overturning the ban on women driving, it was a highly visible demonstration and brought global attention to the issue. Discussed in greater detail below, a woman's right to drive is a highly contested issue in Saudi Arabia; although the country has never permitted women to drive, critics argue the ban has no foundation in the Koran but is rather based on biased interpretations of the extent of female autonomy.

A Woman's Right to Drive

The first women's driving demonstration in Saudi Arabia took place on November 6, 1990. Participants included 49 women from well-known families, many of whom were highly educated and employed in prestigious careers (Doumato 1992, 31). At the time, women were customarily not allowed to drive, as driving would bring them into the public spaces and not maintain their place in the private, domestic sphere. Although this restriction was enforced customarily, it was not bound to law at the time.

LGBTQ+, Same-Sex/Same-Gender Attraction

Arabic has no generally accepted equivalent for the word *gay*. *Al-mithliyya al-jinsiyya* means sexual sameness, and the term *mithli* is also used for people who identify as gay or "homosexual." Popular media, however, continues to use the loaded word *shad*, which translates as queer, pervert, or deviant. In many cases in Saudi Arabia and other places around the Arab world, engaging in same-sex activities is understood more in terms of sexual practices rather than a sexual identity.

There is no codified penal law in Saudi Arabia. Instead, the country applies strict Islamic law under which same-sex relations are illegal. Under the country's interpretation of Islamic law, all sex outside of marriage is illegal, and only heterosexual marriage is legal.

The Saudi law known as the kingdom's basic law states, "The home is a sacrosanct and shall not be entered without the permission of the owner or research to set in cases specified by statute." This clause is significant because it reflects an attitude toward domestic privacy. The clear separation of the public and private spheres aids authorities' ability to enforce strict behavioral codes in public, while within protected private spaces, different rules apply. Such privacy allows for same-sex activities to exist behind closed doors.

Because of the stigma attached to same-sex desire and the fact that it mostly occurs under the radar, it is difficult to get information about same-sex relationships and activism in Saudi Arabia. One exception is Brian Whitaker's book *Unspeakable Love: Gay and Lesbian Life in the Middle East*.

—Melissa Jacobs

Whitaker, B. 2011. *Unspeakable Love: Gay and Lesbian Life in the Middle East*. London, England: Saqi Books.

Saudi Arabia's religious police stopped the 1990 women's driving demonstration. The intervention was strongly supported by Interior Minister Prince Naif, who then made the previously unofficial ban on women's driving official. He established a fatwa that prevented women from operating motor vehicles. In addition, outraged by the women's civil disobedience, the Interior Ministry also banned women's involvement in political activity; however, this restriction has since been lifted. The women who were involved in the demonstration were punished publicly, slandered by media outlets, had their passports confiscated, and were suspended from their jobs. Some husbands also bore the consequences of this punishment, as they were seen as complicit in their wives' so-called vice.

The 1990 demonstration was a crucial point in Saudi history, as it marked a division between those who wanted more liberal, modern Islam versus those who wanted Saudi Arabia to retain literal and very conservative Wahhabi Islamic values. Considering the Interior Ministry's subsequent bans on women's autonomy and public participation, the 1990 demonstration sparked an immediate reaction of conservatism regarding gender roles, reinforcing values that consider a woman's role to be confined to the private sphere.

However, the issue of a woman's ability to drive is far from resolved, and women have continued advocating and protesting for the ban to be lifted. Before the 2013 women's driving demonstration, a group of prominent male and female activists presented a letter to Saudi Arabia's Shura Council, asking them to formally revisit the idea of women driving. The letter was rejected, sparking revived demonstrations. Women in Saudi Arabia continue pressing on this issue and asserting the absurdity of the driving ban. Many state simple reasons, such as not wanting to rely on male relatives for simple transportation, commute, and daily chores. Others also clarify that it is not possible for every family to afford a driver, or even want to hire one. Saudi Arabia's government is yet to reconsider legislation on this issue, but activists remain steadfast in their efforts toward change.

Human Trafficking

Human trafficking, mainly forced labor exploitation, is a major issue in Saudi Arabia. This injustice disproportionately affects low-skilled migrant workers who travel to the country to perform menial jobs. Typically, men and women from South and East Asia, the Middle East, and Africa come

to Saudi Arabia as domestic servants or low-skilled laborers; however, once employed, many report facing abuses pertaining to involuntary servitude, including nonpayment and withholding of passports. Reports have documented the stories of migrant workers who are forced to work indefinitely, even beyond the end of their contracts, because employers will not grant them a required exit visa to leave and have usually withheld their passports (CIA 2016).

Female domestic workers are particularly vulnerable, as they are isolated and confined in private homes. These women mainly come from Asian and African countries, and they have reported facing sexual abuse and being forced into prostitution in Saudi Arabia. Many attempt running away, but because of strict entry and exit laws as well as iqamas issued under their employers' names, they are often found and reexploited.

The Saudi government has taken steps to combat forced labor and human rights issues, publicly acknowledging this as a national problem. In the past two years, the Saudi government prosecuted and convicted a substantially larger number of trafficking offenders. Additionally, in 2014, more victims were identified and referred to protective services than in previous years. However, the government still has a way to go in thoroughly and appropriately addressing Saudi Arabia's human trafficking issue. For instance, the country still needs to investigate and prosecute employers for associated labor trafficking crimes, such as withholding wages and passports. Furthermore, there needs to be better protection for victims of human trafficking. Many victims who have been identified were not provided shelter. Additionally, those who were victims of illegal sexual exploitation (largely females) remained vulnerable to punishment for prostitution, adultery, sexual lewdness, and related charges, even though they were forcefully trafficked.

Lebanon

Overview of Country

Lebanon is a small country in the Middle East on the Mediterranean Sea. It is bordered to the north and east by Syria and to the south by Israel. Lebanon has a total area of 4,015 square miles (10,400 sq. km) and has a coastline of about 140 miles (225 km) in length. The mountains in Lebanon cover more than half of the country.

As of July 2016, the population of Lebanon was 6,237,738 (CIA 2017). The UN Development Programme (UNDP) ranks Lebanon 67th out of 187 nations on the Gender Inequality Index (GII, 0.385) (UNDP 2016).

The land was previously part of the northern Ottoman Empire province of Syria until France took over after World War I. In 1920, France claimed Lebanon as a region. Lebanon was granted its independence in 1943. Although there were some political bumps in the road, Lebanon was economically successful until the civil war that raged from 1975 to 1991. During the 15 years of civil war, there were an estimated 120,000 fatalities (CIA 2017).

Refugees in Lebanon

For years, Lebanon has accommodated refugees from other countries; today, approximately 450,000 live in Lebanon's refugee camps. Lebanon took in 100,000 Palestinians

during the 1948 Arab-Israeli War. Syrian and Palestinian refugees are allowed residency for six months if they pay for a USD\$200 permit; however, they are excluded from work. Refugees earn less than the Lebanese minimum. Syrian refugees live in poverty and have little access to employment and education.

Girls and Teens

Young girls' lives in Lebanon are heavily influenced by their religion, schooling, location, and family traditions. Religion and tradition are a big part of children's upbringing, helping to shape their identities, and because several different types of religions are practiced in Lebanon, these experiences for young girls can vary. Education is another influence in the lives of young girls. Approximately two-thirds of Lebanese children attend a private school, which is usually religion based (USAID 2016). It is not uncommon for a girl to go to a private school that is based on a religion that is different from the one her family practices. For many homes in Lebanon, the parental control of a daughter does not end when the child becomes an adult, but only when she is given to her husband.

Refugee Girls and Teens

Many young girls have fled to Lebanon with their families as refugees. Women and girls comprise approximately 79

percent of Syrian refugees in Lebanon (Global Fund for Women 2015). Young female refugees are currently living in overcrowded refugee camps or on the streets. This put them in a vulnerable position for all kinds of gender-based violence, including sexual violence and trafficking. Those who live in the camps struggle for such necessities as water and electricity. Keeping up with traditions is difficult for refugees, but mothers often hold the families together.

Extracurricular

At some of the private schools, clubs and activities are offered to the students, but not all families feel comfortable allowing their children to participate. For students that do participate, most have high parental involvement. For girls, female sports programs to promote empowerment have become more available since 2011 (Petersen 2011).

Sex Education

As of 2015, there is no sex education for schools in Lebanon. Talking about sex is socially taboo, but organizations are working to convince officials that a sex education program is valuable and needed.

Education

Since the government began to focus on literacy in Lebanon, girls have been excelling in schools. Girls earn good grades in school and have shown to be less likely to drop out than their male counterparts. From 2008 to 2012, nearly 90 percent of girls are enrolled in primary school and 80 percent in secondary school (UNICEF 2015).

There are slight gaps in academic progress between private and public schooling. Public schools have been suffering from the poor quality of materials and building conditions since the civil war. Private schools in Lebanon have a preschool phase and accept students as young as three years old; public schools start accepting students at the age of five years old. Approximately two-thirds of Lebanese student attend school at a costly private college (USAID 2016).

Lebanon is committed to improving the education and learning process for girls and women. In 1998, Lebanon passed the Compulsory Education Act that made compulsory education free for both males and females. The literacy rate has steadily increased and, as of 2015, is 93.9 percent for Lebanon's total population; the female literary rate is now 91.8 percent and 96 percent for males (CIA 2017).

Primary, Intermediate, and Secondary Education

In 1998, Lebanon's educational curriculum was adapted to mirror several other countries. In this system, children (male and female) spend six years in primary education, three in intermediate education, and the last three years in secondary education (StateUniversity.com 2017). After finishing the secondary program, the student will have earned a baccalaureate certificate, the equivalent of a French school diploma. More girls are completing their education than before, but it is not uncommon to have a young woman leave school during her secondary years for traditional or socioeconomic reasons. Only 53 percent of adult women (compared to 55.4% of adult males) complete secondary education (HDR Briefing Notes 2016).

Education for Refugees

The Lebanese Ministry of Education has issued a memorandum opening all schools to refugees and waiving entry and book costs. In many areas, Lebanese students are vastly outnumbered by refugee students; meeting students' needs is a particular challenge across the different needs they bring to the classroom. In rural areas, the placement of some public schools can make it difficult for students to access them in harsh weather conditions. Refugee students have reported safety issues, harassment, and violence that lead to escalating dropout rates. Refugee students that continue to attend public schools tend to face problems such as language barriers, low teacher capacity, overcrowding, inappropriate infrastructure, and challenges understanding different and new curricula.

Health

The civil war resulted in many problems in Lebanon's health care system. In the Middle East and North Africa (MENA) region, Lebanon's health care is one of the most expensive. Due to the expense, the vast majority of Lebanese citizens are completely dependent on public health care; it is rare for people to be able to afford private insurance.

Access to Health Care

Health care access varies widely across the country. The utilization of the public sector's health service in Lebanon can be low due to the perception of low- or poor-quality care and the difficulty in gaining access to a health care facility. In Lebanon, there are 820 primary-level service

delivery points (managed primarily by nongovernmental organizations) that provide a range of health care services, including providing medications. There are 3.2 physicians for every 1,000 people, and the country spends 6.4 percent of its gross domestic product (GDP) on health care (CIA 2017). More than 87 percent of the population lives in an urban area, and access to improved drinking water and improved sanitation facilities is near 100 percent (UNICEF 2016).

According to a survey done by SWMENA, approximately half of men and women say that they are able to afford necessary medication and regular visits (SWMENA 2011). Lebanese women's ability to afford regular medical visits is not dependent on whether they are working; rather, the affordability of medical care is heavily based on whether the women have an employer that can provide health insurance. Forty-one percent of women who do not have health insurance from an employer are able to afford regular health visits and needed medication, but the women who are insured through an employer have a 71 percent chance of being able to afford medication and regular visits. When it comes to women's services, such as gynecologist and obstetrician visits, approximately 72 percent of Lebanese women have utilized these services at least once by the time they are 18 years old (SWMENA 2011).

Maternal Health

The fertility rate is only 1.5, and the majority of Lebanese women use health care services during pregnancy. Factors such as age, culture, educational attainment, religion, and economic status affect women's choice of where and how to give birth (WHO 2015). Younger women are more likely than older women to access prenatal care. For women 15–19 years old, 98.8 percent seek prenatal care, and for women 35–49 years of age, it is slightly lower at 91.7 percent. Women are more likely to seek prenatal care for a first pregnancy (99.2%). Reproductive health outcomes have improved in Lebanon over the past years, with 96 percent in 2000 and 98 percent in 2004 (UNDP 2016). Twelve out of every 1,000 babies are born to adolescent mothers, those aged 15–19 years (UNData 2016).

Though only 53 percent of Lebanese women use contraceptives, 95.6 percent attend at least one antenatal appointment (UNICEF 2016). Ninety-two percent of pregnant women are under supervision of a doctor, 5.5 percent are under the care of nurses or midwives, and 2.2 percent

are in the care of a wet nurse or a family relative (UN Women Watch 2004). Ninety-eight percent have a skilled birth assistant attend their births (UNICEF). According to the 2000 UNICEF perinatal survey, 9.5 percent of pregnant women were hospitalized for antenatal problems. Statistics indicate that 88 percent of births take place in hospitals (UN Women Watch 2004). Maternal morbidity reached 21 percent in 2002 (Chaaya et al. 2002). Lebanon has made great progress in reducing maternal mortality at regional and national levels. In 1990, 64 women per 100,000 died due to maternity-related causes; in 2013, only 16 per 100,000 did (WHO 2015). This progress is attributed to the increased awareness of the importance of prenatal care and the improved quality of reproductive health care packages available to pregnant women.

Infant mortality rates as of 2016 in Lebanon were 7.60 per 1,000 live births (CIA 2017). More than 90 percent of deaths in children under the age of five occur in the neonatal period or within the first four weeks of life (Samad 2008).

Abortion

Abortion is illegal in Lebanon, under Articles 539–546. Because it is illegal and religiously unacceptable, there are few to no abortion statistics. If a woman is found guilty for inducing her own abortion or if she receives an abortion by other means, she can be imprisoned for six months to three years. If a woman does have an abortion, it will likely be performed in nonhygienic conditions by an untrained or unscrupulous practitioner, making it incredibly unsafe.

Diseases and Disorders

HIV/AIDS

In Lebanon, HIV/AIDS cases are rare. The first of HIV/AIDS was diagnosed in 1984, and there have been 1,056 cases as of November 2007. However, according to the World Health Organization (WHO), an estimated 2,500 cases of HIV/AIDS go unreported. In 2006, adults 31–50 years of age comprised 52 percent of the cases diagnosed. Reports show that for every female there are four males infected with HIV/AIDS (UNDP 2016).

Forty-one percent of HIV/AIDS cases are contracted during travels outside the country. The number of locally transmitted cases has been increasing in recent years. The primary source of the infection is sexual, leading to 70 percent of all cases; 56 percent of the cases involved

heterosexuals. Only 2.2 percent of cases were transmissions of the disease from mother to child, and 5 percent of carriers contracted the disease from drug use (UNDP 2016). In 1993, 6.4 percent of patients receiving blood transfusions were infected. According to the National AIDS Program (NAP), studies show that awareness about HIV/AIDS and how it is transmitted is high. Unfortunately, this has not led to an increase in cautionary measures for individuals. The use of preventative measures, such as condom use, is still relatively low in Lebanon.

Tuberculosis

The National Tuberculosis Program's epidemiological data states that the number of tuberculosis (TB) cases decreased from 1993 (25 per 100,000) to 2006 (9.38 per 100,000). Treatment achievement rates are 92 percent (UNDP 2016). In Lebanon, the town with the highest rate of TB is Bekka, and the lowest is the Province of Nabatieh Mohafazats, in the southern part of Lebanon.

Malaria

Lebanon was announced to be free of malaria in 1963 by the World Health Organization. Only a few outbreak cases have appeared in the country since then. The few cases diagnosed in 1996 and between the years 1998 and 1999 were contracted in countries that have ongoing malaria outbreaks.

Health Care for Refugees

By the year 2015, Lebanon's refugee population had hit an all-time high. With this vulnerable population growing, international health assistance is necessary to provide health care for the refugees in Lebanon. Due to the current regional humanitarian crisis causing problems to the already unstable national health care system, the Lebanese government needs to adjust how Lebanon's Ministry of Health (Blanchet et al. 2016) provides health coverage to Syrian and Palestinian refugees.

Employment

Since the 1970s, women's contributions to the Lebanese workforce have been slowly increasing, from 21 percent participation by women in the workforce in 1980 to 27 percent in 2007 (Kelly and Breslin 2010). This rise in the number of Lebanese women in the workforce can be connected to societal and governmental commitments to women's education. As of 2010, 24 percent of employed

Lebanese women were working in such professions as business, government, law, and medicine (Tailfer 2010). Men are more likely to hold senior management positions, whereas women are more likely to occupy lower positions. Most women working in the labor force tend to be younger or single. Women often quit work or decrease hours when they get married or become mothers.

Maternity Leave

Before April 2014, women in Lebanon were eligible for only 7 weeks of paid maternity leave. Now, they are entitled to 10 weeks of paid maternity leave. This maternity leave can begin up to 4 weeks before the baby's due date. Some Lebanese women's employers will allow them to extend their leave an extra month without pay. Many women in Lebanon still believe 10 weeks is not long enough.

Unequal Pay

In Lebanon, women earn about 71 percent of the earnings that males make (Dah et al. 2006). Although women and girls are reaching higher levels of education, they are still paid notably less than their male counterparts.

Family Life

Lebanese families are usually patriarchal in family structure. It is common for families to live in the same area or building as their relatives. Although it is becoming more common for families to have both parents in the labor force, many still keep the traditional gender divisions, where the father joins the labor force for wages and the mother is responsible for housework. Even if a wife or mother works, she is still responsible for the housework and children (unless they are able to afford a housekeeper). In some rural regions, women are limited to gender-segregated work, such as housekeeper or wet nurse. Despite some areas or religions that limit women, since the 1970s, more women have entered into paid work and become more visible in society (Ghaziayman 1997).

Religion plays a big role in marriage and family expectations. Arranged marriages are rare in Lebanon today, but they are still practiced in some families. Child brides are more common with the increase of refugees in Lebanon, but law enforcement is addressing this problem. Access to divorce varies, depending on the couple's religions. Civil marriages are popular among couples from different faiths to avoid sectarian complications around different rules

for marriage contracts. The house and property of those getting divorced often go to the person whose name is on them, which is usually the husband.

LGBT and Sexuality

Because of significant religious influence, purity in women is still valued, and premarital and extramarital sexual relations are frowned upon by much of Lebanese society. Prostitution is legal in Lebanon, but it is socially looked down on. As of 2013, homosexuality was illegal and punishable by imprisonment. However, some areas demonstrate more leniency than others. Berirut, for instance, is less conservative about sexual relationships between men and women and between same-sex couples. This has led to a rise in LGBT rights activity there. Despite the criminalization of homosexuality, same-sex adoptions are legal.

Politics

In Lebanon, the different religious communities hold their own type of political power. Each religion can dictate its own personal status laws that address legal procedures regarding marriage, divorce, and inheritance. For Muslims, sharia courts handle these, with different hearings for Sunni and Shia followers. The ecclesiastical courts have jurisdiction over personal status issues for Christians. To avoid these types of systems, many people seek civil marriages, especially if the couple comes from two different religious backgrounds and there could be a conflict between the religious and legal systems.

The Lebanese legal system is progressive in regard to women's rights, especially compared to other Arab states. Unfortunately, Lebanese gender equity laws are not always applied in the ways they were designed and desired. Sexist patriarchal norms remain hidden within the penal code, sectarian control of the personal status laws, and nationality laws (Kelly and Breslin 2010). The many women's organizations in Lebanon have lobbied for improvements for women. Over time, the Lebanese government has moved to upgrade the legal status of women, but it has been unable to get approval for major reforms in the parliament. Women hold only 3.1 percent for the parliamentary seats (UNDP 2016).

Participation in Government

Over the years, Lebanese women have been able to make political progress. By 1952, they had achieved the right to

vote. In 1991, the first woman was elected into parliament. The lower house of parliament had 4 of the 128 seats occupied by women in 2011.

Women have earned law degrees since the 1930s and began serving as judges in the 1960s; however, the religious courts still prohibit women from serving as judges (UNICEF 2016).

Feminist Movements

The first wave of the feminist movement in the Middle East was active from 1940 to 1960. The majority of its creators and supporters were affluent and/or educated women and men. The focus for this wave was voting rights, education, and improvements for the representation of women and mothers. This period was influenced by religious reformists and liberal feminist ideology. Lebanese women's rights activists seized the opportunity of print culture to promote charity organizations, journalism, and educational programs.

In 1920, a women's advocacy group called the Lebanese Women Union was the first group founded to bring leftists and Arab nationalists together. Another advocacy group, the Christian Women's Solidarity Association, emerged in 1947 and was made up of haute bourgeoisie representatives and elite women. This second group wanted to create 20 Christian organizations all over Lebanon. By 1952, the Christian Women's Solidarity Association and the Lebanese Women Union had come together to form the permanent organization of the Lebanese Council of Women.

The second wave was active between 1960 and 1990. In the 1960s and 1970s, several committees for women were created within the political parties so they could raise awareness and discuss important issues (Stephan 2014). Some examples of these organizations are the League of Lebanese Women's Rights and the Women's Democratic Gathering. In 1975, the 15-year Lebanese Civil War broke out, and feminists turned their energy to ending the violence and negotiating peace. Throughout the second wave, activists did their best to promote women's rights and justice along with the need for peace.

The third wave started in 1990 and lasted until 2005. Feminists used amplified global attention on women's rights to promote gender-related issues and raise funds for the advancement of women's rights issues in Lebanon. In the 1990s, the women's organizations partnered with the Lebanese government to provide services for women and imagine the future of equality between women and men.

In March of 1999, the first coalition of the National Coalition to Eliminate All Forms of Discrimination against Women was founded. In 1995, two organizations were formed during the Beijing United Nations Conference on Women: the National Commission for Lebanese Women (NCLW) and the National Committee for the Follow Up of Women's Issues. The Lebanese Council of Women includes organizations that focus on rights, education, research, and international development projects for women. Finally, the Lebanese Council to Resist Violence against Women is a significant women's rights organization that was started in 1997 to address violence against women.

In March of 2005, civilians in Lebanon protested the assassination of former prime minister Rafik Hariri, which put pressure on Syria to pull its troops from the country. With the involvement of the United Nations, Lebanon was granted the right to complete national sovereignty. Individuals both inside and outside of Lebanon recognized the large part women had played in these events, and this led to a surge of political movement among women. A few feminists realized this was an opportunity for a renewed woman's rights movement, and many organizations, such as the Collective for Research and Training on Development-Action (CRTD-A) and KAFA, became the building blocks that continued the work of the previous waves of the women's movements. Many new organizations also appeared at this time that had the primary goal of raising awareness of domestic violence, stopping violence against women, and ending disrespect of female workers (Stephan 2014).

Many feminists began to advocate for rights to their own bodies, including positive self-image. The groups specifically fought for the right to choose a marriage partner, rights to abortion access for women who needed them, full citizenship rights, and the right to participate in politics. Other issues, such as protecting the environment and economic sustainability, are also addressed by feminist activists, and LGBTQ rights have more recently been incorporated into the movement.

Women's Associations, NGOs, and Nonprofits

Currently, Lebanon has an operating woman's rights movement that has been involved in drafting and advocating for amendments addressing discriminatory laws. Unfortunately, these movements have been slowed by the ongoing conflicts and wars. During the civil war, the movement focused on social and relief services. After

the war, the movement gained traction, and feminist activists focused their efforts on the renovation of the laws. Three groups were active in changing the laws; the Lebanese Women's Council, the National Focal Point for the Elimination of All Forms of Discrimination against Women, and the Lebanese Women's Network are primary members of the NGO alliance. One NGO, KAFA: Enough Violence & Exploitation, proposed a report to the 40th session of the CEDAW committee in 2008. This report focused on Lebanon's third periodic report, which outlined a position for migrant domestic employees and women in sex work. An auxiliary report on Palestinian refugee women was submitted with the original report (UNICEF 2016).

Citizenship and Nationality

In Lebanon, women who marry foreign spouses may not pass their Lebanese nationality to their children or spouse, but Lebanese men can. The only time that a woman can give her nationality to her children is if the father of the children is unknown. Children who are born to a Lebanese woman and a non-Lebanese man will not be granted citizenship, but they will be considered residents of the nation. A new law is being studied that would allow women to have the same rights as men to pass on their nationality to their children.

Religious and Cultural Roles

Fifty-four percent of Lebanese people are Muslim, 27 percent Sunni and 27 percent Shia. Christians make up 40.5 percent of the population, and another 5.6 percent of Lebanese follow the Druze faith. Very few are Jewish, Buddhist, or Mormon (CIA 2017).

Religious Laws

The discrimination of women is common in all of the religions practiced in Lebanon. According to Evangelical Christian rules, females at the age of 14 can be married and males at the age of 16. A woman who practices the Druze religion must have her male guardian's permission to marry if she is under the age of 21. For women in the Sunni and Shia communities, two women are equal to one man for witnessing a marriage. In Sunni Muslim families, a husband's children from a previous marriage can reside in his house without consent of his new bride, but the reverse is not true.

Issues

Forced Labor and Trafficking

Sex trafficking and forced labor are issues that women face in Lebanon. Women who have traveled to Lebanon with the assistance of a job recruitment agency for domestic service work often find themselves in forced labor situations. The employers often place restrictions on movement, withhold passports, verbally abuse, threaten arrest and deportation, withhold wages, and even commit physical assault on these workers. Some employers force foreign domestic workers to stay in their place of residences without permission to leave for any reason, and they often threaten workers with the loss of legal immigration status. It is not only domestic service jobs that are used to lure people to Lebanon, but employment agencies also make false lucrative job offers in other fields as well.

Sex trafficking is a growing problem in Lebanon. Some women enter Lebanon with a government's artist visa, which allows them to work in the adult entertainment industry, primarily as dancers. These visas put some of the women at risk for forced prostitution by means of withholding of passports or wages and physical and sexual abuse. The Lebanon government has done little to investigate or stop these abuses.

Refugees Forced Labor and Trafficking

Refugees in Lebanon are vulnerable to forced labor and sex trafficking due to their vulnerable financial situation. Some young Syrian refugee girls are being pushed into early marriage, which in addition to the dangers of child marriage can also put them at risk for sex trafficking or forced labor. Some refugees are forced into labor with little pay, or they incur debts of entry into Lebanon that they need to repay.

Gender-Based Violence

Women are often scared to speak about the violence committed against them for fear of shame or scandal. Male dominance and lack of legislation protecting women from violence are common reasons why women do not report violence they experience. Due to the pressures of war and the troubled economy, Lebanon has experienced a rise in the number of cases of violence against women. Several institutions not affiliated with the government counsel women to come forward and speak about the abuse that is happening to them (UN Women Watch 2004).

Lebanese Women in the Media

Although high numbers of women are graduating with media degrees, women are still missing from leadership positions within the media. Very few women work in political journalism. The discrimination that women face is often practiced during the recruitment phases.

Criminalization for LGBTQ

Lebanese penal law criminalizes homosexuality by outlawing sexual acts that go against the laws of nature; punishment can be up to one year in prison. However, in a recent landmark case, a judge declared that sexual acts between a transgender woman and a man are not unnatural. Activists in Lebanon hope that this ruling will eventually lead to the dismissal of this law. In 2013, it was affirmed that homosexuality is not a mental illness that can be cured; despite this finding, feelings and beliefs about homosexuality are still largely inhospitable.

Refugee Safety

In Lebanon, approximately 45,000 Palestinian refugees have joined the 300,000 Palestinian refugees already residing in the country. In addition, 1,143,000 Syrian refugees have gone to the UN High Commissioner for Refugees (UNHCR) to register as refugees. Registering can grant assistance but not legal status as a resident of the country. Refugees who cross an official border are given a six-month permit, which allows residency for the six months and includes one renewal possibility. Once this possible renewal has expired, a renewal fee is charged for additional renewals. If the refugee is found to have "absent legal status," there is a chance of prison time for being in the country illegally. This measure was produced in 2014 by the Lebanese government in hopes of eliminating or reducing the number of refugees in the country (HRW 2015). Note that at the time of this writing, the Syrian Civil War is in its sixth year and conflicts between Israel and Palestine have been ongoing since 1948, making these short time frames unhelpful in addressing the refugee crisis in the region.

Lesotho

Overview of Country

The Kingdom of Lesotho, originally known as Basutoland, was founded during the 1820s by King Moshoeshoe I (1786–1870). Its inhabitants are known as Mosotho (singular) and Basotho (plural). As Afrikaners and Boer trekkers began settler and territorial encroachment across South Africa during the 1830s, the king wisely invited missionaries to come live among his people as a means of protection. In the 1840s, a strategic alliance was agreed upon between the Basotho and the British Cape Colony, which was followed by a series of wars between the Basotho, the British, and the Afrikaners. In 1868, Basutoland became a British protectorate, and in 1871, the Basotho consented to annexation to the Cape Colony. Nearly 100 years later, with King Moshoeshoe II (1938–1996) at the helm, Lesotho gained its independence from the United Kingdom on October 4, 1966.

Territorially, Lesotho is surrounded by South Africa and has the distinction of being one of only two countries in the world to be surrounded by another country. It is a very poor nation, with about 40 percent of its inhabitants living below the international poverty line (the equivalent of USD\$1.25 per day). Ranked among the 49 least developed countries (LDCs), Lesotho continues to work hard to achieve political stability and improved economic performance, but the country continues to face challenges in achieving autonomy and self-sufficiency because of its heavy economic dependence on South Africa.

The people of Lesotho are ethnically homogenous. Almost 99 percent are Basotho, and the country has two official languages, Sesotho and English, although Zulu and Xhosa are spoken by a small percentage of its inhabitants. The country's population is nearing 2.1 million, slightly more than half of which are women (50.65%), and 80 percent of the population live in the lowlands and engage in agricultural pursuits (CIA 2017).

Education

Historically, education has played a large role in the lives of the Basotho. Ever since the mid-1800s, Lesotho has had the distinction of being one of the first African countries in which mission schools were established. By the time of its independence, nearly 1,100 primary schools, 21 secondary schools, 4 vocational schools, 7 teacher training colleges, and 1 university had been established throughout the country. As evidence of an ongoing commitment to education, Article 28(a) of the Lesotho Constitution states that the country "shall endeavor to make education available to all and shall adopt policies aimed at securing that education is directed at the full development of the human personality and sense of dignity and strengthening the respect for human rights and fundamental freedoms." In an effort to make education accessible to all, the government enacted legislation in 2010, which provides free education for all its citizens. This commitment works in tandem with the vision of the Ministry of Education and Training that the people of Lesotho "shall be a functionally literate society with well-grounded moral and ethical values." Primary school is compulsory for girls and boys between the ages of 5 and 13 years of age, and enrollments are high for both rural and urban learners. Learners may then go on to junior secondary school (ages 13–16), high school (ages 16–18), technical secondary school (ages 16–19), and teacher training or education in technical

subjects (ages 18–20). The country as a whole maintains a high literacy rate, and among youth, girls tend to be more literate and have higher retention rates than their male counterparts. This is largely because boys are often required to leave school to go to work as livestock herders or migrant laborers.

Even with high retention of girls in school, the education of youth of both sexes is challenged by poverty; health issues, including HIV/AIDS; low attendance; high failure and dropout rates; and student violence in school. A report on adolescent behavior notes that "only 36 percent of males and 57 percent of females complete primary school, with only some 6 percent of males and 11 percent of females completing secondary education" (Dugbaza and Nsiah 2002, 194). Increasing school violence, which includes verbal aggression, physical abuse or compulsion, mental cruelty, bullying, and more, also threatens the educational process (de Wet 2007, 673–675).

In addition to student-to-student violence, young learners may also encounter teacher-to-student violence because corporal punishment is permitted in Lesotho. It is not uncommon for some teachers to feel empowered to perpetrate violence against students. There have been reported cases of sexual and physical abuse of students by teachers as well as verbal abuses within the classroom setting. These have included dark sarcasm, insults, threats, hounding, put-downs, spiteful statements, branding students as troublemakers, and inflicting lengthy timeouts in the corner of the room (de Wet 2007, 676). Due to customary laws still being practiced, and the fact that gendered hierarchies are pervasive in this country, young girls are particularly vulnerable to school violence. This often results in psychological, sexual, or physical harm because of their subordinate status within Lesotho culture.

Lesotho youth under the age of 18 make up half the population, so overcoming challenges to effective and safe education for them is of vital importance in ensuring a positive and productive future for the country. To encourage completion of secondary school and to improve the long-term educational success of youth, the government now offers programs that provide training opportunities for postgraduation employment. The Ministry of Gender and Youth, Sports and Recreation, for example, piloted the Youth Volunteer Corps Project (LYVCP) in 2010 with 153 volunteers who were placed in internship-like positions in public-sector organizations and government ministries. The long-term hope of this program is for all secondary school graduates to participate in such programs. The goal

is to increase youth employment, to help fight the spread of HIV/AIDS among youth, and to help shape young people as civic-minded contributors to Lesotho's ongoing development. Nearly 800 students graduate annually from Lesotho secondary schools, and these emergent youth programs improve youth's chances for promising job opportunities as well as offering hope for leading healthy and productive lives.

Though most youths do not pursue higher education, those who wish to do so may attend the Lesotho Agricultural College, the National University of Lesotho, or the University's International School. In terms of growing efforts toward gender equality, it is significant that the UN Division of Statistics cites that Lesotho ranks among the highest of all sub-Saharan African countries with 55 percent of women enrolled in tertiary education. It is noteworthy that the faculty of the university is 43 percent women. In light of the observation that, in Africa, "the benefits of one educated woman, given the crucial roles she plays in society, are immense" (Azevedo and Nnadozie, 2003), these advances in the female presence in higher education bodes well for the future opportunities for young women in Lesotho. And for Lesotho youth in general, it appears that they are well positioned to benefit from increased attention to improvements in educational opportunities that range from curtailed school violence to increased youth-focused developmental programs and projects and other initiatives aimed at offering vocational training for them.

Health

Access to Health Care

Lesotho spent 10.6 percent of its gross domestic product (GDP) on health care in 2014 (WHO 2015). Life expectancy is only 55 years; women live about three more years than men. The life expectancy is increasing, but it is lower in Lesotho than in surrounding countries in the region. Thirty-six percent of the population is under the age of 15 (WHO 2015). Only 26 percent of the population lives in urban areas, and this impacts people's access to health care. While there are hospitals and facilities throughout the country, they are predominantly located in more urban areas, and aging buildings are increasingly an issue; one hospital had to close permanently due to the building being unsafe, and a replacement is not yet built. Three-quarters of the rural population does not live within walking distance of a health facility ("Healthcare" 2015). The Ministry

of Health is addressing retention of and the training of new health care workers. In 2013–2014, one-third of the doctors were sent to Zimbabwe for training, and 39 nurses were provided with midwifery training to address maternal and infant success rates. There are only 200 doctors and 4,000 midwives in the country. This is 1,300 too few doctors and 2,000 too few midwives, according to WHO recommendations ("Healthcare" 2015).

Improved drinking water is available to 77.7 percent of the population (WHO 2015), but the disparity between urban and rural areas is evident here as well; 90.8 percent have access to clean water in urban areas, compared to 72.7 percent in rural areas (UNICEF 2017). Only 26.3 percent have access to sanitation facilities (WHO 2015). Equity gaps continue to persist, especially in rural and remote areas.

Maternal Health

More than 47 percent of women in Lesotho use some form of contraception, and the fertility rate in 2013 was 3 per woman (WHO 2015). For a woman aged 15–49, there is a 20 percent probability that she will become ill or die from maternal causes. The maternal mortality rate was 490 per 100,000 in 2013. This is better today than in past years, but it remains higher than other countries in the region. More than 70 percent of women attend 4 or more antenatal appointments, and 62 percent are attended by a skilled birth assistant for delivery (WHO 2015). More than 58 percent of women give birth in a health care facility ("Healthcare" 2015). We again see a disparity by area, with 88.1 percent of urban women compared to 53.5 percent of rural women having a skilled birth attendant during childbirth. The mortality rate for children under the age of five is 98 per 1,000 children, which is higher than it was in 1990 at 86 per 1,000 (WHO 2015).

Abortion prohibitions follow common law adopted from Roman-Dutch law. It is prohibited except in cases of necessity, but there is disagreement as to what is considered a necessity. Little information about prevalence is available, but it is suspected that abortion is common. Unsafe abortions are dangerous and can contribute to lasting health issues for women.

Diseases and Disorders

Lesotho reports a 95 percent vaccination rate, including 92 percent of children receiving the measles vaccine (WHO 2015). A recent tuberculosis (TB) epidemic was

devastating. Lesotho is the fourth-highest country for incidences of TB in the world (“Healthcare” 2015). For women, cervical cancer is the most common cancer and the leading cause of cancer deaths (“Healthcare” 2015). Malnutrition remains a pervasive problem in the country.

Hypertension (or high blood pressure) is the most common noncommunicable disease risk (35.9%), followed by diabetes (12%) (UNICEF 2017). Hypertension accounts for 9 percent of outpatient visits to health facilities (“Healthcare” 2015).

HIV/AIDS

As with many African countries, HIV/AIDS has reached pandemic levels in Lesotho since its first appearance in a patient in the Butha-Butha district in 1986. Index Mundi ranks Lesotho 21st in regard to HIV/AIDS-related deaths among adults and children over a representative 10-year period. During this time, 16,000 cases were documented in 1999 and 14,000 cases in 2009.

HIV is the leading cause of death in Lesotho. In 2012, 582.9 per 100,000 people died from HIV (WHO). Twenty percent of children’s deaths are due to HIV (WHO 2015). Women who are living with HIV are four times more likely to develop cervical cancer (“Healthcare” 2015). TB is also a common coinfection with HIV and contributes to 46 per 100,000 deaths (WHO 2015); 80 percent of people with TB are also infected with HIV (“Healthcare” 2015). As of 2012, 190,000 people in Lesotho were living with HIV, and 38,000 were children (UNICEF 2017). A staggering 150,000 children have been orphaned due to parents dying from HIV/AIDS, compared to 70,000 children orphaned for other reasons (UNICEF 2017).

According to UNICEF, in 2012, there is an 8.4 percent prevalence rate of HIV; 10.7 female and 5.8 male for people in the 15–24 age range. When looking at 2008–2012, we see additional differences between young women and men in comprehensive knowledge of HIV and condom use when having sex with multiple partners. More young women had more comprehensive knowledge (38.6% to young men’s 28.7%), but more young men used condoms (60.3% compared to 44.9% of young women). Studies have demonstrated that it is more difficult for women to negotiate using condoms, even in consensual relationships. There is also disparity between urban and rural and the richest and poorest people in the country. Young people living in urban areas or from the richest 20 percent of the population have higher rates of comprehensive knowledge about

HIV than those from rural areas or from the poorest 20 percent (“Healthcare” 2015).

Presently, the female population continues to be hit very hard by HIV/AIDS. Causes of the rampant spread of the disease are varied and reflect the multiple ways girls and women are made vulnerable. These range from natural interest in expressing their sexuality and the desire for intimacy, to the harsh realities of sexual violence, marital rape, and the fact that women have no legal protections regarding relations with men.

This is especially true in rural communities where, according to common-law practices, upon payment of the *lobola*, or bride-price, a woman becomes the property of her husband upon marriage, and he is entitled to have sex with her anytime he wishes, even if it is against her will. This sense of male sexual entitlement creates a power imbalance that disempowers women, who are often considered as mere “blankets” for men. Because women have no say in sexual matters, their recourses for ensuring safer sex practices, such as the use of condoms as protection against the spread of HIV/AIDS, are limited. Equally challenging is the prevalence of stigmas and silence around sexual violence and marital rape, and because women are largely trapped in relationships within which they are economically dependent on males for financial support, they are often reluctant to speak out about the abuses they endure. Unfortunately, those women who do courageously speak out are often victimized by friends, family, and law enforcement as well as the legal system.

CARE International has worked to offset such challenges by providing education and assistance to women in Lesotho regarding HIV/AIDS and gender-based violence, and SHARP (Sexual Health and Rights Promotion) has been very helpful in advocating for gender and human rights by providing information and training focused on reducing the vulnerability of at-risk persons while increasing the safety of sexual contact between partners.

Employment

Although Lesotho maintains itself as an independent country, its economic dependence on South Africa has limited its ability to become self-sustaining in its own right. For many years, Basotho migrant laborers have crossed the border to seek factory, diamond mine, and farm work in South Africa. In the process, whites have benefited from hiring Basotho workers as cheap labor instead of employing indigenous South African blacks. Currently,

most migrant workers are male, but prior to enactment of the Aliens' Central Act of 1963, Basotho women also worked in South Africa as domestic workers and beer brewers. However, this act now requires travel documentation for a foreign African to enter the country. Then when the Black Laws Amendment Act was issued, the entry of migrant workers was further restricted to men specifically recruited to work on South African farms and in the mines.

Overall, Basotho men have more lucrative avenues for earning money than women, but within Lesotho village communities, women play prominent roles in agricultural production and serve as the center of the country's domestic economy. Within the community, none of the land is privately owned, and the main revenue crops are maize and sorghum. Peas, wheat, beans, and potatoes are usually harvested for household sustenance. Some women also raise chickens and pigs and brew and sell beer. Communally, village women participate in a form of sharecropping (known as *seaholo*), and they gather for clearing, planting, and harvesting the crops (called *matsema*). All aspects of this work are performed by women except plowing, which is done by sons or husbands who may be home from their migrant laborer jobs.

On the one hand, this work keeps village women very busy, but the output is rarely profitable because there is little to no market for the sale of cash crops in Lesotho. On the other hand, being at the center of agricultural production provides Basotho women leadership opportunities within their traditional communities, and this enables and empowers them by becoming involved in cooperative ventures together.

Family Life

Inevitably, because of the influx of wage-labor migration to South Africa, family life for many Basothos has been disrupted in ways that have changed the whole nature of family structure and marriage in Lesotho culture. The conjugal separation of wives and husbands for extended periods of time has offered women increasing opportunities for autonomy, agency, and empowerment in their rural households, but these migratory practices have undermined the stability of marriages and the long-term functionality of many households. Often, a wife has maintained the rural household alone for as many as 20 years or more, and when the husband returns from his laboring role as primary provider, he finds an unprofitable agricultural homestead. Many strains are put on familial relations, and

it is not uncommon for marriages and families to dissolve because of long-term migrant separation. Women faced with this reality are forced into situations where they must find work to support themselves and their children without any assistance from their former spouses.

Marriage

Although general and customary laws are typically applied side by side in Lesotho, the country remains strongly patriarchal, particularly in rural areas where traditional customary marriage laws are strictly followed. Prior to marriage, a Basotho woman is considered a perpetual minor, with her father considered as her guardian under customary law. Once she marries, guardianship transfers from father to husband, and if he dies, it transfers to the husband's male heir.

Although it is traditional under customary law that women's rights are limited in terms of property and inheritance, the Lesotho government has taken strides in its promotion of gender equality by enacting the Married Persons Equality Act of 2006. This act limits the marital power of a husband, and it also allows his wife to establish credit in her own name. The positive side of this act is that it offers empowering protections for Basotho women; however, the negative side is that many women in Lesotho do not yet know that such an act exists on their behalf.

While customary laws limit the choices and mobility of Basotho women in rural areas, there are women in urban areas who have begun to engage in more liberal relational practices. For example, due to the prominence of male labor migration to South Africa, it has become increasingly prevalent for marriage to be delayed, or bypassed altogether, in favor of cohabitation. Educated Lesotho women, in particular, tend to prefer not to marry migrant workers and are more likely to become involved in relationships with a series of multiple partners, each of which offers her different amenities. She may, for example, have one man who provides shelter, another food, another clothing, and others offering transportation, and so on.

Politics

The governance structure of the Kingdom of Lesotho is a parliamentary constitutional monarchy with two branches. In the executive branch, the king serves as a figurative head of state, while the prime minister functions as the true head of the government with executive authority. In the

legislative branch, the Parliament has two chambers. The National Assembly includes 120 members elected for five-year terms: 80 single-seat constituencies and 40 seats with proportional representation. The Senate has 33 members. The Lesotho Constitution ensures an independent judicial system that consists of the High Court and the Court of Appeal, with traditional courts found in rural areas, and it also protects basic civil liberties, which include freedom of religion, freedom of speech, freedom of the press, freedom of association, and freedom of peaceful assembly.

Regarding women in Lesotho politics, the first female parliamentarian was appointed in 1965 (CIA 2017), the same year Lesotho granted suffrage to women. And although the country overall remains deeply patriarchal, several laws have been enacted to increase the number of women decision makers in both the central and local spheres of governance. These include the National Assembly Elections (Amendment) Order (2001), the Local Government Elections (Amendment) Act (2004), the Local Government Elections (Amendment) Act No. 4 of 2011, and the National Assembly Electoral Act (2011). In effort to promote gender equality as a fundamental human right, the Southern African Development Community (SADC) Protocol on Gender and Development (2008/2010) was signed and ratified. As a registered member of the Independent Electoral Commission (IEC), the country is mandated to foster gender equality and to facilitate women's participation in the political arena.

The adopted SADC quota for more equitable female representation in public and political life sets a target of 30 percent for seats occupied in Parliament by women. Overall, Lesotho has taken strides to respond affirmatively to mandates from regional, national, and global influences to increase equal representation, but its first efforts have fallen short of the goal. When general elections were held in Lesotho in May 2012, for example, only 31 women were elected (representing just more than 25%). A year later, the SADC encouragingly reported that the country was positioned to make more rapid progress in increasing women's representation in Parliament.

Statistical information from the Inter-Parliamentary Union (2014) indicates that the country currently ranks 44th out of 189 countries worldwide in its percentage of women holding office in Parliament. In the lower house election held in May 2012, out of 120 seats, 32 women were elected (averaging just over 26%). In the upper house election held in June 2012, out of 33 seats, 9 women were elected (averaging just more than 27%). It is noteworthy

that 22 seats held in the upper house (or Senate) are hereditary, and the other 11 are nominated by the king; 9 of these seats are currently held by women.

Within the cabinet, women also hold leadership roles, and 5 women currently represent almost 24 percent of its 21 ministers (reflecting a drop from the 32% of women cabinet members in 2009). In the judiciary, 65 percent of the country's judges are women, 42 percent are magistrates, and 3 of its 7 deputy ministers are women. On the local level, 49 percent of the government is represented by women, and, with a ranking of 49 percent, Lesotho has the most women elected to rural councils of all sub-Saharan countries. Other distinctive representation by women includes a woman chairperson of the Independent Electoral Commission (IEC) as well as 40 percent of the directors in central government and the Central Bank governors being women.

In general, the effectiveness of female-influenced governance is defined by women politicians being able to promote women's issues while mobilizing empowered women's support in their parties. While gender equality has not yet been achieved, there has been an encouraging governmental commitment since 2005 to promote basic civil liberties for all Lesotho citizens—female and male—as well as to increase women's presence in politics.

Women's Movement

The Social Institutions & Gender Index (SIGI) provided rankings in 2012 that measured discrimination against women in more than 100 countries to assist researchers and policy makers in assessing gender-related inequalities reflected in the areas of education, employment, and more. Interestingly, Lesotho was not included because of missing data in one or more of the following variables among others, early marriage, discriminatory inheritance practices, violence against women, son bias, restrictions on access to public space and restricted access to productive resources (SIGI 2014). There is information on the status of women in Lesotho that has been tracked by the annual Global Gender Gap Index issued by the World Economic Forum. In 2014, Lesotho ranked 38th out of 136 countries with the following rankings in four key areas: health and survival (60th); educational attainment (first, along with 25 other countries); economic participation (32nd); and political empowerment (57th).

While this empirical data proves somewhat statistically helpful in assessing the overall status of Lesotho women,

it does not demonstrate the degree to which women have been active in women's movements in Lesotho. Ever since the country ratified the UN treaty on the Convention of the Elimination of All Forms of Discrimination against Women (CEDAW) in 1995, women's agency has increased, and the country in general has demonstrated a cultural commitment to seeking women's equality. Legislatively, action has been taken with the enactment of the Sexual Offences Act (2003) and the Gender and Development Policy, in addition to programs and policies being implemented to improve gender equity. While encouraging, progress in effecting sustained change and improvement has been slow, and Basotho women still suffer from gender discrimination because of their infantilization within the traditional patriarchal culture.

As Lesotho moves forward in achieving gender equality, it is incumbent upon women activists to continue to fight for the elimination of gender-based violence and to continue to develop advocacy-based nongovernmental organizations (NGOs) such as the Lesotho Women's Institute, Lesotho Young Women's Christian Association, and Voice of the Voiceless and projects such as Women's Ambitions for a Better Future.

Religious and Cultural Roles

Roughly 80 percent of Lesotho's residents have converted to Christianity. Catholicism predominates and has a large influence on education throughout Lesotho, with approximately 75 percent of all primary and secondary schools being owned and managed by the Catholic Church. Some Basothos are Anglican and Dutch Reformed, while approximately 20 percent of the population uphold indigenous beliefs. There is also a very small presence of adherents to Islam and Hinduism.

Issues

Sexual Violence against Women

The most influential organization in addressing gender-based violence in Lesotho is Sexual Health and Rights Promotion (SHARP), which was established in 2012 by CARE International, the global confederation of 14 member organizations that work together to end poverty. SHARP regional resource and information centers throughout the country are staffed by peer educators who help raise awareness and encourage open discussion about sexual violence. Useful in their advocacy work was

the establishment of a clarifying definition provided by the World Health Organization (WHO) in 2002 that sexual violence is "any sexual act, attempt to obtain a sexual act, unwanted sexual comments or advances, or acts to traffic, or otherwise directed against a person's sexuality using coercion, by any person regardless of their relationship to the victim, in any setting, including but not limited to home and work." While useful, however, the reality for many Lesotho women is that they are disadvantaged by cultural and systemic structural practices that cause them to be especially vulnerable to violent acts, some of which include sex roles as defined by customary laws, and economic factors associated with the perpetuation of poverty (especially in rural areas). There are also the facts that women remain dependent on men, they have limited educational opportunities, and there is a lack of employment, among other issues.

Typically, most acts of violence against Basotho women go unreported, and in rape cases, for example, when women have spoken out, penalties and sentences for perpetrators are not severe, even though the law stipulates that rape is a capital offense. A report on *Sexual Violence in Lesotho* notes that, unfortunately, "legal factors, such as the status of women, legal definitions of rape, and laws regarding divorce, child custody, maintenance, and inheritance; and political factors including the underrepresentation of women in government" (Brown et al. 2006, 270) limit women's ability to overcome and fight back against gender-based violence.

Sexuality and LGBT Issues

According to a recent International Lesbian Gay Bisexual Trans and Intersex Association (IGLA) report titled *State-Sponsored Homophobia: A World Survey of Laws: Criminalisation, Protection and Recognition of Same-Sex Love* (Itaborahy and Zhu 2013), even though sodomy is prohibited as a common-law offense, "homosexual acts in Lesotho are legal, probably since the entry into force of the Penal Code Act on 9 March 2012." In the past, same-sex relations between females have never been outlawed in Lesotho, but with the legalization of same-sex relations between men, more concerted advocacy efforts have recently developed. Notably, the *BTI 2014: Lesotho Country Report* states that "gays and lesbians have formed a number of organizations to fight for their rights. However, it has been reported that many have been expelled from their homes after disclosing their sexual orientation to families" (BTI 2014).

Annually, the Global Equality Fund through the U.S. Department of State issues a *Human Rights Report* that catalogs the ongoing range of abuses and discriminatory treatment directed at LGBT community members worldwide. The section on “Sexual Orientation/Gender Identity References” indicates that homosexual conduct continues to be taboo in Lesotho (U.S. Department of State 2017). Consequently, societal abuses, discrimination, and acts of violence based on sexual orientation and gender identity are rarely openly discussed, and even though it is known that violence against LGBT happens frequently, there are many incidents that go unreported by victims for fear of ridicule and further abuses.

In general, there is limited information regarding LGBT issues in Lesotho; however, a handful of publications have contributed to an understanding of same-sex relationships in this country. In 1998, Kathryn Kendall produced her frequently cited essay “When a Woman Loves a Woman’ in Lesotho: Love, Sex and the (Western) Construction of Homophobia,” in which she indicates that some women-to-women relationships among Basothos are culturally specific and do not always reflect traditional homosexual relationships. Such relationships are discussed in Judith Gay’s “Mummies and Babies’ and Friends and Lovers in Lesotho,” which offers an examination of practices of institutionalized friendships among young girls and women who engage in close relationships known as “mummy-baby” that involve important aspects of sexual intimacy. As explained, “Mummy-baby relationships not only provide emotional support prior to marriage, but also a network of support for married and unmarried women in new towns or schools, either replacing or accompanying heterosexual bonds” (Gay 1986, 1).

While such relationships appear acceptable within a specific context in Lesotho, the situation for espoused lesbians and gays is less accommodating. Due to discriminatory practices, members of the LGBT community may be refused health care, and victimization by violence continues to go unreported because of stigmatization and fear. However slow progress in advocacy and acceptance of lesbians and gays in Lesotho may be, there is the uplifting reality that the country held its first Gay Pride March on May 18, 2013. It was organized by Matrix Support Group (MSG), a first of its kind Lesotho-based NGO that operates freely in 10 districts in its advocacy of the rights of lesbian, gay, bisexual, transgender, and intersex (LGBTI) individuals in the country. MSG’s philosophy is founded

on a gradual approach to sensitizing the public to LGBT issues, and they have been a helpful resource.

While LGBT acceptance and inclusion as yet falls short of the goal of full equity and acceptance, a hopeful outlook positions South Africa, on the whole, as what has been called “an exemplar of a multi-ethnic, multiracial African society seeking to include sexual minorities in its body politic” (Murphy 2000, 11).

Trafficking

Lesotho is a country of origin for internal and international human trafficking, which flows triangularly because of traffickers, trafficked victims, and the users of trafficked victims. A UNESCO policy paper, *Human Trafficking in Lesotho: Root Causes and Recommendations*, explains that poverty is the main cause of the prevalence of trafficking in this country (Nkiwane and Muso 2007, 12). In recent years, there has been a rise of this crime, with women and children being forced into sex and labor trafficking. Women are often subjected to domestic servitude, while men are forced into labor in South Africa. Main factors that perpetuate trafficking include lack of information and gender discrimination as well as “poverty, family break-up, violence or other dysfunction, lack of job opportunities, low education levels or the wrong skills for the jobs that are available, family pressures or a sense of responsibility to provide for the family” (Kane and Saghera 2001, 5).

Limited knowledge about and silence around this issue make it difficult for women to protect themselves from the supply-and-demand realities of trafficking as a sex industry and business enterprise. While many females are trafficked unwittingly, there are also those who willingly subject themselves to being trafficked to escape their impoverished lives. It is common for poor people to migrate over the South African border in search of work and allow themselves to be trafficked and for women to enter into prostitution, which makes them especially vulnerable to being trafficked.

Although the above cited UNESCO report offered insights and recommendations in 2007, a study conducted in 2010, titled *Rapid Assessment of Trafficking in Persons in Lesotho*, indicates that there continues to be a paucity of empirical data regarding trafficking in Lesotho, particularly regarding trafficking women for sexual purposes (Kropiwnicki 2010). In conducting this study, secondhand, anecdotal, and retrospective accounts were acquired from

key informants and respondents who knew about victims of trafficking for specified purposes. Information gathered included the following numbers of known trafficked persons: sexual exploitation (16 persons), farm labor exploitation (4 persons), construction labor exploitation (1 person), cattle-herding exploitation (1 person), organized crime exploitation (1 person), unknown purposes (3 persons), mine labor exploitation (0 persons), domestic work (0 persons), organ removal (0 persons), and adoption (0 persons).

Clearly, these limited numbers do not reflect the prevalence of trafficking in Lesotho, but however scant the actual numbers, what is certain is that girls and women are particularly vulnerable to the threat of trafficking—a threat heightened by the fact that they are left in the country alone while their men are working in South Africa. On a more positive note and despite the seriousness of trafficking in Lesotho, however, Index Mundi reports that, in general, the country at present

does not fully comply with the minimum standards for the elimination of trafficking; however, it is making significant efforts to do so; the government has decreased its anti-trafficking law enforcement and victim protection efforts during 2012; authorities have initiated fewer prosecutions, ceased arresting suspected trafficking offenders due to a backlog of prosecutions, and stopped referring victims to NGO centers for care; the government has not implemented key portions of the 2011 anti-trafficking act, including failing to develop formal referral procedures, establish victim care centers, and complete a national action plan. (2013)

To combat trafficking in Lesotho, it has been recommended that “legislative, political and economic measures must be undertaken at national, regional and international levels to eradicate human trafficking,” in addition to exposing, prosecuting, and punishing the perpetrators (Nkiwane and Muso 2007, 12).

Liberia

Overview of Country

The Republic of Liberia, Africa's oldest republic, was established in 1847 by freed American and Caribbean slaves who had begun settling in the territory in the early 1820s. The country is now composed of just over 4 million people (UNDP 2015) and encompasses a landmass similar in size to the state of Tennessee. Liberia is located in the northwestern region of Africa along the Atlantic Ocean. It is bordered by Sierra Leone, Guinea, and Côte d'Ivoire. The tropical climate consists of warm temperatures and high rainfall. Iron ore, gold, diamonds, rubber, and timber are among the country's natural resources.

Though exact numbers vary, Liberia is home to approximately 16 to 28 ethnic groups. A vast majority of the population practices Christianity (85%), followed by Islam (12%), and then traditional African religions (less than 1%). English is the official language, though there are

16–24 other regional languages spoken, many of which have no written form (UNDP 2015).

In 2013, the UN Development Programme (UNDP) ranked Liberia 145th out of 187 nations on the Gender Inequality Index (GII). The country was ranked even lower on the Human Development Index (HDI), in which it placed 175th out of 187 nations. Despite low rankings, Liberia's gains on the HDI shows promise, with a continuous increase of approximately 2 percent gains annually since 2000 and a 3-point climb between 2007 and 2012. The country has been recognized as 1 of 14 in achieving the highest gains in HDI (UNDP 2015).

History

Founded by the American Colonization Society (ACS)—a philanthropic organization that sought to create a colony for free African Americans—Liberia's name originates from the Latin word *liber*, or "free," and translates to "Land of the Free." The mission of the ACS was to decrease racial tensions that saturated the United States because of slavery and emancipation. The ACS consisted of African Americans, both free born and emancipated, as well as white Americans, both abolitionists and slave owners. Members from both sides of the political spectrum believed that African descendants would not assimilate into white America. As such, the ACS determined that the best course of action was to assist African Americans in immigrating to what later became known as the Republic of Liberia (1824).

The ACS was not an entirely benevolent society; many white Americans approached this initiative so that they would not have to live side by side with the increasing number of free African Americans. The ACS raised funds and lobbied Congress for financial support to ship self-selected African Americans and people of the Caribbean to Liberia. The population of African Americans in Liberia became known as Americo-Liberian settlers. These new settlers managed the economy until Liberia's independence from the ACS in 1847. Americo-Liberians and their descendants made up the country's elite despite comprising only a small number of the populace.

Liberia is one of only a few African countries not colonized by a European country (although it did lose land that was abundant with resources to nearby British and French territories). However, the creation of a republic by freed slaves does constitute colonization, and rocky relations ensued between ACS colonizers and the indigenous people who had lived in the region before, and during, the

establishment of the republic. Though unsuccessful at the time, indigenous groups tried to resist and overturn the new establishment. Like the history of the United States, Liberia did not acknowledge or represent its indigenous groups, and they were not granted unimpeded enfranchisement rights until the 1960s. Indigenous descendants overthrew Americo-Liberian rule in 1980.

Liberia has both actual and symbolic ties to the United States. For example, Liberia's Constitution was modeled after the U.S. Constitution and operates on three branches of administration: executive, legislative, and judiciary. Liberia's capital, Monrovia, was named after U.S. president James Monroe who garnered funds for the ACS initiative. Liberia's flag is similar to the U.S. flag, but with Liberia's one star representing its "lone star" status as an independent republic.

Liberia has a complex political history that has operated at the expense of women's involvement in politics, women's rights, and the advancement of women's education, to name a few issues. However, in recent history, there has been a radical political shift initiated by women. As the sections that follow detail, women were responsible for ending Liberia's second civil war (1999–2003), and they have since occupied many political positions—including that of the first female head of state on the continent of Africa. These initiatives and others have helped advance the security and well-being of women, children, and families in the country.

Education

Christian mission schools introduced Western ("formal") educational institutions to Liberia with the intention of converting youth and community members. Most adolescent girls growing up in Liberia today have not received a formal education. Illiteracy rates are higher for women (60%) than men (30%) ages 15–49 years, with 42 percent of Liberian women having never attended school compared to 18 percent of men (Empowering Women 2015). In rural areas, literacy and school attendance rates are even lower. However, legislation under President Ellen Johnson Sirleaf (1938–) has mandated free primary education, resulting in the quadrupling of student enrollment in schools. As such, a majority of the students in Liberian primary schools are girls. Still, successful efforts to enroll girls have not yet translated to maintaining their enrollment statuses. In rural areas, only 8 percent of women have completed secondary and postsecondary school, while for males, the

Women's Voices

Leymah Gbowee

Leymah Gbowee is a Liberian peace activist known for leading the Women of Liberia Mass Action for Peace, which helped bring an end to the Second Liberian Civil War in 2003. The film *Pray the Devil Back to Hell* (2008) documents the peace movement and the influence that it had on ending the civil war. In 2011, Gbowee was jointly awarded the Nobel Peace Prize along with Ellen Johnson Sirleaf and Tawakkol Karman. They were recognized "for their nonviolent struggle for the safety of women and for women's rights to full participation in peace-building work" (Nobelprize.org 2011). Gbowee is also the author of *Mighty Be Our Powers: How Sisterhood, Prayer and Sex Changed a Nation at War* (2011).

—Haley Cawthon

Nobelprize.org. 2011. "The Nobel Peace Prize for 2011." October 7. Retrieved from http://www.nobelprize.org/nobel_prizes/peace/laureates/2011/press.html.

number more than doubles to 19 percent, according to the United Nations (UNDP 2015).

Several barriers may contribute to impeded access to education and high attrition rates for female learners, including traditional initiation practices, child marriage, teen pregnancy, and a limited number of schools available to youth in certain areas. Sexual abuse by male teachers is also said to contribute to high attrition and extended absences of female students.

Bush schools prepare rural youth for traditional Liberian society. Located in the bush territories of Liberia, Sierra Leone, and Guinea, the schools are headed by spiritual leaders known as *zoes* and offer initiation into two secret societies, or schools: the Sande for girls and the Poro for boys. Educational foci include local history and genealogy, among other subjects. Additionally, the Sande prepares girls for marriage, home management, husband care, traditional elder greetings, and elder respect as well as religious teachings. Both female and male circumcision take place at bush schools, which grew even more controversial amid the Ebola outbreak. More on female genital mutilation and cutting can be found in the health section of this chapter.

Bush schools, which offer teachings varying in length from one month to one year, depending on location, are also controversial because they are said to impede girls' exposure, enrollment, and continuance of formal education. In fact, attendance at bush schools is correlated to increased dropout rates at formal educational institutions. Families are often pressured to enroll their children in bush schools in exchange for greater communal influence. Conversely, families who do not send their children to bush schools are often shunned. Enrollment at bush schools has no minimum age, though the average age is usually between 4 and 12 years, and many girls are often married upon graduation. Because some girls are sent to the bush as young as 2 or 3 years of age, Mama Tormah, the executive director for Culture and Female Affairs at the Ministry of Internal Affairs and the head of female zoes, argues that girls entering the bush should be at least 18–20 years of age—an age when she contends that girls can reason for themselves.

Girls: Educating Communities about Ebola

First reported in March 2014, the Ebola virus disease (EVD) ravaged through multiple countries and claimed thousands of lives in Liberia, Sierra Leone, and Guinea. Liberia was particularly hard hit, with the Centers for Disease Control and Prevention (CDC) reporting over 10,000 cases and nearly 5,000 deaths from EVD.

As of 2014, a group made up almost entirely of teenage girls was responsible for educating more than 4,000 citizens about EVD in Monrovia's impoverished West Point neighborhood. The teen group, originally organized by UNICEF in 2012, was formed prior to the Ebola outbreak as an outreach service to teach girls how to protect themselves from sexual violence. Two years later, the Ebola virus spread to Liberia. Some Liberians did not believe that the virus existed but feared that government corruption had led to the fabrication of the disease in an effort to gain international monetary support. Following some local protests at an Ebola center that resulted in the looting of medical supplies and increased exposure to the disease, the aforementioned teen group reorganized into Adolescents Leading an Intense Fight against Ebola (A-LIFE). With the closure of schools in the country's capital, the enthusiastic group, consisting of teens ranging in age from 16 to 19 years of age, educated citizens on the reality of the virus, including facts about symptoms and prevention. A-LIFE's methods for engagement included singing messages to

the masses, knocking on doors of private residences, and passing out pamphlets to community members. UNICEF has provided A-LIFE participants with protective gear and hand sanitizer. The group convened between two and seven times per week and was accompanied by a UNICEF staff member.

Health

Civil wars in 1989–1996 and 1999–2003 decimated Liberia's already tenuous health care system. The World Health Organization (WHO) reports that 242 of the 293 public health facilities were looted and destroyed in the fighting. The collapse and extirpation of infrastructure—also resulting from the wars—continues to impede access to health care facilities. Liberian women's access to health care varies dramatically by geographic region, as women living in urban areas have greater access to care than women living in rural locations. International and religious organizations supplement much of the country's health care services, though some clinics and hospitals require payment before service. Health care costs in cities are handled in multiple ways, ranging from free hospitals to those requiring nominal fees. The country's goals for achieving the status of a middle-income nation by 2030 require emphasis on increased positive social and health care outcomes. As such, the country is focusing on long-term goals, including recovery and reconstruction of health care centers as well as the provision of health services within five kilometers of a majority of the communities.

Goals also include an increase of human resources from 8,000 to 15,000 by 2021 (WHO 2014a). Obstacles to achievement include resource shortages of health care workers and financial backing. Liberia's Country Cooperation Strategy (CCS) 2013–2017 includes prioritizing the health of mothers and children. One approach for ensuring this success includes increasing community participation in health care interventions aimed at supporting child and maternal health through the ages. Further, the strategy seeks to work collaboratively with stakeholders in the “prevention and management of gender-based violence, sexual gender-based violence and promotion of women's health and development, and healthy ageing” (WHO 2014a).

Maternal Health and Infant Mortality

Lack of professional health care is a major concern in Liberia. Women who live in rural areas have to walk as many as

eight hours to reach a clinic. Liberia is noted as having the second-highest birth rate for girls aged 10–14 (UN Foundation 2015). Despite declining numbers, maternal mortality rates in the country rank among the highest in the world. Approximately four pregnant women or girls die a day, making the maternal mortality ratio 760 for 100,000 births (AllAfrica 2013). Liberia has successfully reduced its infant deaths by 5.4 percent annually, making it the most successful reduction in all of Africa. Infant deaths hover at 58 per 1,000 live births (UNICEF 2012). According to WHO, the neonatal mortality ratio is approximately 27 per 1,000 live births, and just over 46 percent of births are attended by a skilled health worker, though numbers vary between rural and urban locations (UNICEF 2014). In particular, high maternal mortality rates are linked to limited reproductive health services, poverty, and poor infrastructure resulting from the civil wars. Once a child is born, infectious diseases, poverty, and war radically inhibit life expectancy rates, which are reported as 63 years for women and 61 years for men as of 2013 (WHO 2015).

Female Genital Mutilation and Cutting

Female genital mutilation or cutting (FGM/FGC), or female circumcision, is the full or partial removal of or injury to female genitalia for nonmedical reasons. While the process originated to ensure the chastity and marriageability of girls, it has more recently corresponded to cultural or religious identity. However, according to the Office of Women's Health in the U.S. Department of Health and Human Services, FGM/FGC is not supported by any religious texts “and is condemned by many religious leaders. [Still, the] practice crosses religious barriers. Muslims, Christians, and Jews have been known to support FGC on their girls” (UNICEF 2012).

Female circumcision methods vary dramatically by region, as does medical involvement. For example, while FGC in Egypt is mostly conducted by medical personnel, in Liberia, the process is frequently performed by elder tribal women or priestesses who do not have medical training and do not provide anesthesia.

The process is referred to as “female circumcision” and “female genital mutilation.” The latter term has been used to draw attention to FGM as a human rights violation; yet, it has also been problematized for the judgment it conveys when addressing women who have endured circumcision. Similarly, campaigns headed by Western nongovernmental organizations (NGOs) have been criticized when the

NGOs send Westerners to non-Western countries for educating against female genital “mutilation.” This act creates a boundary between public health workers and the women they are trying to reach because the language insults the very bodies that workers are intending to involve in the campaign. There has been a shift to more sensitive language to engage and mobilize more diverse populations (i.e., both those who have and have not experienced cutting). Conversely, critics have noted that the term “circumcision” paints broad strokes of similarities between male and female circumcision that are erroneous and do not expose the detrimental physical and psychological impacts of the procedure on women and girls. The term “female genital cutting” has been widely used, as it does not conjure judgment, nor does it mislead. Some international groups have employed the term “female genital mutilation/cutting” (FGM/C) as a mindful compromise. Unfortunately, news agencies as well as major health, governmental, nongovernmental, and intergovernmental organizations continue to fall back on the term “female genital mutilation.”

UNICEF reports that 66 percent of girls ages 15–49 have undergone female circumcision in Liberia, categorizing the country as moderately high (2014). Furthermore, socioeconomic statuses play a role in FGM/FGC in Liberia: girls from the poorest households are twice as likely to undergo FGC as their wealthy counterparts (UNICEF 2015). Education is also an indicator of who undergoes female genital cutting; those more highly educated are less likely to experience cutting. Many female circumcisions in Liberia are performed in the Sande schools where girls are reportedly silenced about their experiences through tactics of intimidation and threats. More on Sande schools can be found in the section on education.

Some of the widespread structural problems with cutting include the lack of sterility found in physical environments where the procedure is performed as well as the often crude, unsterilized tools utilized for cutting. A pocket knife, shards of glass, scrap metal, and other found objects have been reported as tools for performing the operation worldwide. Immediate and long-term medical complications include death, infection, severe bleeding, complications in giving birth, perinatal death, infertility, increased risk of sexually transmitted infections and diseases, sexual health issues, trauma, and posttraumatic stress.

Worldwide campaigns to end FGC have shifted from educating about associated health risks, which has led to increased medicalization in some parts of the world, to making it a human rights violation. FGC “became classified

as a form of violence against women” in the 1993 Vienna World Conference on Human Rights, as it is argued that “FGM/C violates the right to health and bodily integrity” (UNICEF 2015).

HIV/AIDS

The first AIDS-related death in Liberia (1986) was that of a woman. The Liberian government acted quickly to prevent and control the spread of HIV/AIDS by establishing the National Aids and STI Control Programme. Though successful, the program’s progress was impeded by civil wars. Despite the prevalence of HIV/AIDS in sub-Saharan Africa, the western region of the continent experiences relatively low rates of the disease and is categorized as a “low-level generalized epidemic” by the World Health Organization (WHO 2014b).

Liberian women experience higher rates of HIV/AIDS diagnoses than men. Additionally, a greater discrepancy between diagnoses is found between urban and rural settings in Liberia, with the latter experiencing lower rates. For example, Monrovia, the capital of Liberia, sees rates between 2.5 percent and 3 percent, while rural reports hover at approximately 0.8 percent (UNDP 2012). WHO reports that the greatest comprehensive knowledge of HIV/AIDS is among single and never married young women and men. Despite such promise, women trail behind men, sometimes by 10 or more percentage points, in their comprehensive knowledge of HIV/AIDS. Additionally, females with multiple partners aged 15–24 are less likely to use condoms than their male counterparts, at 16.2 percent and 27.8 percent, respectively (UNDP 2013).

Physiologically speaking, women and girls are at greater risk for exposure to HIV/AIDS than men and boys. Another explanation for the prevalence of the disease in females is transactional sex in which transmission of the disease is between older men and younger women or girls. Economic devastation from civil wars positioned females in need of goods for survival for themselves and their families. Older men have more situated power and can dictate the terms of encounters, including a refusal to use condoms. Postwar transactional sex continues to be a prevalent dynamic due to women’s and girls’ lack of access to food, education, employment, and economic stability.

Despite the country’s immediate and progressive efforts to quell the disease, HIV/AIDS comes with a hefty stigma in Liberia, particularly for women and girls who are diagnosed. Following many years of civil war and unrest,

Liberia’s social service structures are weak, thus lending more power and influence to families and communities. While familial and community support can make rich contributions to the well-being of a society, the power contained in these entities, particularly when they operate from oppressive patriarchal perspectives, can yield harmful outcomes for women and girls. Many women resist telling their families when they are living with HIV/AIDS for fear of ostracization, retribution, and shaming. In doing so, numerous women are not able to receive proper medical treatment or to attend support groups for fear of being publicly identified as HIV/AIDS positive. Some women also experience increased domestic violence because their HIV/AIDS-positive status renders them less valuable. Alternatively, some women disclose their status and are ousted from their families and social networks. Their risks for job loss, unemployment, high-risk employment, and homelessness increase exponentially, which can consequently lead to increased risk of poverty, street violence, and exploitation.

Employment

Poverty is rife in Liberia. The World Bank estimates that, as of 2007, 64 percent of Liberians live below the poverty level (World Bank 2015), and many more live in deficit of their basic needs. Women in Liberia are responsible for a majority of the labor (54%); yet, 90 percent of their work is relegated to agriculture and informal sectors (“Empowering Women” 2015). Informal work can be defined as that which is not legally regulated or noncontractual and is frequently negligent of fair wages, humane work hours, and safe working conditions. Formally educated women from urban areas typically have access to more diverse job opportunities than their rural counterparts who lack a conventional education.

Many women engage in the informal sector due to their lack of education, a lack of opportunities, and proximity to home and kin as well as the dire need to support their families. Women who work in the informal sector frequently earn lower wages than their male counterparts and risk increased exploitation. Common jobs for women who are not conventionally educated include agricultural work, trading, fishing labor, and vending. Mining, an industry that earns more than the aforementioned professions, is predominantly occupied by men.

Women who are considered “educated” by Western standards (that is, they have completed compulsory and

higher education) have careers as doctors, government officials, corporate executives, administrators, educators, and advocates. The advances of women in Liberian society can be tied in part to the tireless efforts of President Ellen Johnson Sirleaf and several other women in governmental and nongovernmental areas of leadership. Yet, despite advances, patriarchal dominance continues to pervade many aspects of society, threatening women's advancement in the workplace and access to and progress in education and health care. Though many initiatives have been put into place to continue the promotion of women in multiple sectors of society, some are concerned that the 2017 elections could halt advances in gender parity, depending on the agenda of the incoming president.

Several factors in both distant and recent history have played roles in the economic disparity of Liberia. Some of these factors include patriarchal attitudes that have advanced the security of men over women and children, civil war, and political representation that has historically favored Americo-Liberians, the minority elite, over the security and advancement of indigenous groups. Moreover, the exodus of elite and educated members of society (known as "brain drain") during times of war further amplified the country's fiscal hardship. Liberia experienced one of the most severe economic downturns ever recorded when it lost 90 percent of its gross domestic product (GDP) between 1987 and 1995, a time period that overlaps with the country's first civil war, which waged between 1989 and 1996 (Boley 2011). The UNDP estimates that, as of 2014, more than 56 percent of Liberia's population lives below the poverty line. This number is likely to have increased as a result of the economic impact of the Ebola virus disease outbreak. In 2014, the per-capita annual income was USD\$700 (UNDP 2015).

Despite such calamities, peace has advanced economic security, and as of 2008, agriculture had rebounded to 61 percent of the GDP (Boley 2011). Despite such steady gains, it is important to note that the side effects of the Ebola virus disease have reportedly upset economic growth. At the time of this writing, assessments and evaluation are still being administered and determined.

The *Liberia: Country Strategy Paper 2013–2017* (CSP), as outlined by the African Development Bank Group, seeks to promote jobs in the energy and road development sectors to jump-start tributary markets such as agricultural production that will work to create gainful employment for women, aging people, and indigenous groups. Specifically,

CSP goals work to promote inclusion and green markets that will positively impact the climate.

Child Labor

While moderate advancements have been made as of 2013, child labor, particularly in mining, agricultural, and service industries, continues to be a problem in Liberia. The minimum legal age for work is 16 years for the agricultural sector and 18 years for the industrial sector. While it is legal for youth under age 16 to work, as long as it does not impede school attendance, there are no penalties for employers that violate the law. According to the U.S. Department of Labor, almost 17 percent of Liberian children aged 5–14 work (U.S. Department of Labor 2013).

While laws exist to prohibit child trafficking and sexual exploitation, threats to child safety still prevail, as many youth are trafficked between Liberia, Sierra Leone, Guinea, Nigeria, and Côte d'Ivoire. Work by trafficked youth often includes "domestic work, street vending, commercial sexual exploitation, farming, and begging" (U.S. Department of Labor 2013). In 2013, 34 youth were rescued from trafficking by the Liberian government, and at the time of this entry, only two suspected traffickers are pending trial.

Family Life

Marriage and Divorce

Despite recent political gains made by women, Liberia remains a patriarchal society. The dominance of patriarchy can be seen in varying degrees within both the family and society—particularly in legal and economic structures. Marriages are often arranged in Liberia, and the groom is expected to pay a bride-price to his future wife's family. While the legal ages for women and men to marry are 18 and 21, respectively, some girls are married as young as 12 because the bride-price benefits her family's financial security.

While Liberian law recognizes both (heterosexual, biological) parents as "joint natural guardians," in the case of parental separation, the father is awarded custody of any minor children unless he is unable to care for them or is deemed unfit by a court of law. In the event of death or absence of the father, the mother is entrusted with the custody of her children unless she is unable or deemed unfit.

Gay and Lesbian Rights

In 2011, controversy emerged around gay rights issues in Liberia. The country's constitution penalizes same-sex

encounters with up to one year in prison. However, anti-gay and antilebian sentiment increased when the United States sought to bolster Liberia's "protection of gay rights." Subsequent to this announcement, rumors had amassed that the United States would cease international aid to Liberia if the country did not change its constitution on same-sex marriage. This fueled antigay sentiment and increased the proposal of legislative bills that would create harsher laws, including 5- and 10-year sentences for engagement in sexual acts and gay marriage, respectively.

The incident sparked discourse on the influence and power of the United States and the West on Liberia. Such attempts to influence the country were rejected by many government officials and civilians alike. President Ellen Johnson Sirleaf summarized common oppositional response when she stated, "We've got certain traditional values in our society that we'd like to preserve" (NPR 2012).

Politics

Many laws have been put into place to advance the rights of women in Liberia. However, the lack of access to updated laws often impedes advancements and security for women and girls and thus maintains their status quo.

War

In December of 1989, Charles Taylor (1948–) led a rebellion to overthrow Liberia's authoritarian ruler, Samuel Doe (1951–1990). Doe was eventually publicly tortured and murdered by an offshoot of Taylor's rebel group. Taylor's actions led to civil wars in Liberia (1989–1996; 1999–2003) and his own presidency, which was allegedly won under severe voter intimidation. Many human rights violations persisted, and more than 15,000 child soldiers fought in the wars. Taylor's political interferences and employment of massive violence were not limited to Liberia.

Throughout history, sexual and gender-based violence (SGBV), such as rape and the murder of women and girls, have been employed as tools of aggression to situate oppositional power and devastate communities. Lingering effects of war include severe and continued damage of the country's economy, a loss of foreign investors, brain drain, community violence, violence against women and girls, and the degradation of social services, health care, and education. For women and girls in lands of conflict, war frequently does not end when the fighting ceases. In Liberia, rape continues to be one of the most reported crimes,

with a gross majority of its victims under the age of 18 (Boley 2013).

Ramifications from war have also correlated with other increases in instability for women and girls. Such disequilibrium can lead to exploitive labor, sex work, or child marriage in exchange for a bride-price to the family. Furthermore, with the death or disappearance of men in combat, widows may be faced with caring for their families alone; they may have fewer opportunities for earning a dependable income, and children may be more vulnerable when mothers leave the home for work or other parental duties. In short, while war devastates people, communities, and environments, women, girls, and children are especially vulnerable, and they tend to suffer consequences long beyond the conclusion of battle.

Just following the second civil war in Liberia, the UN Mission in Liberia (UNMIL) deployed peacekeepers and international police to assist in the postconflict peace process. At that time, the Disarmament, Demobilization, Rehabilitation and Reintegration Program (DDRR) was initiated. The DDRR is a measure employed in some postconflict territories as a means for securing peace, stability, and relief. The process demobilizes combatants and connects them with rehabilitation initiatives that include education and skills training for reintegration into society. The initiative also serves armed civilians in Liberia. "According to Amnesty International, 73 percent of women over 18 who registered for DDRR reported some kind of sexual abuse. During the year, NGOs working in IDP camps reported incidents of rape, including the rape of children" (U.S. Department of State 2005).

Women End the Civil War

Women are credited with ending Liberia's second civil war (1999–2003) via multiple organized efforts, such as the Women of Liberia Mass Action for Peace (WLMAP). The campaign was initiated by social worker Leymah Gbowee (1972–) and began as a group of Christian women praying for peace. Efforts soon expanded to collaborate with Muslim women per the advocacy of Asatu Bah Kenneth, an activist who served with the Liberia National Police for more than two decades. Clad in all white, WLMAP initially demonstrated for one week at a fish market in Monrovia during the spring of 2003. This was a strategic location within sight of then Liberian president Charles Taylor's residence. Starting out with a few hundred women, the WLMAP initiative amassed more than 2,500 by week's

end. Other efforts for obtaining peace included sit-ins, radio addresses, marches, vigils, singing, dancing, and a sex strike. Liberian women withheld intimacy believing that doing so would prompt men, the perpetrators of the violence, to pray for peace and an end to the war.

After many efforts, the WLMAP successfully commanded peace talks between Taylor and various opposing rebel groups. Talks took place in June of 2003 in Ghana, and while significant, they were not conclusive of peace, as war broke out in Monrovia. The efforts that followed included talks in Sierra Leone between WLMAP constituents and opposing rebel groups, Liberians United for Reconciliation and Democracy (LURD) and Movement for Democracy in Liberia (MODEL); peace talks in Ghana between opposing rebel factions; and Taylor's indictment of war crimes in Sierra Leone. Despite fleeing back to Liberia to avoid arrest, Taylor resigned within weeks, and by summer's end, international peacekeeping troops had entered Liberia. This was followed by a disarmament initiative in December of that year, in which former soldiers were offered cash for weapons.

First Female President

Democratic elections followed war, and in 2005, Liberia elected Africa's first female head of state, Ellen Johnson Sirleaf, an economist. Johnson Sirleaf earned her presidential position over a popular male soccer star. The election of a woman to office signified a notable shift in political power as Liberian citizens questioned the values and use of power by male politicians. Johnson Sirleaf, Leymah Gbowee, and Tawakkol Karman would be corecipients of the Nobel Peace Prize in 2011 "for their non-violent struggle for the safety of women and for women's rights to full participation in peace-building network" (NobelPrize.org 2011).

Some postconflict initiatives drawn up by Johnson Sirleaf's administration reveal the government's "commitment to achieving gender equality and women's rights as a means to maintaining peace, reducing poverty, enhancing justice, and promoting sustainable development" ("Empowering Women" 2015). The National Gender Policy works to promote gender equity by creating systemic supports that ensure equal access to both control and benefit from the country's resources. The National Action Plan on Implementation of UN Security Council Resolution 1325 "highlights the agency of women and mandates governments to ensure their inclusion in all processes affecting

their peace and security" (Government of Liberia 2013). The government of Liberia and the United Nations are working collaboratively through joint programs to ensure the advancement of six interventions: food security and nutrition, sexual gender-based violence, gender equality and women's economic empowerment, youth empowerment and employment, county support teams, and HIV/AIDS. The joint programs are said to honor the priorities outlined at the National [Liberian] Women's Conference held in Monrovia in May of 2008. These initiatives can be attributed to the legacy of Liberian women's work during wartime to ensure peace.

Regarding contemporary politics, Liberia is a unique country that has both advanced women's visibility and credibility in public service and maintained a strong hold on patriarchal values that threaten the progress of women serving in public office. Under the appointment of President Johnson Sirleaf, women have occupied significant seats as county superintendents, county capital mayors, and cabinet members. The advancement of women in elected positions has been slower. As of 2014, less than 13 percent of women made up the legislature. The next Liberian presidential election is in 2017. This will be a significant election with outcomes that can optimize, slow, or negate the work done to advance the rights of women and girls.

Religious and Cultural Roles

Religion

There are up to 28 ethnic groups in Liberia. As such, religious beliefs and practices are abundant and diverse. While there is no official religion in the country, Christianity is the most practiced and is commonly seen in societal proceedings, such as governmental events in the capital. Because Christianity was introduced by the Americo-Liberians, it has Protestant leanings. Several other denominations are practiced as well. Furthermore, many Christian practices are also combined with indigenous religions.

Culture

Artistically speaking, Liberia is known for its carved masks, dance performances, and storytelling. While the masks are traditionally carved by men, the Sande society is the only known female group to utilize masks during their performances. Furthermore, the Sande is a great patron of

the arts; hundreds of their masks are located in museum collections.

Regarding international influence on the arts, freed slaves who settled in Liberia brought with them many artistic and cultural traditions both specific to the Southern United States as well as traditions culled from slave culture. For example, the Southern craft of embroidery and quilting blended with that of indigenous African art in the Liberian region, making embroidery and quilting part of the new culture. Needle arts are highly popular in contemporary Liberia, and the country hosts many fairs to highlight such works. Similarly, slave hymns and indigenous African music have amalgamated, adding another element to the song and music traditions of the region.

Issues

Domestic Violence and Legal Rights

Effective legislation needs effective reporting mechanisms that will protect its victims. While more laws are being written to advance the safety and status of women, they are rarely enforced, and conviction rates remain low. Many women do not report such abuses as domestic violence and spousal rape for fear of retribution, shaming, and humiliation. Thus, many crimes remain unreported by women as a means of protection for themselves and their children.

There are two sects of law to consider regarding marital rape and female circumcision in Liberia. As of 2014, criminal law clearly forbids marital rape and female circumcision on children, while civil law ambiguously states that 'bodily harm' is unlawful (Kvinna till Kvinna Slakthusplan 2013). The latter leaves too much to interpretation in court systems that may favor men. A woman who chooses to prosecute her perpetrating husband may do so by way of criminal or civil law, but, realistically, her options may be limited. Women (and their children) who depend on their husbands for financial security may not want their husbands to go to jail due to the loss of income, and some women may not feel safe prosecuting their husbands under criminal law for fear of retribution. Further, pressure from local communities may inhibit such pursuits, leaving civil law as the only viable option for prosecution. Civil law is often the compromise when families must remain intact. In such cases, the court attempts to create solutions, but, again, solutions may vary greatly from case to case because of the ambiguousness of laws and the predominance of male judges who might hold implicit or explicit biases against women.

Ebola Virus Disease

In March of 2014, the Ebola virus was discovered in Guinea and quickly made its way to Liberia and Sierra Leone and to other countries, though to a lesser degree. The virus has had a profound impact by claiming the lives of over 11,000 women, children, and men. While Sierra Leone had the most reported cases of Ebola, Liberia experienced the highest number of deaths during the pandemic, partly due to having few medical resources and the difficulty of dispersing accurate information to citizens. In 2014, UNICEF reported that women comprised 75 percent of Ebola infections in West Africa (UNICEF 2014). Women and girls are disproportionately affected by the virus because of their prevalence in the nursing field as well as cultural expectations of care that predominately rely on women and girls. Women and girls in Liberia are often responsible for delivering babies, caring for ill family and community members, and preparing bodies for burials. Therefore, they are at increased risk for exposure to the deadly virus, which is spread through bodily fluids.

Other inadvertent effects of Ebola on women include turning away pregnant and nonpregnant women at health care facilities in an effort to prevent spread of the disease. Women have reportedly died from noncontroversial medical issues that would have otherwise been treated.

Two organizations that have been credited with addressing the roles of women and girls in the fight against Ebola include Let Girls Lead (LGL) and the Young Women's Christian Association (YWCA). Both organizations worked to provide personal protective equipment to volunteers while also dispersing information specifically to women and girls to raise community awareness and prevent spread of the disease. One of the goals of prevention included informing communities to turn care over to health care workers to diminish exposure.

The Ebola epidemic has thwarted recent gains in Liberia's postwar economic security. Development has slowed due to worker and familial illness, job loss, the implementation of curfews, and the quarantine of neighborhoods in an effort to contain the spread of the virus. GDP, employment, household incomes, food security, and health care productivity have decreased since the outbreak, while food prices, food scarcity, poverty, and job loss have increased. Additionally, foreign and domestic investors have withdrawn or delayed support, which has further interrupted small but important advances in the country's economy. Financial drought often affects peacekeeping efforts when

poverty increases and the security and safety of citizens diminish. In response to the Ebola crisis, the 2003 UN Mission in Liberia (UNMIL) that was established to assist with postwar security extended its initial troop drawdown date from 2014 until 2015.

As of 2017, transmission of the Ebola virus disease had been declared over by WHO, though the country is still under intensive surveillance.

Libya

Overview of Country

Libya is a country in the North Africa Maghreb that has borders with Algeria and Tunisia to the west; Sudan, Chad, and Niger to the south; Egypt to the east; and the

Mediterranean Sea to the north. With a relatively small population of 6 million people inhabiting the fourth-largest country in Africa, Libya's large petroleum reserves allowed this former Italian colony to quickly transform an underdeveloped society to reach a midlevel position in the UN Development Programme's Human Development Index (HDI). Its current position is 55th with an HDI of 0.784. It is also 55th in the more specific Gender Inequality Index (GII), which scores it at 0.215.

Despite these significant gains in legislative, health care, and educational equality, achieved under the quirky rule of Colonel Muammar Qaddafi (1942–2011), who took initial power in 1969 and consolidated his revolutionary program in the 1970s, women continue to experience serious challenges and inequalities in the workplace and society because of persisting patriarchal norms.

Seventy-eight percent of Libya's population live in major towns and cities (World Bank 2015). The two key cities are Tripoli, the capital, in the west and Benghazi in the east. A range of demographic, economic, and political pressures led to a revolution and the downfall of Qaddafi in 2011. Despite efforts at a transitional government in 2012, the country descended into civil war in 2014, with two governments claiming sovereignty.

Girls and Teens

Literacy

The literacy rate for girls was 99.9 percent on average in 2011 (UNESCO 2013). Libya has been a young country. In 1996, half of the population was under 15 years of age. In 2012, adolescents aged 10–19 accounted for 17.9 percent of the population (UNICEF 2017).

Extracurricular and Family Roles

Traditionally, girls have had few extracurricular opportunities. Young girls cared for the infants in their mothers' houses and prepared themselves for marriage. In the remote Arabized Berber village of Augila, an ethnologist's report in 1975 noted that teenage girls "may leisurely stroll beyond the confines of the village to gather bundles of twigs[,] . . . but as soon as an adult male comes upon the scene they cease their singing and pranking and quicken their pace" (Mason 1975, 651). This paints a relatively common picture of life in traditional rural society, though urban and upper-class girls would have had different experiences.

After reforms by the Qaddafi regime in 1984, school-girls were forced to participate in military training sessions, leading many Libyan families to refuse to send their daughters to school. Qaddafi placed a great deal of focus on young people, seeking to shape their opinions to circumvent opposition from the established Libyan political and cultural mores. There are anecdotes of young school-girls who were noticed by the colonel and "encouraged" to become volunteers in his revolutionary committees and guards. After the 2011 civil war, allegations emerged of sexual abuse and brainwashing of such volunteers.

In modern Libyan society, girls' activities are generally restricted to relations with those of their own gender, though some of the urban higher class enjoys Western habits, such as café culture. Teenage pregnancy is very low by African standards. In the maelstrom of the postrevolution civil war, sexual relations have emerged as a key dividing fault line. For instance, Grand Mufti Sadiq Al-Gheriani called for the segregation of the sexes in schools in 2013.

Sports and Recreation

Women are generally discouraged from taking part in sports, though there are a few sports clubs for women in central Tripoli.

Education

In traditional Tuareg societies, women had a grasp of the Tiffinagh Berber script. However, the rest of the Libyan female populace was generally discouraged from pursuing an education. This situation persisted during the Italian colonization period (1911–1952) and to some extent during the Senussi kingdom (1953–1969). Education became compulsory in the 1970s. Current enrollment numbers are difficult to find because of the recent turmoil in the country. Fewer children attend due to the violence and the unstable infrastructure.

Primary Education

The Qaddafi reforms incurred undeniable improvements for girls' primary education. UNESCO statistics for 1990 found that, uniquely among Muslim countries, enrollment figures in primary education were near equal for boys and girls. Ninety-one percent of girls were enrolled for primary school in 2006. In contemporary Libya, preschool entrance begins at age 4 with graduation at the end of two years. Children are enrolled in primary school from ages 6–11.

Secondary Education

In 1975, Libya's women were first in the North Africa region to attend school. Between 2006 and 2012, the United Nations calculated that slightly more girls than boys were enrolled in primary and secondary schools. Secondary school lasts from ages 12–17. Despite the Qaddafi revolutionary rhetoric, the new regime was contradictory, instituting censorship of books deemed contrary to Islam and introducing compulsory Koranic instruction at school. Nevertheless, the UN's *Human Development Report 2000* noted that female secondary school participation was quasi equal to that of males, unlike other Middle East and North African countries. Girls report feeling under greater pressure to veil in the postrevolution period, according to women's rights activist Aicha Almagrabi. The ever-vocal grand mufti of Tripoli, Al-Ghariani, encouraged the veiling of women teachers if boys in their classes had reached puberty.

Postsecondary Education

In 1958, Fawzia Gharur was the first woman to graduate from university. One report found that there has been a great increase in women enrolled in higher education, from 87,752 in 2004–2005 to 101,537 in 2007–2008. In contrast, there was a drop in enrolled men, from 62,419 in 2004–2005 to 59,179 in 2007–2008 (Pargeter 2010, 16). Children born to a Libyan mother but a foreign father were not eligible to benefit from the right to free education at the tertiary level, though this law was revised in 2010 to allow for some exceptions. Libya is nevertheless noteworthy for having successfully instituted subsidized tertiary education for its citizens.

Training and Continuing Education

A unique feature of Libyan women's education was the Women's Military Academy. Founded in 1978, it had trained more than 7,000 women by 1986 in how to “fire Russian-made surface-to-air missiles [and] dismantle and reassemble Kalashnikov rifles” (Miller 1986). In the postrevolution environment, a reluctance to train women police officers has emerged, partly because of suspicions that Qaddafi used his “guards” for sexual favors.

Health

Access to Health Care

In the aftermath of the Arab Spring and civil warfare, Libya was judged by the World Health Organization (WHO) to

have “extremely bad water and sanitation . . . in the main cities” (WHO 2015, 12). Furthermore, WHO also judged the crisis to have led to the destruction of public health care facilities, overburdened hospitals, few functioning health care personnel, and supplies running out for communicable diseases and regular issues such as diabetes (WHO 2015).

Female Circumcision

Female genital cutting (FGC), sometimes referred to as female genital mutilation (FGM), is rarely practiced in Libya, with limited cases reported among Bedouin or migrant sub-Saharan African communities. There is no law prohibiting it, probably in reflection of its rarity. Libya was nevertheless one of only three African countries to ratify the Maputo Protocol of the African Union (AU) in 2003, which proposes sanctions to discourage FGM.

Contraception and Fertility

Some form of contraception was used by 41.9 percent of women in 2007, a slight reduction from 45.2 percent in 1995 (World Bank 2016). Abortion is taboo and illegal unless the pregnancy threatens the mother's life (Pargeter 2012, 23). The penal code continues to criminalize those undertaking an abortion, with a six-month sentence as a minimum. The sentence is reduced if the abortion occurred to “preserve the honor” of a man.

Maternal Health

Nearly 100 percent of women receive delivery care with a skilled attendant. In 2013, the maternal mortality ratio was 15 per 100,000 live births, a steady increase in outcome (WHO 2015).

Diseases and Disorders

HIV/AIDS rates were unavailable in the latest WHO and UN statistics, although the “Bulgarian Nurses Affair,” during which several medics were charged with intentionally infecting hundreds of children with AIDS, raised the profile of the disease in Libya. A 2012 study by the Liverpool School of Tropical Medicine found 87 percent of drug users, 15.7 percent of female sex workers, and 3.5 percent of males in same-sex relations have contracted HIV (UNODC 2012). In 2003, Qaddafi

made worldwide headlines for claiming that HIV/AIDS could not be transmitted by heterosexual activity. Libya nevertheless made good progress against nonsexually transmitted diseases. Most children receive full immunizations; measles vaccinations reached 98 percent in 2007 (WHO 2015).

Employment

Typical Jobs and Careers

A *London Times* article from the mid-19th century outlined some of the work its correspondent witnessed being done by women in Ghadames, the northwestern Libyan oasis town, and Tripoli. In the Ghadames watering holes, “women and female slaves . . . fetch water night and morning. . . . There are no native manufactures in this city, unless the women’s weaving woolen baracans and burnouses, and jubbahs, be designated native” (*London Times* 1845). A later account from the 1950s relates how the servants typically lived on the ground floor, the women on the top floor, and the men in between. Slaves were often European or West African women, captured by Barbary corsairs or traded from the south.

Such household slaves, and women in general, used their time in the household to craft the abayas and burnouses that were sold in the Western regions of the country, while the rarer kilim and marqum rugs, a specialty of Misrata, were renowned and sold all over the Middle East. After colonization, some Italians were left behind, including one farm owner who employed Arab and Fezzanese women to work on his farm. In urban life, domesticity was not exclusive to Islamic communities. Among the Jewish community in Tripoli, leaving your wife at home was a sign of commercial success, though some of the less well-off merchants were forced to travel frequently to secure their goods, leaving their wives with the job of peddling the existing stock on the street and in households.

Seven years after independence from Italy, in 1952, there were still no women in government or public office, no female doctors, and only a few female teachers, though the independent country had instituted a system of teacher training. The Qaddafi reforms did have a clear impact in opening some avenues of work to women. A few women even became airline pilots, and a few were included in the diplomatic delegation.

The Qaddafi regime nevertheless introduced quirky curbs on women’s roles, for instance, by closing down

hair salons in the early years. Today, despite the upheaval in the country, women make up 35 percent of the labor force, which is comparable to other midlevel nations in the region (World Bank 2015). Women do not work in some occupations, such as taxi driving, construction work, or as mechanics. On the other hand, food and decoration are largely a female preserve. Elderly urban women and rural women sell their intricate food covers for the popular *bazin* dish. A great deal of women’s working time also remains in the domestic sphere, preparing food and taking care of children.

By 2013, many more women were practicing law. Yet, it is interesting to note that a division of labor seems to have emerged among the lawyers; women are more likely to work on family cases, while men work the criminal cases. The institution of “people’s” lawyers was a Qaddafi project that has led to an interesting debate within the Libyan legal profession. One account quotes a female Libyan judge as defending the institution, despite its connotations with the Qaddafi regime, because it protects women and the poor through legal aid. The same account described the family court, presided by a female judge and with the overwhelming majority of lawyers and litigants being women, as a female space.

Discrimination and Income Disparity

The Qaddafi revolution did bring in new legislation that sought to ensure equal pay for women. A survey done in 2002 nevertheless found that “about two-thirds of the wage differential between [Libyan] men and women is due to discrimination. . . . This level is too high and implies that the existence of legislation is not enough” (Arabsheibani and Manfor 2002, 1016).

Labor Regulations and Working Conditions

The Qaddafi era saw the institution of the right to maternity leave. Qaddafi also signed Libya up to the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) in 1989. However, the regime maintained reservations about Articles 2 and 16, which pertain to inheritance, marriage, and divorce. There is generally a lack of day care and maternal responsibility infrastructure in Libyan workplaces. However, women are exempted from night shifts and heavy physical work. Libya is a signatory to various International Labor Organization (ILO) agreements protecting women.

Family Life

Marriage

In traditional rural society, such as in Augila, a married couple had little choice of a spouse beyond approving or refusing. The mothers had the key role in matchmaking. During the wedding ritual itself, the two sexes were kept separate for two separate preparations. The wedding included events that demonstrated the women's particular sexual role, including the groom testing and taking the bride's virginity, a morning tea party where the groom was alone amid all the women, and men and women dancing in each other's fashion as a mockery of one another's roles.

Urban traditional society also offered little freedom of choice for women. Among the Jewish community in Tripoli, there was a regular feature where, on the last day of Passover, the girls dressed up and waited for young men who would then indicate to their parents who they wanted to marry. Parents then negotiated a marriage, with the older generation knowing more about the proposed partners than the brides and grooms themselves.

Currently, the age of marital consent is 20 for both sexes. Child marriages are now rare in Libya, though the law is reportedly widely flouted in rural areas, thanks to fake birth certificates. Law 10/1984 states that a husband has the right to his wife's "concern with his comfort and his psychological and sensory repose" (Cotto, Carlisle, and Ibrahim 2013, 108). Article 18 of Law 10/1984 states that the wife is responsible for the "supervision of the conjugal house and organization and maintenance of its affairs." The wife was entitled by Article 17 of Law 10/1984 to financial support from her husband, control over her own wealth and the right to be free from mental or physical violence.

Court permission is required for anyone wishing to marry before the legal age, and a guardian (such as a parent) can neither force a young person to marry a particular person nor stop them from marrying someone of their own choice. Though care is taken by family courts to make sure that the young persons are freely choosing to marry, economic vulnerability, including refugee status, contributes to assents for the good of an individual or larger family.

The president of the National Liberation Council (NTC) indicated a reinstating of polygamy in his first speech after the downfall of Qaddafi. Nevertheless, women's activists drafted demands for amendments to the draft postrevolution constitution in 2015 that included specific injunctions against forced and early marriage.

Household Roles and Responsibilities

In a village community like Augila, the traditional order emphasized that each woman and girl had a specific role within the domestic sphere. Women largely stayed in the household, with some of them picking vegetables in the communally held gardens. Young girls took care of infants, and teenagers went out for firewood. Modern, especially urban, Libyan women may have gained employment and education opportunities, but the domestic roles are still performed by women. Cleaning, cooking, and child-rearing are all shunned by Libyan men in general.

Divorce

Traditionally, men were generally favored in cases of marital breakdown, as shown in the case of one male who went through five marriages with no children simply to disprove suspicions that he was infertile. The grounds for separation were adultery, false virginity, and, more commonly, infertility.

In his first decade in power, Qaddafi's government passed Law 172/1972 on "protecting some rights of women in marriage, divorce for prejudice and consensual divorce," which was judged to be a case of an increasing trend toward implementing sharia into Libyan law and the beginning of the end of the separation between sharia common law and less religiously influenced personal status law. The law did provide new protections, such as requiring women and men to reach maturity, at 16 and 18 years of age, respectively, before being able to marry. Yet, the law did not fully remove polygamy: it placed limits on foreigners marrying second wives if their first was foreign. Qaddafi spoke out vociferously against polygamy, even though it was not a common practice.

A further law on marriage and divorce in 1984 placed a strict requirement of judicial approval for any polygamous marriage. Article 36 of Law 10/1984 made provision for the wife to object to her husband's attempt at divorce. The court can appoint arbiters, ideally two men "of upright character" from each side of the married families. They would have one month to reconcile the couple, and this failing, the judge rules on whether the divorce proceedings should go ahead. Law 10/1984 also made legal provision for housing for divorced women.

There are three means for getting a divorce. The first is repudiation by the husband, which will require him to pay his wife's unpaid dower (*mahr*). A second route is negotiation, or *khul'*, whereby the two parties agree on a

financial arrangement. Finally, there is the possibility of a judicial divorce, which can only occur if one of the couple claims to have been harmed by the spouse. A wife can also ask for this divorce if the husband fails to financially maintain her, is absent from the household, is sick, or is impotent. In this case, the responsible party for the divorce bears the financial consequences. Other laws in 1991 and 1994 placed further controls on consent from the initial spouse. In 1998, Qaddafi's moves toward greater regulation of polygamy faced opposition when the General People's Congress passed a law removing the consent from the first wife. However, this was soon struck down by Qaddafi.

The judge in the family also hears issues pertaining to child custody and financial maintenance. One account found Libyan family court judges to agree that postmarital child maintenance was the biggest cause of problems in sharia courts. If the father is a state employee, the child maintenance can be directly deducted from his pay. The average awards hover around 100 to 150 Libyan dinars a month per child. Legally, women are also entitled to housing in which to raise their children, which should be provided or rented by the husband.

In practice, many women are bullied or threatened into reaching compromises. Another caveat was the restriction placed on a woman if she remarried, which could lead to her losing custody over children from her first marriage. Other accounts are less sympathetic of Qaddafi's changes for women's rights, noting that after his 1969 coup, women no longer had the right to initiate the divorce.

Inheritance

Traditionally, the Sunni law of a woman receiving one-half of the brother's share was followed in theory. In practice, women rarely inherited any of the landed property. This Sunni tradition was formalized in Libyan common law and personal statute that drew its source from Islamic law. With respect to the inheritance of national citizenship, women cannot transfer citizenship to their offspring, although Law 20/2010 granted specific circumstances for the transferring of citizenship by women.

Gender Roles and Family Structure

The importance of Libya's tribal demographics cannot be understated. Women have less status than men in the tribal hierarchies. It should be noted that women are excluded from paying into the tribal fund that is kept for

emergencies, though they are eligible to benefit from it. In his *Green Book*, Qaddafi expressed attitudes favorable to gender equality, though he also outlined biological differences between the sexes. Thus, he believed that although men and women were fundamentally equal in terms of rights, there is no absolute equality between them in regard to duties. The early attempts by Qaddafi to institute revolutionary change among women were admitted even by his admirers to have encouraged only slow change as a result of the resilience of the traditional family and tribal structure.

Thus, Libyan society in the early Qaddafi period remained marked by a triadic of urban, rural, and nomadic women. Traditionally, urban women had depended on Islamic laws and family-arranged marriages for their welfare and progress. Rural women had an increased degree of choice in courting their partners and were more involved in household and agricultural work. Nomadic women were the most independent, spending much of their time outside of the domestic sphere. Tuareg women are generally far more powerful than the norm as a result of matrilineally passed kinship ties. Instead of authority passing down from a chief's father to his son, in Tuareg society, the eldest son of the chief's eldest sister is the heir. This obviously demonstrates the limits to women's authority even though it can be perceived as a powerful role. The independence of the Tuareg women was documented by Ibn Battuta in his 19th-century travel accounts.

The Qaddafi reforms essentially had the impact of improving urban women's lot by introducing educational and employment opportunities as well as some degree of legislative protection while largely passing over the rural and nomadic women. Indeed, the increase in rural-urban migration had led to greater numbers of rural women becoming suburban wage laborers, while the government's sedentarization programs had forced nomadic women to lose their previously autonomous positions. A new pressure on the family structure has been the proliferation of new media, such as satellite television and radio. Libya's post-Qaddafi political debates have suggested a repealing of adherence to CEDAW because it is undermining the family structure.

Sexuality and LGBT

Libya's Penal Code states that young women who contravene "moral codes" or who were "prone to engage in immoral conduct" could be detained indefinitely in

centers for social rehabilitation. Article 375 of the code counted extramarital sexual relations as a mitigating circumstance if a man was found to have killed one of his relations or his spouse. In 2006, a Human Rights Watch (HRW) report denounced these centers, claiming that women and girls were being subjected to virginity tests. The report also found that Libyan justice was defining rape as an assault on the honor of a woman, rather than a criminal act against the person.

LGBT communities have no rights in Libya and are actively discriminated against by both the government and social mores. The penal code made any sexual activity deviating from the Islamic norm, such as male-on-male sexual acts or gender transformations, illegal and punishable by a maximum of the death penalty. In 1994, Qaddafi passed sexual purification laws that included the punishment of flogging for adultery and death for homosexuality. In 2012, a delegate of the postrevolution National Transitional Congress made comments condemning homosexuals as a threat to the human race at the United Nations.

Politics

Rights and Political Struggle

Well before the Qaddafi period, various Libyan women had struggled to establish basic rights, such as women's education and suffrage. The first generation, led by such women as Hamida al-Inizi, Salha al Madnai, Khadija Abdulqadir, and Khadija al Jahmi, fought for the education of women while under the shadow of the Italian colonial state. The 1969 coup by Qaddafi introduced a degree of uncertainty with respect to gender equality. A constitutional proclamation and the *Great Green Charter* declared men and women to be equal, but the informal *Green Book* sought to mix in Islamic notions that the genders could not be completely equal. Qaddafi signed Libya on to the African Charter on Human and Peoples' Rights, which requires its parties to fully include women in political realms.

Many women took an active part in the 2011 protests by filming atrocities while taking care of the children and wounded and cooking for the young fighting men. The postrevolution Law 71/2012 placed a punishment of the death penalty on anyone creating or participating in an unauthorized political party or association. Despite such setbacks, Libyan women have keenly exercised their newfound right to vote. "Six hundred and forty-seven brave women registered as candidates, more than 687,000 voted, and thousands of women participated as campaign

volunteers, polling station workers, and domestic election observers," and 33 women were elected (Doherty 2013).

Part of the electoral law allowed for 32 seats to be reserved for women, though this was out of 200 in the postrevolution General National Congress (GNC). Despite these limits, women's groups lobbied the GNC to include women in a general commission tasked with constitutional, legal, and political reforms. Despite heavy lobbying, only 6 seats were allocated to women. Some groups are calling for sharia law, which would roll back many of the gains of the past century. The GNC adopted a constitution in September 2014 that established basic human rights. However, it dropped references to sexual discrimination in Article 6 in its final form.

Armed Forces

Despite stiff opposition, Qaddafi allowed women to take part in the army on an equal basis and called for "Arab women to participate in life and politics, in war and peace" (Sammut 1994, 200).

Land and Property Rights

The Qaddafi government introduced Law 4/1978, which allowed tenants to claim property for themselves through a process of land and property reallocation. Article 1 of the law stated that every citizen had the right to own a house or land. Article 2 forced anyone with multiple houses or plots of land to choose what land to retain, while Article 3 transferred all excess properties, except those used for business purposes, to the state. Article 7 set the parameters for redistribution while retaining the right of the state to keep land in the public interest.

Though the law did allow for compensation of expropriated landowners, most did not receive any. One account discusses a case where a property owner lost the upstairs flat in her house to the tenant as a result of the law. When the owner asked the tenant to leave, the latter refused, safe in the knowledge that her proregime stance protected her. The UN High Commissioner for Refugees has estimated that three-quarters of Tripoli's people may be living in expropriated property. A women's association of property claimants was established postrevolution in Tripoli. Women also participate in the largest association aimed at regaining property expropriated by the Qaddafi regime, the Association of the Owners Harmed by the Ruling of the Tyrant.

Judicial System and Personal Status

The first woman judge was selected in 1991. By 2010, there were around 50 women judges, though none were included in the Supreme Court. The justice system is strongly rooted in Islamic law. Law 10/1984, for instance, was judged to have been largely derived from the Maliki school of thought. Law 87/1973 merged Libyan civil and sharia courts, with the latter retaining control over the personal status cases. It is noteworthy that in contrast to sharia courts in other Middle Eastern countries, Libyan courts are presided over by graduates of law rather than Islamic experts (ulama), thus allowing for female judges.

The scope of justice is governed by the legislature and the Supreme Court, which has the power to declare laws unconstitutional. This power was used in 2013, when the court undertook a review and struck down Article 13 of Marriage Law 10/1984, which had required the first wife's consent for any further marriages leading to polygamy. This demonstrated how the few progressive gains for women in the Qaddafi period are open to being reduced by a new government with interpretations rooted in Islamic law. The same can be seen in regard to consistent criticism of the legal aid provided to family courts, which mostly supports women and children as well as ultimately providing employment for the female majority of family court lawyers. Because of the neoliberal approaches of the international institutions involved in Libya's reconstruction, in conjunction with the conservative Islamic interests and expedited by its association with the Qaddafi regime, the legal aid is under pressure.

Participation in Government

At the heart of Qaddafi's early reforms was the Basic People's Congresses, which coalesced into Municipality People's Congresses. Qaddafi spoke in 1976 at Tawergha, a Berber city that became a ghost town after 2011, arguing that excluding women from membership of the basic congresses would not be acceptable, though he sought to placate traditionalists by allowing the separation of the sexes at the meeting halls. Yet, even by 1986, participation of women in the Basic People's Congress was very low. No woman was in a position of authority in government. Although initially hostile to the tribes, the Qaddafi regime warmed up to the tribal leaders in the 1990s to gain legitimacy during a period of instability. He sought to instrumentalize tribal ties for political gain by instituting the "popular social leadership." Women were excluded from

the leadership, though they did participate in campaigning, and women activists were part of the organization at the city level. Women working in these spaces still do the bulk of the reproductive labor in the home, especially for children.

In 1997, the Charter of Rights and Duties guaranteed women the right to participate in the national political institutions. By the 2000s, women had gained leading governmental posts, such as minister of education, deputy speaker of parliament, and ambassador. Women also played key managerial roles in skills and rural development programs, thus allowing them to feed into decisions. However, only four women reached ministerial posts during the entirety of Qaddafi's reign. At the 2009 elections, 30 women were elected to the General People's Congress, out of 468 representatives (Doherty 2012). It is worth noting that some of the women who rose in the regime's ranks were not particularly progressive figures; for instance, Huda Ben Amr, the mayor of Benghazi, allowed severe repression of the early protests in 2011.

After the fall of Qaddafi, the Libyan National Transition Council included only one woman: Salwa Al-Dighaily, a constitutional law professor from Benghazi. Al-Dighaily would later resign in protest at the cosmetic addition of women to the council. The postuprising elections in 2012 saw 640 women running for office, with 33 being elected (16%), yet only 2 of these became cabinet ministers (Doherty 2012). In January 2015, a coalition of women's activists met and put together demands for amendments to the proposed constitution that would establish statutory obligations for women's representation in government, administration, and legislation not lower than 45 percent of all positions. At least one-third of the seats on the Higher Judicial Council would be filled by women. During the inauguration ceremony of the interim government in August 2012, a woman presenting at the ceremony, Sarah al Mesallati, was heckled by a male member for not covering her head.

Feminism, Women's Associations, NGOs, and Nonprofits

Women were given the vote in April 1964. In 1965, the Libyan Women's Union was formed, and it published the magazine *Al Mar'ah* ("The Woman"). The Women's General Union was founded in 1970, and this became the Jamahiriya Women's Federation in 1977. In 1975, the Union of Libyan Women was formed. There is also the General Union of Women's Associations that acts as

an umbrella for women's interest groups. In the Qaddafi period, women's civil society organizations were banned, with the exception of sanctioned bodies such as the Aisha Qaddafi Foundation. Official groups could have ambassadorial duties and were therefore closely monitored. In January 1978, for instance, the Jumhuriya Women's Federation received a delegation of American women in Tripoli.

Women took up a place at the front of the struggle to rid the country of Qaddafi. During the 2011 Libyan Spring, women were active in revolutionary acts, such as instigating an assassination plot against Qaddafi's son Saif al Islam, which led to their torture. Other women participated by acting as weapons smugglers and makers, such as Inas Fathy, or as radio hosts critical of the regime, such as Fatima Ghandour. The revolt itself was first sparked when women took to the streets of Benghazi to protest the arrest of the lawyer who represented political prisoners massacred at the notorious Abu Salim prison. The Karama organization called for the post-Qaddafi Libya to respond to women's demands to eradicate the abuses and discrimination of the previous regime.

The Libyan Women's Platform for Peace gained prominence as Libya descended into civil war, making demands for greater women's representation. Another women's organization that emerged after the revolution was named Woman Scream, which sought to protect women from harassment and attacks, both domestically and in public. The Voice of Libyan Women and the Libyan Rights Organization both undertook protests against the low number of 32 seats reserved for women in the National Congress elections of 2012. In January 2013, the Voice of Libyan Women hosted a conference in Tripoli for women's rights activists and encouraged a compromised figure of 35 percent of women as members of the Constituent Assembly. Activist Salwa Bugaighis was shot dead in Benghazi in June 2014.

Religious and Cultural Roles

Religion

Islamic practice is diverse, with most Libyan Berbers being reported to practice the Ibadi form of Kharijite Islam, though other Berbers had adopted the majority Maliki Sunni orthodoxy. Among some traditional Islamic practices, when a girl reaches puberty, she is considered impure and is not allowed to participate in public religious activity. Interestingly, public displays and congregations of religious expression thus remained largely a male preserve in the past. The attendance of women in

mosques is a relatively new phenomenon in Tripolitanian and Libyan society.

Women's Cultural Roles

Jewish Libyan women participated in the educational and religious functions of the Alliance Israélite Universelle. By the early 20th century, Jewish women were receiving an increasingly modern, and Zionist-oriented, education. By the 1940s, Jewish Libyan women were benefiting from teacher training as Zionist Libyans advocated notions of a "new Jewish woman." Other Jewish Libyan women, however, were educated in the Italian schools, leading to their confronting their religious identity and sometimes even marrying non-Jewish men. Yet, there were episodes of Jewish-Muslim cooperation; for instance, Jewish women in Tripoli in the mid-19th century brought the *tfina* bread to be warmed in the ovens of Muslim houses for fear of accidentally putting out the eternal fires during the Sabbath. Italian women had an important role in the settler colonization of Libya, being represented in Italian discourse as a new woman facing the challenges of modernity. Tuareg women were described in the 1950s as gathering for women-only fetes in the evening, where they shared stories about their lovers.

In 1952, a Turkish correspondent for *Cumhuriyet* noted the influence of Egyptian culture on the newly independent country and decried the segregationist conditions of women. Women began to have an increasing role in the postindependence period. In the 1970s, the editor of the popular daily *Majalat al Bayt* was a woman. Women in Tripoli have participated in a growing number of artistic and literary movements, and some have excelled in broadcasting, theater, and journalism, though the majority of public figures remained male. Cultural activities such as poetry and the media were crucial among the first and second generations of Libyan feminists that secured basic rights for women. The Internet has been widely absorbed, though Libyan often ranks among the lowest in user penetration for social media, according to the *Arab Social Media Report*.

Issues

Violence, Assault, and Human Rights

Sexual violence in conflict occurred well prior to the current decade. During World War II, Italian settler women are documented to have been raped by Allied troops.

The highest-profile case of sexual violence during the revolution was that perpetrated against Iman al Obeidy, a Libyan woman from Benghazi who claimed to have been raped by members of the military. This was but one of several such cases, though Obeidy's case was particularly publicized because she bravely went public.

In the post-Qaddafi period, the lack of a centralized state authority has led to the possibility of violent retributions that can sometimes drag women into the mix. Cases have been documented of violent militias "retaking" land that they claimed had been unlawfully expropriated by Law 4 in the 1970s. After the descent into civil war in 2014, sexual attacks became commonplace as bands of armed militias roamed the country. Because of the breakdown of central government post-2011, tribal justice applied to cases of sexual violence has been on the rise. Although this can sometimes be beneficial in ensuring the protection of women and a negotiation between families of victims and aggressors, there is also evidence of regressions, such as the forced marriage of women to their rapists. Women who have been interviewed note that the tribal system generally discriminates against them, and getting access to tribal leaders' discussion groups is generally very difficult.

Domestic abuse is rife and goes largely unchallenged because of social norms that emphasize the value of marriage as sacrosanct. Libyan law does not even consider the possibility of marital rape.

Trafficking, Refugees, and Prostitution

Following the fall of Qaddafi, the rape and sexual assaults of various refugees and migrant workers was cause for concern. Libya has emerged as the preeminent departure point for African and Middle Eastern refugees and migrants seeking better fortunes in Europe. Amnesty International has documented sexual violence, harassment, and rape against Eritrean, Somali, and Syrian refugees and migrants at the hands of Libyan smugglers. Prostitution is illegal. A U.S. Department of State report found that Libya was a destination and transit country for trafficking of male migrant laborers and sex rings of sub-Saharan women.

Self-Image and Identities

Urbanization has had an important role in changing women's place in social life. Many "modern" urban Libyan women drive and walk in large towns without the need for the traditional male relative as a companion. Young

women listen to a range of music, from Egyptian pop to Western classical music. Satellite television has had a jolting impact on women's self-perceptions of their roles and images as well as men's expectations. Women in Tripoli often visit beauty parlors and go shopping unsupervised by a male relative. Beauty standards were noted even before the "Westernization" of the country. One English traveler in the 1920s noted that among the Senussi upper class, "A woman may adorn herself richly [with jewels] in order to keep the favor of her husband and thus ensure a large progeny to Islam" (Forbes 1921). However, other accounts noted that the strictness of the Senussi order meant that, by the 1960s, few women were unveiling and working outside the house. Libyan Berber women were reported in the 1950s to not cover their faces and bobbed their hair.

M

Malawi

Overview of Country

The Republic of Malawi is located in the southeastern region of Africa. It is landlocked between Zambia to the northwest, Mozambique to the southwest and southeast, and Tanzania to the northeast. Approximately one-fifth of the country's landmass is covered by Lake Malawi. The population of Malawi is estimated to be more than 17.7 million in 2016 (CIA 2016). The average life expectancy is 59 years. More than two-thirds of the country's population lives beneath the poverty line, and another quarter of Malawians live just barely above the poverty line. In 2014, the World Bank estimated Malawi's gross domestic product (GDP) at USD\$4.258 billion (World Bank 2015), and the UN Development Programme (UNDP) ranked Malawi 174th out of 187 nations on both the Human Development Index (HDI) and the Gender Inequality Index (GII, 0.447) (UNDP 2015).

Land and Water

Human inhabitants were drawn to the water supply and living conditions in the region around Lake Malawi about 50,000–60,000 years ago. Lake Malawi is the largest and central feature of the present-day country. This third-largest lake in Africa is called Lake Nyasa in the neighboring country of Tanzania and Lago Niassa in Mozambique, a country to

the east of the lake. The plains and rolling hills of Malawi are approximately 60 percent agricultural and 34 percent forested. Agriculture makes up about 33 percent of the GDP, which is the amount of labor and goods produced by a country. Crops and animals raised in Malawi to sell include tobacco, sugarcane, cotton, tea, corn, potatoes, sorghum, nuts, cattle, and goats. These account for nearly all the goods exported out of the country. Tobacco is the number one crop. The country still depends heavily on water to support the way of life. Malawi uses hydroelectricity as nearly its only source of electrical power.

Before the 1840s, the region around the lake was inhabited by a number of tribal villages. People who lived there fished and traded, and occasionally they argued and fought over the use of the waters. For hundreds of years, fishing boats have gone out at night, equipped with lanterns. The scene they create with many points of light on the lake caused David Livingstone—one of Malawi's early European explorers and writers about the region—to call it the Lake of Stars. Disputes about who can use the lake have continued over the centuries, even to the present day, as Tanzania and Malawi argue over who has the right to drill for oil under the lake.

History

Some tribal groups living in present-day Malawi have lived for centuries in the region around Lake Malawi. Others

migrated into the area over the last two centuries to escape tribal conflicts, wars between European colonial powers, and the growth of the slave trade in Africa. Many of the larger ethnic-tribal groups can trace their roots to the Bantu people (and language), who have dwelled in Southern Africa for more than four centuries. The largest ethnic tribal group in Malawi is the Chewa tribe. They speak Chichewa, which is also Malawi's national language, along with English. Three tribal groups (Chewa, Tambuka, and Yao) speak Bantu languages and account for about half the population in Malawi.

Europeans began trading in the region around Lake Malawi in the 17th century, when Portuguese explorers came into the area seeking goods to trade. The area now called Malawi was also part of a network of pathways on which people were carried into slavery in other parts of Africa and Europe. The British explorer and missionary Livingstone reached Malawi in 1859. In the next three decades, Europeans brought their religions (Anglican and Presbyterian), education, and trade to the region. The area that includes all of present-day Malawi was declared a colony of the British Central Africa Protectorate in 1891, partially as a way to keep the Portuguese traders out of the region.

As the British Empire softened, and then dissolved following World War II, Malawi became an independent member of the (British) Commonwealth in July 1964. Dr. Hastings Kamuzu Banda (1898–1997), a man who was born and grew up in Malawi and then studied in Europe to become a medical doctor, became the first prime minister (1964–1966) and then president (1966–1994) of an independent Republic of Malawi. In 2012, after eight years in office, President Bingu wa Mutharika died suddenly, and the way opened for Malawi's first female president, Joyce Banda.

Poverty and Gender Inequality

Many Malawians live at or near extreme levels of poverty, and they experience less than adequate health care, education, and employment and suffer from a very low standard of living. In 2010, 66.7 percent of the population was multidimensionally poor, meaning people not only lacked financial income but also experienced little access to health care, education, or other goods and services for living. Another 25 percent live just above the multidimensional poverty rate.

Between 1990 and 2013, the poverty, health care, and educational conditions improved so that Malawi's HDI increased from 0.270 to 0.414 (UNHDR 2013). Yet, Malawi

is still ranked 173th out of 187 countries evaluated by the UNDP. In addition to the poor conditions faced by all Malawians, gender inequality, or unfair differences between men and women, boys and girls, is also significant in Malawi.

Three factors go into ranking countries for the Gender Inequality Index (GII), which tries to measure how much human development is lost when equality between males and females is lacking. The GII is based on reproductive health, political empowerment, and economic activity. Reproductive health consists of the rate of mothers dying in childbirth (or soon after from complications) and the rate of adolescent girls giving birth. The maternal mortality rate was 510 deaths per 100,000 live births in Malawi in 2014, and approximately 145 out of every 1,000 girls aged 15–19 delivered babies the same year. Political empowerment is measured by the number and percentage of parliamentary seats held by women and how many girls and boys reach secondary school (high school) and college. In Malawi, only 11 percent of girls and nearly 22 percent of boys attended some secondary school in 2014. The final measure in the GII is economic activity, which is calculated by the number of women and men who work for pay. In 2014, 84.6 percent of females and 81.5 percent of males were part of the labor force in Malawi. When considered altogether, these factors indicate that Malawi gets a rank of 174th out of 187 countries, 0.414, which is considered to be a low human development category by the United Nations.

Girls and Teens

Nearly half the population of Malawi (45.9%) is presently under the age of 15. The major challenges for young and teenage girls in Malawi are to stay in school and earn an education, to avoid child labor and being trafficked, to avoid transactional sex and sexual violence, to delay pregnancy and giving birth before being able to support themselves financially, and to escape the pervasive cycle of poverty. These problems are social and systemic and cannot simply be solved by girls making better choices, although helping girls and women make different choices can make a very substantial difference.

Only about 62 percent of the total population of Malawi over the age of 15 can read and write. Fewer than half of the adult women (49%) and more than three-quarters of the men (76%) are literate. A number of girls each year between the ages of 15 and 19 give birth, accounting for approximately 1 out of every 100 births in Malawi.

Educating girls offers a cure to many ills in developing countries. When girls are educated, population growth and teen pregnancies slow, health and well-being in families increases, and financial stability grows. Yet, this crucial key to improving the lives of Malawians, keeping girls in school, remains a challenging goal.

Girls and Water in Malawi

Water is of crucial importance in every place on the planet. In Malawi, where 20 percent of the country is covered with Lake Malawi, the availability of safe, clean water for everyday life remains ironically difficult. In the last 10 years, Malawi has experienced long periods of time when rain has not come, and the droughts have compounded the water problems. A lack of infrastructure (pipes, roads and vehicles, rails, power, etc.) to deliver groundwater to villages means women and girls spend a lot of time carrying water in large plastic buckets to their homes and villages for drinking, washing, cleaning, cooking, and growing gardens. They may have to carry water as many as five or six times a day. The time it takes to carry water can prevent girls from being in school and adult women and mothers from having time for earning a better living. Additionally, the lack of wells and plumbing mean a lack of usable water for handwashing, which contributes to the spread of disease. As many as 3,000 children a year die of water-borne diseases that cause diarrhea and dehydration. Only about 2 in 10 people in Malawi have access to bathrooms with plumbing. The lack of water and public bathrooms in schools also make staying in school after girls reach puberty more challenging (WaterAid 2016).

The most effective solutions to the water problems faced by girls and women in Malawi are found in local organizing. For example, when the nongovernmental organization (NGO) Watering Malawi provides funds to place treadle pumps in villages, more people gain access to safe water for drinking, cleaning, cooking, and gardening. The pumps become the responsibility of local “mother’s clubs,” which educate and train women, oversee the maintenance of the pumps, and keep a fund for making repairs. These mothers also work together to raise better food in their gardens so that the nutrition for their children improves (Watering Malawi 2016).

Trafficking and Child Labor in Malawi

Children grow up quickly in Malawi. Some children work safely in family businesses. However, as many as one-third

of children under the age of 18 are forced into child labor, working in situations that are often unsafe and unpaid and that keep children away from school. As many as 1.5 million children become child laborers on farms (tobacco, tea, coffee, and sugar plantations); in the fishing industry; in livestock herding; as household servants; and by begging and selling wares on city streets. In some cases, children are forced into sex work and exploitation, which means using someone in a way that helps the strong person but is unfair or harmful to the other more vulnerable person (U.S. Department of State 2015).

In Malawi, it is illegal to force children to labor. In February 2015, parliament passed new antitrafficking laws and put in place more ways to convict those who traffic children and others for labor or sex work. Human trafficking involves the intentional treatment of people (including children) as possessions to be used and sold. In 2015, the government identified 242 trafficking victims. However, the government depends heavily on nongovernmental agencies to do on-the-ground preventative work with victims of trafficking. One effective program is the Support for the National Action Plan (SNAP), which combats child labor in Malawi. Begun in 2009, and funded by the U.S. Department of Labor, the program has worked with more than 5,500 children to withdraw them from forced labor.

The SNAP program formed local committees who meet regularly, inspect farms and businesses for child laborers, and collaborate with local village chiefs to change the understanding and to reject the acceptability of child labor in Malawi. The SNAP program works to redirect young children back to schools and older children in their teens to learn vocational and business skills so that they might be equipped to work legally for fair pay and to own businesses of their own. SNAP also provides training and support to families, helping them earn income that does not require using the forced labor of their own children.

Many teenage girls are forced into labor as domestic servants for cooking, cleaning, and caring for homes and children, with long hours and little or no pay. SNAP is changing their circumstances by making contracts available to girls old enough to work legally. The contracts protect the teenage girls by providing fair pay, reasonable hours, better working conditions, breaks for food, and time to spend in training with other teens who are also hoping to improve their lives and working skills. The contract is signed by the girl who works, her employer, the village chiefs, and representatives of the Community Child Labor Committee (CCLC). Older children and teens learn

carpentry, tailoring, and other business skills to make a more sustainable living.

Health

Health care in Malawi is challenged daily by the lack of resources and personnel to provide care as well as a very high birth rate and lack of available modern methods of birth control. Additionally, a number of communicable diseases such as tuberculosis (TB), malaria, HIV/AIDS, and other tropical diseases are major causes of death in a situation where the life expectancy is significantly lower than developed countries at 59 years (60 for females and 58 for males). In addition to socially transmitted diseases, there is also a rise in noncommunicable diseases—often associated with stress—such as diabetes, hypertension, and cancer. Although there has been a decline of malaria cases by nearly 30 percent between 2010 and 2014, for children under five years old, the disease remains deadly. For these young children, malaria, which is spread to people by infected mosquitoes, accounts for 34 percent of doctor and clinic visits, about 40 percent of the trips to the hospital, and approximately 40 percent of all child deaths while in the hospital (WHO 2016).

Because women give birth, the health care needs of girls and women are greater and more complex than the health care needs of men. Access to adequate contraceptives (ways to prevent or control birth and to protect females from sexually transmitted diseases) and delivery doctors or midwives are not sufficient in Malawi. Use of contraceptives to prevent pregnancy and disease increased from 7 percent in 1992 to 26 percent of married adult women in Malawi in 2000 (Heard et al. 2004). Still, more than half (54%) of pregnancies in Malawi were reported as unwanted in 2013.

Only 58 percent of women who want to prevent or delay pregnancy have access to modern and reliable birth control measures. Another 5 percent were using traditional methods of periodic abstinence (trying to anticipate fertility days and avoid sexual intercourse). And 38 percent were using no method of birth control at all. The most widely used form of birth control in Malawi is an injection of hormones that prevents the woman from becoming pregnant. Other modern methods of birth control include female surgical sterilization (21%), condom use (8%), medication taken daily by mouth (5%) (Vlassof and Tsoka 2014).

Aborting a pregnancy is illegal in Malawi, except to save the woman's life. However, as many as 78,000 women each

year receive secret and unsafe abortions, leading to many health complications for the women. Illegal and unsafe abortions cause as many as 18 percent of the recorded maternal deaths in the region of Southern Africa (Vlassof and Tsoka 2014).

Maternal Health

Nearly one-third of women in Malawi use modern birth control methods to control when they will have children and how many children they will have. Many more adult women say they do not have access to the contraception methods they need. Maternal health services must legally be provided to women regardless of their marital status. The Gender Equity Bill adopted in 2012 guarantees the availability of reproductive and other health care services to women; however, it is often ignored, and the availability of medical caregivers is less than adequate. Although no woman's spouse is required to be present while she makes health care decisions, many women (44.8%) report that their husbands make health care decisions for them. Women who work for pay are eligible for maternity leave of eight weeks with full pay (100%) when they deliver a child. This leave can be used once every three years, and employers must pay for the benefit to each worker (SIGI 2016). As noted above, the death rate for mothers in childbirth remains high (510 of every 100,000 births), and the number of girls giving birth between the ages of 15 and 19 (145 per 1,000) indicates that multiple concerns remain for the health of mothers in Malawi (UNDP 2015).

Disease and Injury

The leading diseases that threaten life and health and cause some lasting disabilities in Malawi include HIV/AIDS, lower respiratory infections, malaria, diarrhea-related diseases, pregnancy, tuberculosis (TB), traffic accidents, and heart disease. In the 10 years between 2001 and 2011, malnutrition, maternal deaths, and drowning dropped out of the top 10 leading causes of death.

Acquired immunodeficiency syndrome (AIDS) is a chronic health condition that remains the leading cause of early death in Malawi. AIDS is the full expression of the human immunodeficiency virus (HIV). The HIV virus is transmitted between humans by sexual contact or exchange of blood, for example, when hypodermic needles are used on multiple persons. HIV damages a person's immune system and hinders the body's ability to fight the organisms that cause disease. In 2014, the rate of HIV/AIDS in Malawi

was 10.3 percent of the population. It peaked at around 16.4 percent in 1999 and then began to decline (Wilson 2013). The rate for men and women is disproportionate; more women are contracting the disease, and more urban than rural women are testing positive for HIV.

The main way that HIV is transmitted in Malawi is through unprotected heterosexual sex. HIV affects women in greater numbers than men in Malawi. In 2010, 12.9 percent of women were HIV-positive, but only 8.1 percent of men had HIV. Young people under age 19 make up over half the new cases of HIV. As of 2014, girls were contracting HIV at much higher rates than boys. Among girls aged 15 to 17, 3.7 percent became HIV-positive as compared to only 0.4 percent of boys the same age (UNAIDS 2013).

According to the U.S. Centers for Disease Control and Prevention (CDC), which operates in Malawi, as of June 2013, there were 443,221 HIV-infected persons living in the country and currently taking antiretroviral therapy (ART) drugs. The access to ART medications is a major factor in the decline of HIV/AIDS in Malawi (Gupta and Tippet-Barr 2016). In particular, a new emphasis on treating pregnant mothers who test positive for HIV/AIDS is successfully reducing the number of babies born HIV-positive.

Education

The system of formal education in Malawi begins with eight years of primary education and continues with four years of secondary education (high school), followed by four years of university education. Students must pass an exam, the Primary School Leaving Certificate Examination (PSLCE), to enter secondary school. After two years of secondary school, they take the Junior Certificate Examination (JCE). Those who complete four years in secondary school take the Malawi School Certificate Examination (MSCE). Other kinds of education and training include teacher training colleges, technical and vocational training schools, and university colleges. To begin university, an MSCE is required. To enter teacher training colleges and technical schools, one must have either a JCE or a MSCE (Castel et al. 2010). The teacher-to-student ratio in primary schools is 1 teacher per 80 children.

Keeping girls in school and building literacy skills for girls and boys in Malawi is an enormous challenge. Schooling is available to children beginning around age 5. In 2010, surveys showed that less than 40 percent of the students eligible for school at age 5 were attending. Enrollment numbers grew for children up to ages 10 and 11, where the

peak of enrollment hit about 90 percent. After age 11, the percentage of young people in school drops dramatically, and even more dramatically for girls. Just over 51 percent of adult females (over the age of 15) in Malawi were estimated to be literate in 2010. By 2015, that number rose to 58.6 percent, indicating some improvements to education and literacy (Castel et al. 2010).

In addition to the problems of children being drawn into forced labor and the lack of infrastructure (buildings, teachers, teaching materials, etc.) to provide adequate schooling, girls face a very practical challenge regarding staying in school. When they reach puberty and begin to menstruate, girls frequently do not have adequate water or bathroom facilities at school to stay and care for their bodies. Instead, many of them stay home the week of their period rather than attend schools with no bathrooms. One of the most basic ways to improve education for girls in Malawi is to improve access to water by building more “loos.” A number of NGOs are working to provide more wells, access to hand-washing stations, and more loos for schools. This will help more girls stay in school in Malawi. Girls also drop out of school when they become pregnant or get married.

Employment

In Malawi, 88 percent of people get by on less than the equivalent of USD\$2 per day (UNHCR 2013). This does not mean they do not work. In fact, 85 percent of the female population and 82 percent of the male population work. A large percentage of Malawi’s women live in rural areas where they do as much farming as they do home care and child-rearing. They also sell their goods as vendors in local markets. Men, and especially those with multiple wives, work less. Yet, the vast majority of Malawians are the working poor. The UN Multidimensional Poverty Index (MPI) measures both poverty from a lack of income and poverty related to a lack of health care, education, and standard of living. In 2010, MPI results showed that fully two-thirds of Malawians, more than 10 million people, lived in multidimensional poverty, and another one-quarter, 3.7 million people, were living at the brink of multidimensional poverty (Kalinga and Crosby 2001).

One source of employment in Malawi is the making and selling of garments and special cloths used for religious and political occasions. More than a simple pragmatic task, printed cloth in Malawi is a part of the national dress and identity of Malawians, especially girls and women. The colorful dress style, which was imported from Europe

to East Africa in the 19th century, is available everywhere in 21st-century Malawi. When Scottish colonizers arrived in Malawi, they changed the economy and brought with them influences of mass manufacturing as part of the industrial revolution. Initially, they shipped in cloth for trade to the region, but Malawians and others soon learned how to make the new fiber technology their own.

Women and girls in Malawi often wear a style of dress made from *chitenje*, a brightly colored rectangular cloth, which is usually between two and four meters long and about one meter wide. These fabrics made in Blantyre, an industrial city in the south of the country, are printed in geometric and floral designs. The style is to wear the cloth as a skirt or as a fully wrapped dress. It is also worn as a head scarf and sometimes used as a sling for carrying babies.

Additionally, *chitenje* are also printed with patterns that include messages, images, and designs that convey the values of both religious and political groups. The cloths are also used in funeral services to commemorate public figures, such as presidents. The image of Bingu wa Mutharika was memorialized on thousands of cloths within two weeks of his death in 2012. Women and girls continue to wear those garments to keep his memory alive. Although men do not wear *chitenje*, the same political designs are printed on hats and T-shirts. The political dancers (nearly all women) also wear images of political candidates and officials printed on *chitenje* in their dances. Political rallies also include party symbols on cloths hung throughout the gathering spaces.

Sometimes new designs are commissioned by religious groups to commemorate events or to raise funds for churches or spiritual groups. Women are often involved in each stage of choosing events and dates for commissioning a new cloth. They help in the design and production of the cloth as well as its sale and distribution. A record of each creation by color and design is recorded in a log at the production factory. Researcher Sarah Worden explains that the church cloths are an “important statement of shared female identity within the church, often dressing many hundreds of women in thousands of meters of matching cloth . . . commissioned for church choirs, for church conference delegates, to commemorate anniversaries of church officials, buildings and events” (2014).

Family Life

Family life in Malawi is largely governed in rural areas by the traditional tribal cultures and rituals, which support

a worldview of people, spirits, and animals of the bush (forested areas around a village). While modern statistics tell one story of family life in Malawi, the Chewa people, who make up more than 10 percent of the population, provide a different kind of insight into the families of rural Malawi.

When the British colonized the region now called Malawi in the 19th century, the powers of tribal chiefs and the social organizations of villages were undermined by the Europeans who imposed their ways of life, religion, and organizing onto the people of the colony. Even when British colonial rule ended in the 20th century, the new Malawian government continued to thin out and undercut the economic and political powers of local village chiefs and turn them into mouthpieces for the central government rather than local leaders. While the chiefs (or headmen) lost some powers, they maintained their *ritual* power, including the village ceremonies for births, initiations, marriages, and death rites that maintain the social fabric and family life. For the Chewa people—the largest tribal group in Malawi—these ritual functions remain lodged in the Nyau dance (Kaspin 1993).

Among the Chewa, not only did the ritual powers of the village remain in the hands of the chiefs, the rituals themselves became a means to resist and poke fun at, first, the European colonizers and, later, the Malawian government officials. In the southern and middle regions of Malawi, the Chewa tribes and chiefs were stripped of political and economic powers in the 19th and early 20th centuries. At the same time, the European missionaries, both Presbyterian and Catholic, attempted to end the practice of *gule wamkulu*, or “great dance,” which was the central feature of social, family, and ritual life in Malawi. The efforts to remove the masks or drums or to demand an end to the dancing so that villagers would become Christian actually helped to set the stage for maintaining the rituals and keeping alive the traditions of precolonial life through the rituals, stories, and worldview tied to the dance. The improvisations to the great dance over time—changes based on new demands and new circumstances—resisted the religious and economic demands of the white colonizers.

The Nyau dance tradition separates the men and boys from the women and girls in the villages where it is practiced. The dance also represents the worlds of the flesh and the spirit, life and death, and male and female. The divisions are all complementary—each part is essential for completing the other. The result is an asymmetrical or unequal kind of power for males and females.

Most marriage relationships in Malawi are not based on shared or equal power. Men can often have relationships with other women while they are married, can commit rape (forced sexual engagement) with their wives, or prevent their marriage partners from accessing or benefiting from family property. Outright abuse remains acceptable to many: 35.7 percent of all women (38.2% rural and 22.4% urban) think it is acceptable to be beaten by their husbands. Often husbands marry more than one wife, and 17 percent of all women are part of polygamous unions (single males married to multiple females). The unequal power and normalization of violence means that as many as 70 percent of married women are not free or able to make critical personal decisions for themselves (Banda 2005, 19–20).

One organization and movement to counter gender inequality, begun in 1997, is the Malawi chapter of Men for Gender Equality, Now. The group works to eliminate gender-based violence and the spread of HIV/AIDS. In addition to training and workshops, the group sponsors local “rapid-response teams” that intervene in social situations to de-escalate domestic violence.

Homosexuality has been illegal in Malawi since 1930, based on laws put in place during the colonial period and adopted by the Republic of Malawi after 1964. The crime of having “carnal knowledge of any person against the order of nature” is punishable by up to 14 years in prison. Since 2010, the law has been a point of controversy and public debate. Foreign governments and nongovernmental funders of relief programs in Malawi have threatened to pull funds if the country continues to criminalize homosexuality. Several high-profile cases of arrest and jail time, as well as interventions by the United Nations, received extensive media coverage. In 2012, President Joyce Banda put a moratorium on enforcing the law. Other legal scuffles continue in 2016 in both religious and political venues over the future of the issue and laws surrounding it.

Child Marriage in Malawi

As was the case in traditional rural settings of Malawi, young girls could be taken in marriage by older men. However, the problem remains. Although child marriage is illegal in Malawi, it continues and usually prevents girls from completing secondary education, results in girls giving birth at early ages, and in effect keeps the poverty cycle in place. In 2014, the World Health Organization (WHO) rated Malawi among the top 10 countries in the world allowing child marriages. In Malawi, 12 percent of

children are married before age 15, and 50 percent are married before age 18. More girls than boys are married as children. Girls who are married early in Malawi are more likely to have no formal education (66%), but women who continue to secondary education are much less likely to be married as children (5%).

Sexual Initiation Rites and Dancing for Rights

In the central and southern regions of Malawi, sexual initiation rituals for adolescent children remain common. Among the Chewa people, the initiation rights are grounded in the long tradition of Nyau, in which boys are initiated to become predators and females are initiated to become the pursued, supporting unequal power roles for males and females. The secret societies for men and women pass on knowledge about village life and the worldview of Nyau, but they also train boys and girls on how to take on gender roles and participate in sexual activity in ways that fit that worldview. Generally, the female roles are passive, and the male roles are active.

For many girls in rural Malawi, the initiation rites operate like a camp. They are taken away from the village with other girls and initiated into womanhood through introductions to how they should engage in sexual relations with men. Traditionally, the initiation rites were customs that taught girls how to become respected and empowered in their communities. However, some girls are urged to practice what they learn in the initiation rites immediately upon leaving the camps. Girls are warned (falsely) that if they do not comply, they may have physical effects, such as becoming “dry and brittle,” that will last a lifetime. Unfortunately, the initiation rites do not teach the importance of protecting oneself from sexually transmitted diseases such as HIV/AIDS, which is still a major health threat, especially for young girls, or pregnancy. Additionally, girls who get married or become pregnant drop out of school, and without education, the cycle of poverty continues.

In extreme cases, girls are forced to undergo a “cleansing” by having sex with an older man, a “hyena” who travels through the villages having unprotected sex with newly initiated girls to rid them of the “dust of childhood.” These men are paid for their services. Hyenas are also paid to provide cleansing sex with widows so their dead husbands will not haunt them. The cleansing rituals are unsafe for both girls and widows, as the unprotected sex may expose them to HIV/AIDs or other sexually transmitted diseases (Ahmed 2014).

As a counterpoint to the female initiation traditions in Malawi, the Girls' Empowerment Network leads girls and women, as well as men and boys who are their allies, to challenge the traditions of initiation that lead to child marriage, pregnancy, disease, loss of education, and continued poverty. The network works to empower girls through education and advocacy, and they sometimes use drama and dance. By using the same cultural forms familiar to the people of southern Malawi, the Girls Empowerment Network is transforming the practices of storytelling, drumming, and dance into powerful messages about staying in school, avoiding unprotected sex, and saying no to child marriage. They are teaching girls to use their voices and to take action to use their own power and make better lives for themselves (Girls Empowerment Network Malawi 2016).

Politics

In the early 20th century, the Nyau dancers and the network of village chiefs worked with the Malawi National Congress to end colonial rule of the country and speed the transition to independence. Thus, the Nyau dancers remained affiliated with the new ruling party of Malawians. However, by 1980, the new independent rulers, feeling threatened by the local and traditional powers of the Nyau dancers and tribal headmen, further stripped the powers of the Nyau and removed their "animal" powers by exposing them as mere men in disguise rather than powerful embodied spirits. Nevertheless, at the local level, the worldview and politics of the village is still operational in many rural areas of Malawi. The schools, teachers, and government officials are associated with Christians, who maintain official power in the communities. However, the everyday power of decision making has been largely incorporated into the ritual and local worldview of the local chiefs and ongoing tribal traditions.

During the interim period between colonial rule and independence, Dr. Hastings Banda advocated for women's suffrage (right to vote). Banda and the women's right to vote were heavily opposed, and sometimes Banda was rebuked by other political officials. However, in 1961, during the transition period, Malawian women exercised their political voice and voted for the first time, but only if they had been married for up to 10 years. They made up less than 10 percent of the voters. In 1964, one of the few women elected to Malawi's parliament, Rose Chibambo, advocated for women's rights, and she was booed openly by male Malawian politicians. In 1993, Banda became ill,

and as he stepped aside after more than 30 years of leadership, the country voted by referendum to adopt a multi-party system.

Malawians elected Bakili Muluzi as president in 1994 and voted for a formal democracy. This was really only the second time women (or men) were able to vote for the party of their choice. Muluzi immediately freed political prisoners and restored freedom of speech. He led the country for 10 years. During that decade, the World Bank canceled half of Malawi's overseas debt, and a railway to the Indian Ocean was opened, creating more opportunities for trade. However, drought struck in 2002, and the president was forced to sell off many of the crops prematurely, throwing Malawi into another political and economic crisis.

In 2004, Bingu wa Mutharika was elected president, and despite a tumultuous term marked by famine, political turmoil, and accusations of high-level government corruption, he was reelected in 2009. In 2012, Mutharika died, and he was succeeded by Vice President Joyce Banda, making her the first female president of Malawi. At the time she was taking office, Peter Mutharika, a former foreign minister and professor and the brother of the deceased president Bingu wa Mutharika, was charged with treason, allegedly as part of an effort to prevent Joyce Banda from taking office. However, charges against him were dropped in 2014 when he was elected president. Elected peacefully in 2014, the current president of the Republic of Malawi is Professor Arthur Peter Mutharika, and the vice president is Saulos Chilima.

Current Legal Rights

Malawi has been a partner with the Millennium Challenge Corporation—an organization funded by the U.S. government—since 2005 (MCC 2016). Malawi and MCC currently have a five-year, USD\$350 million compact to improve the hydroelectric power system in Malawi. To assess the readiness of Malawi (and all of the 44 developing countries funded by MCC), the country is assessed annually for its current legal and economic rights and improvements. Three of the areas of assessment in Malawi are related to gender. The assessment includes these questions: Can women get a job, register a business, sign a contract, open a bank account, choose where to live, get passports, travel domestically and abroad, pass on citizenship to their children, and become heads of households? To indicate *yes*, a woman must be legally able to do each activity in exactly the same way as a man. If a woman cannot do these activities just like a man, then the indication

is *no*. Malawi's legal status for women has improved notably in recent years, and the assessment indicates a *yes* for women on all these rights except applying for a passport, which is still unavailable to married women in Malawi because their husbands must apply on their behalf.

Political Dance in Malawi

During President Hastings Kamuzu Banda's 30-year presidency (1964–1994), he led a single-party government organized by the Malawi Congress Party (MCP). The hierarchy in the party included a requirement that all women in the country of Malawi be trained and prepared for a form of political dance. The dances were modeled after ancient tribal dance forms and nationalistic resistance dances from when the British colonial powers were overturned in the 1950s and 1960s. However, the political dances of Banda's era included new features, such as women wearing political symbols and pictures of the president on their dresses, dancing in massive political events, and singing the praises of the president. Fear of punishment or imprisonment kept silent any public debate about using women as the president's cheerleaders.

In 1993–1994, unrest in Malawi led to a new multiparty system of elections. The new candidates for president promised not to force women to dance any longer. The promises led to a reduction in women's political dancing. Many in Malawi now claim that women are free to choose to dance or not. However, the forms of dance, the wearing of political symbols, and the praise of political candidates continued into the 21st century, much as it did during Banda's presidency.

Religious and Cultural Roles

The ancient tribes of Malawi were primarily animist, holding to a belief that God created every living thing. Among the Chewa people, the central religious and ritual act is the *gule wamkulu*, or "great dance." Those outside Malawi know the ritual mainly for its use by men and boys as they are initiated into manhood. However, both men and women participate in the dances, which are used for many rites of passage. Each dance is part of the male and female segregated secret societies. The men in particular wear elaborate costumes of animals, spirits, and even contemporary figures, including large colorful masks. The dances are performed at initiation rites, marriages, funerals, and the installations of tribal leaders. The masks worn in the dance represent various spirits of both life and death, often

fearsome in their size and presentation. The purpose of the dance is to express beliefs and a total sense of culture, religion, and ancient tribal practice, communicating messages from ancestors and animals in the bush. The great dance calls on the spirits to help with growth for crops and fertility for people and every aspect of ongoing life.

Islam entered the region now called Malawi from the east and along early trade routes toward the Indian Ocean. With the entrance of missionaries and colonizers like Livingstone and others in the 1850s, a new religion entered Malawi. In 2014, the religious affiliations in Malawi are 86 percent Christians and 13 percent Muslims. Other religious groups in Malawi include Jews, Hindus, Bahais, and atheists. The mostly Christian population is approximately 20 percent Roman Catholic and 16 percent Central Africa Presbyterians. Other Protestant groups include Seventh-day Adventists/Seventh-day Baptists, Anglicans, and non-denominational Christians (U.S. Department of State 2014). Some of these groups, particularly Presbyterians and Catholics, will excommunicate or exclude Malawians who continue to practice *gule wamkulu*. Because many Malawians still practice the great dance, the attempts at exclusion have the effect of driving it deeper into secrecy.

European Christian missionaries in the 1920s and later thought their call for ending polygamy would liberate Malawian women, but the idea did not work especially well, as women were forced to leave their families and came to reside in the Christian missions. Rather than being educated for survival skills, women and children became domestic workers in the missions of both Protestants and Catholics. In 1999, Martha Belida Mwale became the first woman ordained as a Presbyterian pastor in Malawi. That same year, women entered military training in the Malawian Army for the first time as well.

A recent study of the effect of religion on the spread or prevalence of HIV/AIDS showed no difference among women with HIV/AIDS from the various religious groups, from Protestant to Catholic to Muslim. One possible explanation of the lack of difference between groups may be a "lack of sexual network boundaries in Malawi, defined by religion" (Adamson 2009, 54).

Mali

Overview of Country

Mali is a landlocked country in the interior of West Africa. It is the eighth largest country in Africa. The country borders Algeria to the north, Niger to the east, Burkina Faso to the southeast, the Ivory Coast to the south, Guinea to the southwest, Senegal to the west, and Mauritania to the northwest. Mali is roughly 770,619 square miles, and 65 percent of its land is desert or semidesert. As of January 2015, the population of Mali was 16,955,536 million, with slightly more than half (50.4%) of the population women (CIA 2016). Mali is a former colony of France that gained independence on September 22, 1960. In 2013, the Human Development Index (HDI) 2014, which considers income, literacy, education, and life expectancy, ranked Mali 179th out of 188 countries worldwide. Furthermore, UN

Development Programme's (UNDP) *Human Development Report* ranked Mali 143rd out of 146 countries in gender inequality (UNDP 2017).

Gendered structural inequalities in Mali are pervasive; as a result, women face different forms of discrimination, including limited access to education, employment, and the political arena. Women are exposed to violence, including rape, domestic violence, female genital cutting and mutilation (FGC/FGM), and early and forced marriages. International human rights law prohibits discrimination based on sex and includes guarantees for men and women to enjoy their civil, cultural, economic, political, and social rights equally; yet, systematic discrimination against Malian women is widespread and overlooked. Furthermore, Mali ratified the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) in 1985, but the government did not include a provision for domestic violence. Equally important, Mali sanctioned the Optional Protocol to CEDAW and the Protocol to the African Charter on Human Rights of Women in Africa; however, the provisions of these initiatives are widely ignored. Unless the Malian government acts appropriately, including creating legislation to outlaw gender discrimination, women will remain oppressed and the majority of the poorest population.

Education

Globally, education is considered the dreams and aspirations of families and their children that will lead them from poverty and to a happy life. As elsewhere in sub-Saharan Africa, education in Mali is characterized by extensive gender inequality. Women and girls are poorly represented at all levels of the education system. Article 26 of the United Nations' December 10, 1948, Universal Declaration of Human Rights clearly articulates that "everyone has the right to education," yet this fundamental right remains elusive for women in Mali. Furthermore, during the global conference on Education for All (EFA) in Jomtien, Thailand (1990), Mali committed to make primary education accessible to all children and to reduce illiteracy before the end of the decade. Nevertheless, more than 25 years later, Malian women have not benefited from this commitment. It is also noteworthy that world leaders committed to achieving universal primary education by the year 2015 as one of the Millennium Development Goals, but despite widespread support to achieve universal primary education by 2015, Mali failed to meet the target (UNDP 2017).

Education for women in Malian society is not promoted; as a result, there are pronounced gender gaps in literacy and levels of educational attainment between females and males. In 1960, when Mali became independent, only 7 percent of its population was educated. According to Marie-France Lange (2003), Mali experienced four main periods of growth for primary education after independence: 1960–1979 had a steady enrollment growth; 1980–1985 had decreased attendance; 1986–1990 was marked by a revival of huge enrollment; and that brought a big surge in enrollment in 1991–2001. Despite the large enrollment growth, the enrollment rate of girls did not grow as fast as for boys; hence, gender parity declined significantly in 1990–1991 and 1997–1998. Although the gender gap narrowed to 0.62 in 1993–1994, the progress remained uneven but significant, and in 2001–2002, the parity reached to 0.73. As reported by the UNDP, gross primary enrollment for girls was 74.9 percent, compared to 92.2 percent for boys (UNDP 2017). Moreover, CEDAW described primary school enrollment increases for girls: from 19.1 percent in 1988–1989, to 31.4 percent in 1994–1995, to 33.4 percent in 1995–1996, to 36.5 percent in 1996–1997, to 44.5 percent in 1999–2000. Despite the growth, corresponding figures for boys were higher: from 19.1 percent, to 33.1 percent, to 46.9 percent, to 51.3 percent, to 64.19 percent, respectively (2017).

Notwithstanding the high attendance record in primary school, parity remained an enormous problem. Nearly 900,000 children aged 7–12 were denied the right to an education, and the majority (60%) were girls, compared to 40 percent for boys. Yet, some segments of the female population still suffer from extreme educational exclusion; in northern rural regions of Gao, for instance, school attendance for females is 30 percent, and the dropout rates for primary education is alarming. One study reported low educational attainment for women in secondary school of 10 percent in 2006. Equally important, the study points to a low percentage of women with secondary and higher education at 7.1 percent; men had 15.2 percent, twice the rate of women (Kuepie, Dzossa, and Kelodjoue 2013).

A UN Educational Scientific and Cultural Organization (UNESCO) study of adult and youth literacy from 1990 to 2015, for 41 selected countries, placed Mali among three countries with the lowest Gender Parity Index (GPI) value, 0.47, in 2010. CEDAW found low levels of female youth literacy of 34 percent and 56.4 percent for males, making for a gap of 20.4 percentage points (UNESCO 2012). Another study postulated that poverty and discrimination are

some of the key determinants of girls' levels of educational attainment; fewer than 2 in 10 girls from poor households completes primary school, compared to 7 in 10 boys who come from affluent urban households (Pearce, Fourmy, and Kovach 2009). Kuepie, Dzossa, and Kelodjoue found the proportion of women over age 15 who were literate and could read a sentence in French (the national language) was only 17 percent in 2006 (2013). Mali is among seven countries, all in sub-Saharan Africa, with very low literacy rates.

Despite substantial gains in enrollments and access to school over the last two and a half decades, gender parity remains a grave problem; consequently, a large majority of the female population continues to be poorly represented at all levels in the education system and still suffers from educational exclusion. These large gender gaps demonstrate how far Mali has not come in addressing gender inequality and exclusion. To be successful in closing the gap and to reach equity, Mali must focus its efforts on being inclusive at all levels. Educated girls and women are likely to marry at an older age, have fewer children, find employment, and make the best health decisions for their children.

Health

Access to Health Care

Mali only spends 6.9 percent of its gross domestic product (GDP) on health care (WHO 2015). Life expectancy is only 53 years. This reflects the poor state of health care in the country and the high levels of poverty. About half the population lives in poverty (WHO 2015). There are few hospitals, and there is only 1 doctor for every 10,000 people in Mali; however, the hospitals are likely to incorporate effective traditional cures and treatments into their practices. Forty-seven percent of the population is under the age of 15. Improved drinking water is available to more than 60 percent of the population, but only 20 percent has access to sanitation facilities. Diseases such as cholera and meningitis are common due to sanitation issues (WHO 2015).

Maternal Health

Only 8 percent of women in Mali use some form of contraception, and the fertility rate in 2013 was 6.8. The situation is dire for women's reproductive health. For a woman between the ages of 15 and 49, there is a 44 percent probability that she will die from maternal causes. The maternal

mortality rate dropped from 1,100 per 100,000 in 1990, to 550 in 2013, but this number is still very high. Only 35 percent of women attend four or more antenatal appointments, and 58 percent are attended by a skilled birth assistant. The mortality rate for children under the age of 5 has also declined from 1990 to 2013 (WHO 2015).

Diseases and Disorders

Unlike many countries in Africa, HIV rates are very low—only 1 percent—but many children have been orphaned when their parents die (WHO 2015). Malaria rates are high and the subject of many interventions. Women are most likely to die from maternal, neonatal, and nutritional causes, followed by heart disease and diabetes.

Female Genital Cutting and Mutilation

In 1990, the Vienna World Conference on Human Rights classified female genital cutting (FGC), sometimes called female genital mutilation (FGM), as a form of violence against women. Furthermore, on December 31, 2012, the UN General Assembly passed a resolution to eliminate FGM worldwide. Female genital mutilation is the partial or total removal of the clitoris and other cutting in the female genitalia for reasons other than medical. As reported by the United Nations, FGM is widely practiced in 28 countries in Africa as well as countries in the Middle East, Asia, and other communities worldwide (UNESCO 2012). Although FGM is not illegal in Mali, it is illegal to perform the procedures in government-run health clinics. Opponents of FGM emphasize that the practice can have life-threatening consequences, including chronic infections, psychological trauma, and severe pain during urination, sexual intercourse, menstruation, and childbirth. Proponents argue that FGM is a cultural practice that is traditionally justified. Unfortunately, Mali has not yet set legislation outlawing FGM, as neighboring countries have. Thus, FGM is common in Mali and remains a deepening problem.

FGM is an integral part of Malian societies and is deeply rooted in tradition and culture. According to the United Nations, roughly 70 million girls and women in Mali have undergone FGM (UNESCO 2012). In 2014, the estimated prevalence of FGM in girls and women aged 15–49 years was 91.4 percent, a reported increase from 85.2 percent in the 2006 Demographic and Health Survey (DHS) (28 Too Many 2014). Furthermore, when FGM prevalence is

compared by faith, Muslims had a higher rate (92.8%) than Christians did (65.2%). Also important, a large proportion of women (76%) and men (69.5%) defended FGM as a justified traditional rite of passage. Other studies concluded that both FGC and FGM are particularly rampant in rural areas. A survey of 9,704 women aged 15–49 revealed that 93.7 percent had undergone either FGM or FGC (DHS 2015). Additionally, 96 percent of women and girls in rural regions had been circumcised compared to 92 percent of women and girls in urban areas. In 2013, they found similar results of FGM in rural areas (91.8%) compared to urban centers (90.5%) (DHS 2015). The Office of the Senior Coordinator for International Women's Issues also discovered an alarming surge of FGM in more than 95 percent of women and girls in the southern half of Mali, including Bambara, Soninke, Peul, Dogon, and Senoufo (2009). In 2014, the 28 Too Many Organization reported the highest rates of FGM in western and southern regions of Keyes, Skasso, Koulikoro, and Bamako and the lowest rates in the northeastern regions of Kidal and Gao.

It has been estimated that 94 percent of children in Mali have undergone FGM by the age of 4 years. A report by the Women's International Network News discovered widespread incidents of FGM in rural regions, where girls as young as 6 months to 6 years undergo the procedure. In 2014, 28 Too Many found the prevalence of FGM in girls aged infant to 14 at 69.2 percent. Similarly, the Office of Senior Coordinator for International Women's Issues found 37 percent of girls were circumcised before they reached school age (2009). Research studies continue to consistently demonstrate that FGM is a widespread and dangerous procedure. An article by Equality Now on FGM in Mali examined 1,980 girls and discovered 1,027 had undergone FGM, and 1.2 percent had been treated for FGM-related complications. Moreover, more than 1,116 girls and women had received medical care for FGM-related complications during this same period (Equality Now 2015). Fifty-two percent of women had experienced complications from FGM, including hemorrhage, and 34 percent of maternal deaths were related to hemorrhage from FGM (28 Too Many 2014).

The UN General Assembly adopted a resolution to eliminate FGM on December 21, 2012, but Malian women and girls are still subjected to this harmful procedure. In 2014, the Mali government set goals to bring FGM down from 69 percent to 64 percent for girls infant to 14 years, to ensure 95 percent of identified cases receive support, and to adopt policies to outlaw and criminalize FGM. Despite immense

challenges, Mali has great potential to outlaw this dangerous procedure, but for now, the fight to eradicate FGM continues. As reported by 28 Too Many, FGM is not unique to Mali; nearly 130 million women and girls worldwide have been subjected to this procedure (2014).

Employment

Women make up over half of the population in Mali, but they are less likely to enter the labor market and secure wage-paying positions or equivalent jobs to men. One report shows that Malian women's participation in the labor market is widespread in informal sectors and limited in the formal sectors. Approximately 48.4 percent of women are employed in agricultural sectors, where they perform hard labor; yet, women in rural regions live in abject poverty. The report further speculates that this can perhaps be explained by the fact that women employment is not highly regarded; consequently, women are relegated into the informal sectors. Additional education for women, however, does not translate into formal employment due to systematic institutional discrimination (Doumbia and Meurs 1998).

Malian women are disproportionately underrepresented in the paid labor market. As observed by the Millennium Development Goals, a high proportion of women in Mali worked in the informal sector: 84.7 percent in 2004 and 88 percent in 2007. Furthermore, women accounted for only 11.4 percent in the nonagricultural industries, but this number decreased to 3.6 percent in 2007 (UNDP 2017). The Social Institution & Gender Index (SIGI) found 52 percent of females of working age were part of the labor force in 2013, compared to 82 percent of their male counterparts (2014). Most troubling, in 2013, women represented 39 percent of the total labor force. As affirmed by the Permanent Household Survey, women's participation in the labor force in Mali was 75.7 percent, as opposed to 85.8 percent for men (UNDP 2017). The survey also indicates that although 51 percent of jobs were held by women, only 3.6 percent of these women earned wages, and the rest were self-employed.

Studies show that women with the same educational levels as men are less likely to secure wage-paying jobs and more likely to be paid less than men (Doumbia and Meurs 2003). Similarly, another study found that one year of additional education for females increases the chances of access to a high-quality job by about 1 percent; however, one year of additional education has twice that effect

for males (Kuepie, Dzossa, and Kelodjoue 2013). A survey conducted in Mali by the Employment and Training Observatory in the occupational category by sex indicates that women are overwhelming overrepresented in lower-paying positions and underrepresented in managerial and executive levels. In apprenticeships, women's participation is 43 percent, compared to 56.8 percent for men, and women held 19.2 percent of management positions and 16.4 percent of senior-level positions. Women occupied only 23.5 percent of junior executive levels. Furthermore, women accounted for only one-quarter of civil servants. An analysis of the employment sector and gender in Mali revealed similar results of women's underrepresentation in executive-level positions, including public administrations (CIA 2016).

Women in Mali are significantly less likely to hold positions with greater education requirements. For the senior executive positions, which require a master's degree or higher, women held 10.2 percent. For the junior executive level, which requires a postsecondary technical degree or equivalent qualification, there were 38.8 percent women. In category B1, which requires a diploma in technical discipline or equivalent qualification, women occupied 22.1 percent. In category C, which is equivalent to the level for a skilled worker (vocational training certificate), women occupied 36.2 percent. Finally, in category D, which consists of civil servants without any qualifications, women were in 35.3 percent of the jobs (CIA 2016).

The results of the survey highlight severe discrepancies between women and men employed in civil service. Because gender has a pronounced effect on human capital in Mali, educated women are relegated into low-wage positions. It is not surprising, therefore, that women continue to face inequality in the labor market and remain among the poorest population in the country. While some efforts have resulted in some improvements, thousands of Malian women still face obstacles in securing wage employment and leadership positions. The fight for equality for Malian women is more of a dream than a reality.

Family Life

Marriage

In Mali, child and forced marriages for girls are deeply rooted in tradition and the gender inequality and poverty that have existed for many centuries. Child marriage makes girls vulnerable to domestic violence and affects all aspect of their lives, including denying them the right

to their childhood and education. Researchers argue that child marriage is a form of sexual violence that is widespread in Mali. According to the SIGI, Mali has one of the worst records for child marriages in the world, and it is ranked 15th out of the 20 countries with the highest prevalence of child marriage (CIA 2016). As stipulated in the 2011 Family Code, a husband is the head of family; therefore, he has sole family and parental rights. Society expects a woman to adhere to the characteristics of a good wife by being submissive, faithful, and responsible for managing domestic life, including child care.

The marriage code is discriminatory in most aspects of family life and encourages marital inequality. For example, according to the Family Code, the legal age of marriage for girls is 15 years and 18 years for boys. Women and men in Mali are free to marry whom they want to marry; nonetheless, girls are allowed to marry before the age of 15 with parental consent and judicial authorization (CIA 2016). Forced marriages are illegal in Mali and punishable by 1–5 years of imprisonment or up to 20 years' imprisonment with 10 years' hard labor if the girl is under the age of 15; yet, forced marriages are rampant because the laws are not enforced.

Other discriminatory provisions in Malian legislation limit women's rights to decisions that affect their lives. For instance, women have no choice between a polygamous and a monogamous marriage, whether or not to work, or the choice of residence; rather, these decisions are left to the husband. The UNDP found that one out of every two women were married before the age of 16.5 years, while half of the men were married at the age of 26.1 years (UNDP 2017). Numerous studies have documented high levels of early marriages for Malian girls. Human Rights Watch (HRW) found that 22 percent of girls were married at the age of 15 and 93 percent before the age of 22, and 52.6 percent of girls aged 15–19 years were married, divorced, or widowed (2015). The Population Council revealed that 39 percent of girls aged 20–24 in Kayes were married before the age of 15, and 83 percent before the age of 18 (2006). Forced marriage is prevalent in some ethnic groups, including Foulani Kiriabe, Diaguinde and Kayes. Moreover, an article published by the Integrated Regional Information Networks (IRIN) indicated that early marriages are pervasive in Kayes, with the majority of girls 13–14 years old taken out of school to be married (2005).

According to the 2011 Marriage Code and the teaching of Islam, polygamy is legal and widespread in Mali; thus, women have limited legal protection. CEDAW found

almost 40 percent of women were in a polygamous union, including 20 percent of married girls aged 15–19 (2017). Other researchers have consistently demonstrated that illiterate women are twice as likely to be in polygamous unions as compared to women with education. Forty-four percent of women in polygamous unions had no education compared to 39 percent of women with primary education and 26 percent of women with secondary or higher education (DHS 2015). Polygamy was more prevalent in rural regions than in urban centers, with 45 percent of women in rural areas in polygamous unions in contrast to 34 percent of their female counterparts in urban regions (DHS 2015).

Other discriminatory practices limit a woman's right in inheritance; for instance, the sharia law postulates that both female and male surviving spouses have equal inheritance rights to property, including sons and daughters, yet daughters inherit poorer-quality land and receive half the share received by sons. Also noteworthy is that, under customary law, a wife is required to marry the brother of the deceased spouse, who also inherits all of the estate and custody of the children. In 2015, Mali launched a national campaign titled "Education for girls" to eradicate early child marriages. But the fight to save Malian girls is far from over.

Politics

Studies show that Mali has no restrictions on voting, but traditional perceptions of women as inferior to men prevail because the society upholds cultural practices that foster subordination of women. Thus, women have rare access to the public sphere and are underrepresented in a political system that remains a male domain. Consequently, these inequalities stand in the way of women's political development, thereby limiting their progress in the society. Mali created the Ministry of Women in 1997, but it does not effectively protect women's rights because it has limited legal protection. Furthermore, Article 2 of the 1992 Malian Constitution stipulates equality between women and men and prohibits discrimination based on gender; yet, discrimination against women in the Malian political system is endemic.

Despite global recognition of women's role in politics, Malian women's participation in the political process still plays a minimal role within decision-making bodies. Fewer than 10 percent of all elected officials, including ministers, general secretaries, and administrative directors, are

women (HRW 2015). The majority of decision-making positions in public service are occupied by men (OECD 2013). The National Democratic Institute (NDI) reported the following findings: women occupied 3 seats out of 129 in the National Assembly in 1992; 18 seats out of 147 in 1997; 15 seats out of 147 in 2002; and 15 out of 147 seats in 2007 (2016). Among mayoral corps, women held 7 out of 703 seats and, in 2013, only 14 out of 147 members elected to the National Assembly.

Most troubling is that among mayoral candidates in 2008, only 7 women were elected compared to 696 men. The following year, women gained one more mayoral position. Moreover, women were underrepresented in ministerial appointed posts, occupying 7 seats, while men held 20 seats in 2008. Nevertheless, the number of women holding ministerial seats increased slightly in 2009 to 8, while men occupied 23 seats. Sadly, out of 7 appointed members to the Supreme Court in 2008 and 2009, a woman held only one seat. Moreover, the UNDP reported that over 62 percent of the women employed by the public administration service were civil servants, but this number represents only 25 percent of the total number of civil servants and 17 percent of the total public service staff (2017). The underrepresentation signifies the barriers to political participation that women continue to experience. A few women have managed to climb the ladder to hold government ministerial posts and seats in the National Assembly; yet, women are largely absent from leadership and decision-making positions.

Religious and Cultural Roles

Mali is a predominantly Muslim nation. It has a history of being tolerant of a variety of religions and ways of practicing, but radical Islamic groups have increasingly contributed to unrest in the country. The aforementioned levels of illiteracy mean that not many people can read the Koran, and so they rely on others to interpret it for them. This often leads to the continued inequity of opportunity for women when leaders use religious texts to support ideas about women's subordination in family and society.

Issues

Violence

Violence against women is one of the most persistent and socially tolerated human rights violations in the world that has been ignored for many centuries. The UN Committee

on the Elimination of Discrimination Against Women has clearly stated that gender-based violence is a form of discrimination that inhibits women's ability to enjoy their rights and freedom on a basis of equality with men. Violence toward women in Mali, as it is globally, is a consequence of pervasive social systems that treat women as inferior because of their gender. In Malian society, gender-based violence (GBV), such as rape, sexual abuse, domestic violence, female genital mutilation, and early and forced marriages, exists on an unimaginable scale, and women encounter discriminatory obstacles in their efforts to access the justice system. Sadly, but not surprisingly, domestic violence, such as a husband beating a wife, is accepted and considered justified.

In 2001, Mali amended its penal code, but it did not include special provisions to outlaw domestic violence, thereby creating a legal vacuum in the law. Furthermore, domestic violence is not addressed in the *State Party Report* submitted by Mali, contrary to the request in general comment 28, paragraph 11, of the Human Rights Committee. Consequently, domestic violence continues to be endemic and accepted as a part of daily life. Violence affects women disproportionately and includes acts that inflict physical, mental, and sexual harm or suffering; threats; coercion; and other deprivations of liberty (CEDAW 2004). Violence violates, impairs, and prevents women and girls from enjoying their fundamental human rights and freedoms.

While researchers agree that gender-based violence is pervasive in Mali, women and girls have little access to the criminal justice system. Societal acceptance and tolerance of gender-based violence and lack of legislation and policies encourages the abuse and discourages the victims from reporting the crimes. Consequently, there is a large reservoir of underreported cases of gender-based violence; hence, statistics of this crime are underestimated and do not reveal the scope and severity of the problem.

Violence against women is a crime that occurs in many settings; however, much of it takes place at home, and the abuser could be a spouse, boyfriend, or an acquaintance. Studies have reported that violence in Mali affects many women, and the rate of pervasiveness of intimate partner violence is extremely high. The U.S. Agency for International Development (USAID 2014) reported alarming rates of violence against women from the age of 15, with nearly 4 in 10 women having been physically abused at home. Even more troubling, 65 percent of the incidents were inflicted by the husband, 20 percent by the mother or father of the mother, 14 percent by the father or husband

of the mother, and 15 percent by a sibling (USAID 2014). These statistics confirm that hundreds of Malian women continue to be violated in their homes. Sixty percent of Malian women who are not educated agreed that men are justified in beating their wives (CIA 2016).

Women in conflict-affected regions are more vulnerable to rape and other gender-related violence. For instance, during the 2012–2013 conflict in northern Mali, thousands of women and girls were violated, including rape, forced marriages, and other forms of violence.

Morocco

Overview of Morocco

Maroc, commonly called "Morocco" in Western English-speaking countries, hosts a population of roughly 32.9 million people who live within approximately 172,000 square miles (446,550 sq. km) on the northwestern portion of the African continent (High Commissioner of Planning 2010). Geographically, Morocco sits adjacent to the Atlantic Ocean to the west and the Mediterranean Sea to the north (CIA 2014). The nation of West Sahara borders the south, and Algeria forms nearly the entire eastern border. The border with Algeria closed in 1994, and the nations have since maintained only minimal diplomatic relations. The country's development of natural resources includes generalized prairie agriculture and fishing; mineral deposits such as iron, manganese, and lead; and a strong tourism industry due to its proximity to the Mediterranean. The majority of the country's labor force (44.6%) holds employment in some form of rural

agricultural production, mostly privatized; 19.8 percent of the population works in other facets of industry, and 35.5 percent in various public and private service jobs. As of 2012, the unemployment rate held steady at 9.5 percent.

Following its 1955 independence from rule by France as a colonial protectorate, Morocco reorganized into a constitutional monarchy in 1957. At present, King Mohammed VI (1963–) reigns over a substantially limited form of democratic government. The country ratified by accession the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) on June 21, 1993 (United Nations 2014).

The majority of the population identifies with Arab and Berber ancestry, and the primary languages spoken include Arabic, French, and Berber. Nearly 99 percent of the population identifies as Sunni Muslim, with less than 0.1 percent Shia Muslim. The remaining 1 percent of religious affiliations predominantly includes Jewish, Baha'i, and Christian faiths (United Nations 2014).

Girls and Teens

Education

Children usually begin primary school education around age 6, and the academic year runs from September through June. School classifications follow age ranges. Children ages 6–11 attend primary school, lower secondary school serves children ages 12–14 years, and ages 15–17 years attend upper secondary school (EPDC 2014). Multilingual education poses a challenge to continuing education in that students learn Arabic in primary and secondary schools, but university education is predominantly conducted in French.

On average, children spend 11 years in primary, secondary, and tertiary schooling, of which females spend 11 years and males spend 12 years on average. Literacy among youths aged 15–24 varies by sex, with a rate of 74 percent among females and 88.8 percent for males (UNICEF 2014). Throughout Morocco, many women have come to consider educational opportunities pivotal to fostering social and political equity. Beginning in the 1980s, traditionally rigid gender roles began to degrade due to changes in areas of law and cultural commitments (UNICEF 2014). As long-standing conservative and patriarchal sentiments have faded, opportunities for access to education have substantially improved, though this remains true mostly for women from wealthier classes. Compared to women living in and around urban areas, women in rural areas and those from poorer classes rarely

have access to advanced educational opportunities. Socioeconomic factors help to mitigate disadvantages among women in some cases, as family wealth permits access to university education.

Morocco hosts 23 universities—15 public and 8 private (Classbase 2014). Smaller educational institutes number around 221. Major universities reside in and around large urban centers, such as Marrakech, Fes, and Rabat. A historical matter of great pride for many Moroccans, the city of Fes claims the oldest university in the world, the University of al-Karaouine, or al-Qarawiyyin. Fatima al-Fihri (?–880 CE), a woman from a wealthy family, founded the institution in 859 CE. It has remained in continuous operation ever since, though the intellectual programs have changed over the centuries. At present, the curriculum primarily focuses on law, linguistics, and the study of Islam consistent with the teachings of a modern madrasa (educational institution) affiliated with the religion. Notably, at this point, males comprise the entire student population.

Between 2006 and 2012, roughly 4.7 percent of the total population graduated from tertiary educational institutions (universities or specialized institutes granting advanced degrees), of whom 4.2 percent are female and 5.3 percent are male. Those enrolled in postsecondary vocational and technical degree programs comprise 11.6–12 percent of the total population, within which roughly 9.7 percent are females and 13.6 percent males (UNESCO 2014).

At present, two leading problems confront women pursuing educational opportunities in Morocco: illiteracy among women in rural areas and generalized discrimination against women throughout the educational system overall. Problematic factors include familial and societal demands to contribute to domestic duties, long commutes between homes and schools, pressure on women to pursue work as “unskilled” labor (i.e., labor derived from skill sets learned outside of domestic settings), less prestigious opportunities as compared with men, and higher dropout rates. Governmental budget reductions in social services and education affect women detrimentally and substantially as compared with men. With nearly 50 percent of the population living in rural regions, older illiterate men from wealthier classes retain influence on governmental and social institutions, but older illiterate women from the same classes have little influence. Consequently, education as a means of improved equity among future generations remains limited, as many young, poor, rural women struggle to access education in a system preferential to and dominated by the interests of men (El Baggari 2013).

Health

Morocco’s centralized health care system is financed by the National Social Security Fund and administered by the National Sickness Insurance Agency. Overall, access to health care remains limited for most of the population because of the limited number of health care facilities that are, by and large, poorly maintained and understaffed by qualified professionals. Recent estimates show a disparity between roughly 24,000 available beds in care facilities and around 6 million patients seeking treatment (Library of Congress 2006). The average life expectancy among adults in 2012 was age 70.7, 72.5 for females and 68.9 for males (World Bank 2014). The overall infant mortality rate was 24.52 deaths per 1,000 live births (CIA 2014). By sex, the rates vary at 19.87 deaths per 1,000 births for females and 28.96 deaths per 1,000 births for males.

At present, among the estimated 30,000 overall population of HIV-infected individuals, around 11,000 women live with HIV (UNICEF 2014). As of 2013, 52 percent of new HIV infections in Morocco occur in women, 71 percent of these from infected spouses (Mumtaz et al. 2013). Among every 100,000 deaths, roughly 90.5 are men who die of cancer, and 74.5 are women who die of cancer. The most prevalent types of cancer afflicting women include breast cancer (39%) and cervical cancer (12%) (*Morocco World News* 2013). Use of tobacco is far less common among women (2%) than men (33%) (WHO 2011).

On the basis of Western medical standards, such as body mass index (BMI), obesity among Moroccan women is around 23 percent of the female population compared with 11 percent of males nationwide (WHO 2013). However, this may only apply to middle- and upper-class women. No identical reference to obesity seems relevant to all women as a familiar cultural construct. Rather, assessments of body image vary in regard to complexities of class, religious belief, tradition, region, and other factors.

Maternal Health

Women can find contraception options such as birth control pills, injections, diaphragms, IUDs, jelly, condoms, and sterilization widely available in cities, but there is less availability in rural areas. Predictably, contraception availability and use correlates with increased wealth and level of formal education. To obtain emergency contraceptives remains difficult for many. The nation’s Ministry of Health has coordinated national programs regarding family planning, the use of contraceptives, and mobile services for

maternal health and infant care. Approximately 1.5 midwives, nurses, and doctors per 1,000 people provide services in Morocco, and roughly 63 percent of births have an attending skilled professional (UNFPA 2011).

Data compiled in 2011 shows a range of countrywide childbirth circumstances that vary by locations, practices, and attendance by professionals with skilled clinical training. Skilled personnel attend 30 percent of births among the poorest 20 percent of the population, 70 percent of the births in the middle 20 percent of the population, and 95 percent of births in the wealthiest 20 percent. Prenatal and antenatal care is received by 40 percent of the poorest one-fifth, 71 percent of the middle one-fifth, and 93 percent of the wealthiest one-fifth. Home births occur at a rate of 5 percent among the wealthiest 20 percent, 32 percent among the middle 20 percent, and 71 percent among the poorest 20 percent of the population (Abdesslam 2011). Women have legalized access to abortion only when terminating a pregnancy will save the woman's life or to prevent permanent damage to physical or mental health. The law does not permit abortion of pregnancies resulting from rape or incest, nor for reasons related to fetal development.

Despite social stigmas, increasing numbers of young women do engage in premarital sex. This may indicate some gains in women's liberation and equity. However, with minimal access to educational resources regarding family planning, practices of unprotected sex and other high-risk nonintercourse sexual activities pose detrimental consequences for women in terms of sexually transmitted diseases and infections and unexpected and unplanned pregnancies. In 2011, an estimated 50,000 young women gave birth, and 12 percent of young women aged 15–24 have had an unplanned pregnancy (UNFPA 2013). Adolescent pregnancy rates garner intense stigma.

Employment

Women have a substantial role in the Moroccan economy as major contributors to most sectors of labor, service, and industry. Despite historical exclusion, in recent decades, women have made advancements in professional and government roles in the public, nonprofit, and private sectors. Consistent with patterns in other countries, the entry of women into employment sectors following exclusion has led to patterns of exploitation of women's labor, lowered pay when women gain representation, and disparities in protections through employment law. The expansion of neoliberal economic practices, instigated in large part by the influence

of Western, industrialized nations engaging in global development strategies, have caused concern about the treatment of women in Morocco's workforce. Some even contend that a stricter adherence to traditional Islamic practices offers better protections for women than the opportunities offered through capitalist economic development. Moroccan women face a substantial challenge given the dominant options requiring either adherence to conservative religious practices in the service of local patriarchies or subscribing to globalized economic systems designed around patriarchal norms exported by industrialized nations.

Morocco has ratified the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) and has adopted the UN Millennium Development Goals. Even with progressive moves in policy, female participation in the labor market declined from 30 percent in 1999 to 25 percent in 2012. Among those eligible to work, unemployment rates in recent years reflect a consistent disparity of 11 percent unemployment among males and 21 percent among females. On the Gender Inequality Index (GII), Morocco ranks 128th of 135 nations worldwide. Within the region, the nation ranks 12th out of 15 among the countries in the Middle East and North Africa (MENA) region (Achy 2013).

In types of employment, women mostly occupy roles in health, education, and lower-level services, with some recent gains in judicial and legislative professions. Women represent only around 13 percent of senior governance and public administrative roles (Achy 2013). Some estimates indicate substantial pay disparities, with women earning 17–25 percent less than men, depending on the type of employment (Sadiqi 2003, 195). Women face greater difficulties overcoming unemployment, a problem compounded by the fact that employers show discriminatory preferences for men when hiring for seasonal and noncontinuous employment.

Since at least the 1990s, women's advocacy groups have sought to establish laws protecting against sexual harassment in the workplace. While Article 503 of the Moroccan Penal Code identifies physical sexual harassment as a punishable crime, this has yet to result in practices that provide actual redress against workplace harassment. Evidence indicates that workplace, acquaintance, stranger, and public sexual harassment remain common problems such that few women bring forward official claims out of fear of retaliation.

National law makes a provision for maternity and paternity leave. Women can claim leave with pay at 100 percent

of their wages for a duration of 14 weeks and an additional year of leave without pay. Men can claim 100 percent of their wages for three days of paternity leave. This policy most likely benefits women working in middle- and upper-class professional and service-sector jobs, whereas women paid through informal and undocumented payments in cash likely have no recourse to make use of these provisions.

Family Life

The recent history of domestic slavery in Morocco helps set the context for understanding contemporary domestic labor conditions for women. The practice colluded with centuries of colonial slave trade controlled by European nations. Moreover, the selection of domestic slaves included a modern racial Manichaeism (“black” = “bad” = “inferior” plus “white” = “good” = “superior”). As a result, the majority of domestic slaves were black, typically West African females. Even though the French government had technically condemned slavery far earlier in the 20th century, the colonial protectorate government overseeing Morocco widely ignored or overlooked the matter. Many wealthy families kept women as domestic slaves until the mid-20th century, around the time Morocco established independence from France in 1956.

Marriage, age, and socioeconomic status influence women’s domestic labor roles. Married women face strong familial and social pressures to have children and adopt mothering roles that include preparing and cooking food, laundry, cleaning, child-rearing, and seeing to preparations for religious rituals. Age influences assignment of more energy-exerting tasks, such as cleaning to younger women while older women contribute to child care and more sedentary activities. Families with greater surplus wealth frequently employ maids and other domestic servants, transferring the domestic labor demands from women members of the family to hired labor, likely women as well. Given the sex-segregated conditions within many Moroccan homes, women serving in primarily domestic labor roles may have less access to quality food as compared with men who share the same household but who labor outside the home. Obesity rates are higher among women in domestic labor roles than among men of the same households working in public and for-profit labor settings, leading to speculation about the influences of domestic labor on women’s long-term health.

In 2004, Morocco adopted a new Family Code granting women equal legal rights within the family that provides

reciprocal rights for heterosexual married couples in terms of child-rearing, family planning, cohabitation, and other domestic concerns. The 2004 law provides women and men the same legal basis to initiate divorce proceedings, whereas previously men could unilaterally “repudiate” their wives, divorcing them without contest. However, pursuant to Islamic traditions, couples must participate in a court-mandated reconciliation process prior to any further pursuit of divorce. Women now retain primary custody of children by default, countering the prior law that required women to forfeit custody as a condition of divorce. Current marriage law also regulates polygamy in that men seeking to marry more than one woman must provide financial records to a judge demonstrating the ability to support multiple marriages, and men must attest to their intent to treat spouses equally. Gender roles within family divisions of labor and decision making remain relatively unchanged for married couples throughout most of the country, even in light of the changes in social policy.

Since 1962, Moroccan law has criminalized consensual sex between people identified as the same sex (ILGA 2014). Because administrative institutions consider it illegal to identify as lesbian, gay, bisexual, or transgender orientation, little to no government data provides a clear picture of concerns related to sexuality and gender identity (U.S. Department of State 2011). Punishments under these laws include financial penalties and prison time of up to 10 years. In some cases, individuals or groups target lesbians and gay men for violence and even honor killings, possibly including collusion with and participation by police.

Some girls and adolescent women endure forced child marriage. The state regulates child marriage, declaring age 18 the legal age of consensual marriage, but a substantial number of families, 11 percent of marriages in 2011, obtain court authorizations for girls under the age of 18 to marry (Kugle 2010). Various domestic and international organizations now advocate against child marriages.

Politics

As recently as 2011, organized activism, including prodemocracy protests and demonstrations, pressured Morocco’s ruler and government to introduce a new constitution with expanded citizen powers and increased electoral influence, particularly in local elections, though the king retains monarchical authority. Many consider February 20, 2011, the first day of massive demonstrations in Morocco inspired by other protests in the region, a decisive turn in

women's movements and overall movements for democracy, and some continue to refer to the current period of ongoing political change as a result of the "February 20th Movement."

Despite progress in social discourse about increasing citizen participation in governance, the country remains under scrutiny by international watchdog organizations for suppression of free broadcast media, particularly through state-sanctioned persecution and imprisonment of journalists. The turn toward more open democratic elections has technically opened opportunities for women to hold public office, but the primarily male-dominated realm of politics has only marginally changed, with conservative and regressive parties retaining a strong hold on national politics. The most widely documented and active women's movements in Morocco reflect international influences of liberal feminism emergent in Western, industrialized nations. Arguably, however, various forms of feminism and women's political interests continue to develop, including Islamic feminisms that modify and challenge liberal political platforms.

The legal and juridical system draws on aspects of Islamic and French law, a hybrid system following generations of intercultural blending of Islam with French colonial influences. Legislative acts remain subject to review by the Supreme Court, but with ultimate deference to the monarch. Citizens have a right to a fair trial under the legal system that grants presumption of innocence. However, the system does not use juries and predominantly relies on attorneys as arbiters of legal claims. Judges who preside over criminal and civil trials have training in sharia law as well as the Napoleonic tradition originating with French colonial influence.

Morocco implemented a quota system in 2002 that led to a boon in women's participation in elected government, particularly in the national parliamentary system. The previously male-dominated political system has slowly adjusted, and the fact of women's presence in such roles does not necessarily translate into widespread change; men still dominate political decision making in national representative governance. The effects of the 2002 legislation should not, however, be underestimated or overestimated. Women have held the right to vote and run for public office since 1962. Of the 17,174 persons who ran for political office in 1960, only 14 were women. In 1992, only 1,086 of the total 93,000 candidates were women. By 2003, the number of women candidates grew to 6,024 among a total of 122,658 candidates (Tahri 2003). Even with the

slow gain in women's representation in elected positions, a proliferation of women's political parties and pro-women advocacy groups continue following the 2002 law.

The heterogeneity of women in Morocco makes the accuracy of any generalized profile quite limited. Women enjoy various degrees of freedom as well as difficulty, depending on geography, class, economics, and traditions localized to different parts of the country. Within recent decades, women in urban and industrialized cities enjoy burgeoning participation in social and political aspects of Moroccan society. However, women in rural areas do not necessarily benefit from modern turns toward women's self-determination found in metropolitan areas.

As a result of the work of feminist organizations within and external to the country, women have gained substantial advancements in personal status law. Key issues facing women include discrimination based on sex and gender, underrepresentation or exclusion from policy making, illiteracy in some regions, poverty, and violence against women. Since the 1970s, feminist and women's organizations have made great advancements in reducing these and other problems, though many remain. However, the Moroccan government demonstrates overall weak commitments to the protection of women. Investigations, advocacy, and prosecution in the interests of protecting women from gender-based violence remain unreliable in most parts of the nation.

Labor laws do not explicitly protect against sexual harassment, nor do such laws make provisions for salary equity. Within recent years, these legal and political circumstances have led women to advocate for systematic equality, including quota-based representation in governance and political parties as well as strong encouragement for women to pursue appointments to government positions and election to public office. Some contend, however, that this appeal to conventional statist politics results in silencing the everyday "street politics" without which women's advancement in recent decades could not have occurred.

Religious and Cultural Roles

Visitors to Morocco's most popular tourist destinations, such as Tangiers, Marrakech, and Fez, may get a false impression of Moroccans as impersonal, *en masse*. Travel guides, for instance, profile public life in Morocco as rough, even profane, as compared with the relative tranquility of private home life. As with the centers of tourism

and trade in any country, much of the activity represents embellishments of Moroccan society. Cultural practices and norms among women vary widely throughout the country. Moreover, the growing base of women entrepreneurs contributes to changing social and cultural roles as women in middle and upper classes alter or reject conventional gender role assignment to unpaid domestic work and paid manual and service labor.

Because of the industrialized modernization of Morocco's major cities (Casablanca, Tangiers, Marrakech, Rabat, Fes), Moroccans in most areas of the country have access to some forms of media. An expansive state-run telecommunications network infrastructure continues to grow and expands the reach of global popular culture influences from industrialized European and North American nations into many parts of the country. In many ways, Moroccans interested in further industrialization and modernization refer to themselves culturally, economically, and politically as distinct from their geographical neighbors in the rest of Africa. Following the trend of industrialization in recent decades, technology use, including computers and cell phone use, is common among middle- and upper-class women. Most women in and near major cities and larger towns dress in clothing representative of European and American fashions. Women covering themselves, which is more common to other predominantly Muslim countries, is much rarer in Morocco, but it is quite frequent in rural areas and among older generations of women. Popular music, films, and other media follow the same trend as clothing and technology use. Films are a popular form of entertainment, and many cities and towns have modern theaters with digital equipment. Among the few films produced by Moroccan production firms, most are documentaries.

The combination of patriarchy, regressive interpretations of Islam, and widespread illiteracy among women have a silencing influence on most women in poorer and middle classes. Under these circumstances, men systematically relegate women to "listening" roles during religious ceremonies and cultural observances, except when women's labor proves useful for preparatory labors in advance of services. Arguably due to the influences of Berber cultures on dominant Islamic cultures, women maintain oral text traditions in which women's leadership and resistance continue to operate as a counterculture of persistence and endurance among patriarchal norms. Oral literature remembered and shared by generational chains of women functioned in defiance of colonialism for centuries, and

in the contemporary world, it even affords women some influence on the operations of male-dominated mosques. Women's oral texts have no official sanction or acknowledgment in Moroccan political and social institutions, and yet they comprise a substantial form of power whereby women use orality to bring changes through education, media, commerce, the arts, and other facets of life.

Issues

To understand the issues facing Moroccan women, it is important to take into account the intersecting complexities. These include poverty, illiteracy, limited access to health care, low levels of women's political representation in government, regressive religious and cultural practices, extremely limited economic mobility, and recent reforms to family law within the past two decades. The culmination of these factors has, despite recent formal progress in some aspects of public policy and economic redistribution, left women systematically subservient to men except where they can form practices of daily resistance. Women from wealthier classes, a minority who enjoy daily freedoms, education, and access to social services, find themselves uniquely poised to advocate for women in poorer classes. However, this also poses a burden by tethering solutions to women's problems within women as a class, thereby exempting men from the responsibilities and labors to assist with women's liberation.

Morocco recognizes rape as a criminal offense, but there is no specific provision against marital rape. Women endure discouragement from pursuing justice in response to sexual assault. Cultural mores labeling women as impure or unclean constrain women under norms that justify shaming and victim blaming. In particular, the obligation to protect family honor deters women from reporting and pursuing criminal charges against perpetrators. Those who do seek police intervention against unknown assailants and spouses face patriarchal conditions in law and criminal investigations requiring them to demonstrate evidence of abuses. If they are unable to garner police support, women who return to their domestic situations likely face additional violence out of retribution.

Legally, women who engage in extramarital sex face disproportionate burdens under a law that provides men with relaxed sentences for acts of violence toward women who are accused of adultery. Despite stereotypical profiling of predominantly Muslim countries in Western media, incidents of honor killings in Morocco are incredibly rare

as are practices of female genital cutting (FGC). When such incidents do occur, police continue to treat them as “family matters” of a type that does not warrant police intervention.

Trafficking and indentured exploitation of women pose a serious problem in Morocco. The country ranks high on a list of origin countries, low as a transit country, and very low as a destination country; Morocco is one of the main world sources of trafficked persons (Cullen-DuPont 2009, 239–244). Recent data primarily track trafficking into Spain, which likely serves as a transition country before traffickers move their captives to North America, the Caribbean, and South America. Various governmental and nongovernmental agencies have responded to attempt to mitigate the trade in women as sex slaves and indentured domestic workers.

Outlook for the 21st Century

Within the coming decades, Morocco may diminish affiliation with African, Arabic, and Mediterranean nations as the country engages in economic, cultural, and political shifts toward European interests. The pressure to sign on to the dominant interests of Western, industrialized nations may bring about overall prosperity in terms of the total financial holdings of the nation. However, the long-standing disparities between the poor and their wealthy, elite counterparts would perpetuate if not also exaggerate growing political unrest, even as the country aims to democratize, albeit slowly. Given that women comprise nearly 45 percent of the industrial laborers in the country, a strong contributing class, it seems an urgent need to expand their legal, economic, and political roles. In the coming century, Moroccan women may bring about domestic political advocacy movements in partnership with international NGOs (Tahri 2003). It remains questionable whether this will continue to advance narrow forms of liberal (and Western forms of) feminisms or help to proliferate feminisms unique to and, perhaps, more responsive to Moroccan women's interests. For a time, this may involve organizing women's caucuses within existing political parties and then perhaps expanding to develop organized coalitions with long-term interests in equity and shared rule.

N

Namibia

Overview of Country

The Republic of Namibia is geographically bordered by Angola and Zambia (north), South Africa (south), Botswana (east), and the Atlantic Ocean (west). It is divided into 13 ethnic regions, in which more than 30 native dialects are spoken, with English serving as the official national language. The ethnic composition of the country has 10 groups, including Ovambo (50%), Kavango (9%), Herero (7%), Damara (7%), Nama (5%), Caprivian (4%), San (3%), Baster (2%), Tswana (less than 1%), and white (6%). The population is just over 2.3 million people, 52 percent of whom are women, and approximately 24 percent of the country's inhabitants live below the international poverty line equivalent of USD\$1.25 per day (NationMaster 2014).

The country's primary occupation is agriculture, and its indigenous rural inhabitants work as farmers, herders, and hunter-gathers. Many urbanites live in the capital city of Windhoek, which has a population of just over 300,000. It is the site of the country's governmental, social, economic, educational, and cultural enterprises, and its ethnic mix is blacks (67%), whites (16%), and Basters (an ethnic group comprised of descendants of European settlers and indigenous women), Coloureds (a term for people of mixed race heritage that includes Basters), and Asians (17%). Many

city dwellers are employed as civil servants, traders, industrialists, and other professionals.

More than 90 percent of all Namibians have converted to Christianity, with Lutheran and Catholic being the predominate denominations. A small percentage of inhabitants have retained their tribal religious beliefs and adhere to the customary laws of their ancestors.

Colonial History

During the 19th century international law permitted European powers to claim sovereignty over *territorium nullius* (man's lands) inhabited by indigenous peoples, and in 1884, the Republic of Namibia became a German colonial protectorate known as a *Schutzgebiet*. After South Africa defeated the Germans during World War I, the colony, called *Südwestafrika* (South West Africa), was claimed and administered as a League of Nations mandate territory from 1919 until the United Nations was established in 1946. Apartheid was instituted in the 1960s. It dispossessed many indigenous people of their land and separated Namibians into self-governed homelands wherein borders were strictly controlled and mobility restricted.

These divisions repressed and confined the Namibian people, whose individual and collective protests and nationalist sentiments developed over several decades into the establishment of nationalist organizations. The most prominent of these was the South West Africa People's

Organization (SWAPO), whose powerful influence led the United Nations to acknowledge them as the singular representative of all Namibians. After a 25-year struggle, Namibia gained independence from South Africa on March 21, 1990, with SWAPO becoming the country's first democratically elected ruling party. Their efforts were instrumental in the reorganization of the 13 existing homelands into newly defined administrative regions. Although some residual effects of colonialism and apartheid have persisted in Namibia since independence, overall, the country has remained stable in its own right.

Education

Colonial rule caused deep divisions in educational access for Namibians, who had been driven into 11 ethnically specified "homelands" as part of apartheid. Following independence, national enrollment goals sought equitable educational access for both girls and boys, as reflected in the Namibian Constitution, Article 20: (1) "All persons shall have the right to education," and (2) "Primary education shall be compulsory and the State shall provide reasonable facilities to render effective this right for every resident within Namibia, by establishing and maintaining State schools at which primary education will be provided free of charge." Schools are designated as pre-primary (expanded from one to three years); lower primary (grades 1–4); upper primary (grades 5–7); junior secondary (grades 8–10); and senior secondary (grades 11–12). Although this compulsory education is free, parents must pay out-of-pocket costs for books, school uniforms, boarding, and sustained improvements to the schools (Tjipueja 2001, 2).

Approximately 600,000 girls and boys attend one of the more than 1,500 primary and secondary schools in Namibia. In general, national enrollment patterns appear on the surface to reflect educational equity, but regional variations reflect inequities by which many female learners have decreased access to educational opportunities. And however healthy the enrollment statistics, quality of education remains a challenge because of teacher shortages and the limited educational backgrounds of teachers for all grade levels, most of whom have had just three years of tertiary education beyond the 12th grade (Sasman 2011, 1).

As the country continues to develop, it faces many difficulties concerning educating youth, especially girls. As a recent empirical study on *Youth and Adult Learning and*

Education in Namibia observes, "Clear policy, financing and good governance are needed to ensure that young people and adults alike receive access to education—as is their right" (Shalyefu 2012, 4). Efforts are being made to address and find solutions for challenges, however, including those stemming from pandemic levels of teen pregnancies, which often result from poverty, limited exposure to sex education, lack of ambition, and a dearth of successful role models for young girls.

An estimated 1,500 pregnancy-related dropouts were reported in 2007, which prompted the minister of education to observe, "The need to address the issue of learner pregnancy is critical. Action is required from national, regional, and local levels. Together we must work together to ensure that our children, and our children's children, are able to receive the education they need and deserve" (Iyambo 2008, 1). Members of the Ministry of Education consulted with adult and child representatives from all 13 regions (urban and rural) to mobilize efforts in decreasing pregnancy rates and to develop opportunities for teen mothers to complete their educations. In 2008, they issued a revised *Education Sector Policy for the Prevention and Management of Learner Pregnancy* (2008), which stipulates that complementary efforts should be taken both at home and at school in the management and prevention of teen pregnancies. This policy requires schools to support, rather than stigmatize and penalize, pregnant girls. It also acknowledges a range of contributing factors to high pregnancy rates, including alcohol and drug abuse, poverty, and forced sexual encounters, rather than assuming young girls are merely engaging in risky sexual behavior.

Because of space limitations at vocational schools and universities, it is uncommon for Namibian youths to pursue higher education beyond secondary school. However, some young women do go on to attend the University of Namibia (of which 42% of the faculty are women), the Polytechnic of Namibia, the International University of Management, the Police College, or a teacher training college.

Health

Access to Health Care

Life expectancy in Namibia is 67 years; women live a few more years than men. Thirty-six percent of the population is under the age of 15, and 45 percent of the population lives in urban areas (WHO 2015).

Improved drinking water is available to 93.4 percent of the population (UNICEF 2006). Only 32.3 percent has

access to sanitation facilities, but a significant gap between urban access (57.1%) and rural (16.9%) exists (WHO 2015). Equity gaps continue to persist, especially in rural and remote areas.

Maternal Health

More than 55.1 percent of women in Namibia use some form of contraception. The fertility rate in 2013 was 3 per woman (WHO 2015). For a woman between the ages of 15–49, there is a 5 percent probability that she will become ill or die from maternal causes. The maternal mortality rate was 130 per 100,000 in 2013. This is better today than in past years, when it was 320 per 100,000 in 1990. Both the under-5 and maternal mortality rates are decreasing and lower than other countries in the region. More than 70 percent of women attend four or more antenatal appointments, and 81 percent are attended by a skilled birth assistant for delivery, though this ranges from 72.5 in rural areas to 93.9 in urban areas (UNICEF 2006). More than 80.8 percent of women give birth in a health care facility (UNICEF 2006). The mortality rate for children under five years old is 50/1,000 children, which is lower than the 74 per 1,000 in 1990 (WHO 2015). Prematurity is the leading cause of death for children under the age of five.

Abortion is illegal except in extreme cases of rape, incest, or endangerment of the mother's life. Two other medical practitioners must sign off on one of the allowable reasons for seeking an abortion, and they may not participate in the medical procedure. Abortions must be performed in a state-controlled institution. Namibian reports of fetuses in the sewer system are common. Expensive trips to South Africa to procure an abortion are only available to the wealthiest of women. When abortions are illegal or difficult to obtain, the numbers of abortions do not decline, there are just more unsafe abortions. "In 1997 the nation legalized abortion, and the same year the annual number of abortion-related deaths fell by 91 [percent]" (Kenyon 2014). Unsafe abortions are dangerous and can contribute to lasting health issues for women.

Diseases and Disorders

Namibia reports 82 percent of children receive the measles vaccine (WHO 2015). Malaria rates are very low, and nearly every home has an insecticide-treated net (ITN). Hypertension (or high blood pressure) is the most

common noncommunicable disease risk (38.1%), followed by diabetes (9.6%) (WHO 2015). The leading causes of death for women in 2013 are cardiovascular disease and diabetes, followed by AIDS.

HIV/AIDS

HIV is the leading cause of death in Namibia, with 25 percent of deaths listing HIV as the leading cause. In 2012, 582.9/100,000 people died from HIV (WHO 2015). As of 2012, 220,000 people in Namibia were living with HIV; 18,000 were children (UNICEF 2006). A staggering 76,000 children have been orphaned due to their parents dying from HIV/AIDS, compared to 54,000 children orphaned for other reasons (UNICEF 2006).

According to UNICEF, in 2012, there is a 13.3 percent prevalence rate of HIV. When looking at 2008–2012, we see additional differences between young women and men in comprehensive knowledge of HIV and condom use when having sex with multiple partners. More young women had comprehensive knowledge (62.2%, compared to young men's 58.5%), but more young men used condoms (82.2%, compared to 73.7% of young women). Studies have demonstrated that it is more difficult for women to negotiate using condoms, even in consensual relationships. There is also disparity between urban and rural and the richest and poorest people in the country. Young people living in urban areas or from the richest 20 percent of the population had higher rates of comprehensive knowledge about HIV than those from rural areas or from the poorest 20 percent (UNICEF 2006). In February 2017, a three-day consultation was held in Namibia to focus on increasing HIV prevention interventions with adolescent girls. Three-quarters of new HIV infections are girls aged 15–19. AIDS-related illness is the number one cause of death in women of reproductive age (WHO 2015). More than half of those infected are female, and at least 10 percent are teens between the ages of 15 and 24.

To help reduce the prevalence of this disease, a nationwide public health campaign was recently launched recommending adoption of the ABCs—an acronym for "Abstinence, Be faithful, use a Condom." This campaign should be particularly useful in educating teen girls on how to protect themselves from HIV transmission through abstinence, monogamy, and the use of condoms, while also informing them of stigmas associated with the disease and where to seek assistance from testing sites and health care centers.

Employment

The *Namibia Labour Force Survey 2013* indicates that both women and men in the country hold wage-earning jobs outside of the home in “factories, business enterprises, farms, shops, service undertakings, and other economic units engaged in production of goods and services intended for sale on the market,” as well as jobs in hotels, restaurants, transportation, communication, government, politics, social and cultural institutions, medical fields, the law, and other professions. Home-based jobs include agriculture, hunting, milling and other food processing, handicrafts, construction and major repairs, fetching water, and collecting wood.

Urban women in Namibia are primarily in wage-earning professions, while rural women engage in home-based work, income-generating ventures, and non-wage-earning activities. Typically, rural women are less literate and educated than their urban counterparts, who hold professional jobs, primarily located in Windhoek, in which they are subjected to lower pay, given less management responsibility, and are often employed in female-dominated fields such as teaching and nursing. Many women are employed as domestic workers by middle- and upper-class urbanites; they have protections afforded by the Namibian Labour Act as well as the Namibia Domestic and Allied Workers Union (NDAWU).

An influential organization is the Namibian Farm Workers Union (WFWU), which advocates for the rights of both women and men for improved working conditions. However, for many rural women, such improvements rarely solve the problem of their agricultural production not providing sufficient subsistence for their families. To offset the deficit, many women engage in entrepreneurial ventures, such as sewing, needlework, basket making, running bakeries, and brickmaking. Sometimes these activities are successful in bringing additional cash income into their households, but because the women lack adequate training in finance and management, they are rarely able to turn these enterprises into sustained revenue producing businesses.

Family Life

Among the various ethnic cultures in Namibia, family life differs across the 13 regions, but the Ovambos are representative of how family structure, governance, and daily life function in general. Much emphasis is placed on traditional Ovambo society because it has “a great impact

on women’s lives and is an important factor in defining women’s position” (Soiri 1996, 18). Located in northern Namibia, the Ovambos are composed of seven groups that have similar cultural characteristics, although they speak different dialects. The entire social system revolves around the chief, who governs in consultation with his councillors. Families reside in individual homesteads, or gumbos, with a husband, his wife (or wives if polygamous), and their children. Although the man is the head of the household, the culture is matrilineal, with mothers responsible for supporting the children. The culture is agricultural, and each gumbo has a plot of land on which goats, cattle, and pigs are raised and millet, watermelon, sorghum, beans, and squash are harvested. Although these homesteads are autonomous units, the culture is traditionally communal, so it is customary for neighboring gumbos to assist one another with agricultural work.

Precolonial Ovambo women were well respected as holders of the sociocultural values. They were considered mothers of the nation, the clan, and the family. Since independence, these women have retained much of their empowerment within their customary practices and tradition, and their familial presence contributes to the wholesome well-being of their households. As mothers, they played key roles in the formation of their children while also assisting their husbands in harvesting the land. Traditionally, women did not view themselves as inferior to males in precolonial Ovambo because they were so integral, influential, and respected for their roles in the success and survival of their society.

As previously mentioned, women’s familial roles in the Ovambo culture are similar to those of other Namibian cultures, such as the Kavango (matrilineal); Herero (patrilineal and matrilineal, or double descent); Damara (patrilineal); Nama (patrilineal); Caprivian (patrilineal); San (patrilineal); Baster (patrilineal); and Tswana (patrilineal). Among these various tribes, daily family life centers around the women; they keep all aspects of the household in good working order by caring for children, cleaning, working in the fields, and more. While holding strong and respected roles within their families, many of the women in Namibia’s 11 distinct ethnic groups do not perceive that patriarchal rule is deeply entrenched in their customary practices and traditions. It is probable that most also do not know that there is a constitution in place that both protects and enhances their rights.

The Namibian Constitution (1990) is rare in its use of gender-neutral language and espousal of gender equality,

with Article 10 stating, “(1) All persons are equal before the law; and (2) No person shall be discriminated against on the grounds of sex, race, color, ethnic origin, religion, creed or social or economic status.” While ideal in theory, in praxis, many ethnic cultures remain patriarchal, with the man as head of the household and the woman recognized as his property. While the legal status of women has improved since independence, prolonged traditions of oppression have resulted in lowered self-esteem and disempowerment for both rural and urban female Namibians, despite their improved constitutional rights.

In the tradition of both patrilineal and matrilineal customary marriage, the union between a man and woman is arranged between kinship groups. A *lobola* (or bride-price consisting of both money and heads of cattle) is paid, which bonds the two groups and gives the man and his kin controlling rights over the woman, who remains subordinate in the domestic sphere. Such arrangements infer that a woman is being purchased as a saleable commodity, but a *lobola* is intended to represent security for the marriage and as protection in the event of divorce. Typically, reasons for divorce in customary systems include barrenness, child neglect, adultery by the wife, witchcraft, and acute alcohol or drug abuse.

Customary systems prohibit women from owning and inheriting property, and rural women are dependent on their husbands for money. This keeps them vulnerable to inescapable cycles of poverty, domestic violence, and other forms of exploitation. Namibian women continue to be challenged by gender inequality regarding land and property ownership due to a lack of awareness of their legal rights, prejudicial property laws, and discriminatory practices. While a wife's property ownership may be contingent upon the goodwill of her husband in the event of divorce, her rights in terms of provisions for her children are covered by the Maintenance Act (2003). This act ensures that both parents are equally responsible for supporting their children, and it is applicable even in customary systems that might otherwise not hold both parents responsible for child maintenance.

Sexuality and LGBT

While the majority of Namibians are heterosexual, there is an LGBT community that struggles for recognition and human and equal rights. At present, same-sex relationships are permissible between females; however, because the tradition of Roman-Dutch common law that has

remained in effect since independence, “sodomy” and “unnatural sexual offences” are criminal offenses between men. Advocates for repeal of this law believe that maintenance of these laws perpetuates homophobia against the LGBT community and inhibits the cultivation of tolerance, respect, and inclusivity.

Perhaps the leading advocate for LGBT rights is Sister Namibia, the pioneering feminist organization founded in 1989, one year prior to independence. Its sociopolitical agenda is all-inclusive in its promotion of women's human rights and gender equality in a world free from oppression, discrimination, and violence. In the late 1990s, Sister Namibia developed its 50/50 Campaign for Women's Political Empowerment as an outgrowth of the Namibian Women's Manifesto, and its efforts to be inclusive of lesbian rights caused the SWAPO party to withdraw support. Formal LGBT organizing surfaced in direct response to SWAPO's homophobia, and Sister Namibia garnered support from government leaders and ruling party members on the local, regional, and national levels that was instrumental in the retention of lesbian rights representation in the revised Namibian Women's Manifesto of 2004. In its proactivity, Sister Namibia developed the Rainbow Project (TRP) in 1997, and it also has a Lesbian Support Programme. Both programs defend the rights of LGBT members throughout the country. Overall, the good work of this organization strives indefatigably for gender equality and rights for lesbians and gays while stewarding a new generation of outspoken lesbian women.

Two women who have been highly influential in LGBT rights are Liz Frank and Elizabeth /Khaxas. Both are former directors of Sister Namibia and have held leadership roles within the Coalition of African Lesbians (CAL), an activist group that aims to achieve equality for all African lesbians by

[advocating and] lobbying for the political, legal, economic, cultural and sexual rights of African lesbians; engaging strategically with African and international structures and allies; building and strengthening the voice and visibility of African lesbians through research, media and cultural activities, and through participation in local and international forums; building a strong and sustainable lesbian coalition supporting the development of national organizations working on lesbian issues; building a strong and sustainable lesbian coalition, [and more]. (Frank and / Khaxas 2006, 85)

Finally, the Global Equality Fund through the U.S. Department of State issues an annual *Human Rights Report* that catalogs the ongoing range of abuses and discriminatory treatment directed at LGBT community members worldwide. The section on “Sexual Orientation/Gender Identity References” notes that politicians typically reflect opposition to legislation that would protect the rights of LGBT persons. An organization known as OutRight Namibia, which advocates for the rights of the LGBT community, finds that victims are often ridiculed and not taken seriously when complaints are registered with the local law enforcement (U.S. Department of State 2013). This causes many abuses to go unreported, including incidents of “corrective rape” perpetrated against lesbians as a means of “reversing” their sexual preferences.

Politics

The Parliament of Namibia is a bicameral legislative body with a lower and an upper chamber. Laws are initiated and approved in the lower chamber, or National Assembly, which is composed of 78 members (6 appointed by the president, and 72 selected through parliamentary election). The upper chamber, or National Council, serves in an advisory capacity to the National Assembly regarding changes to subordinate laws stemming from laws enacted by the lower chamber. Each of the 13 ethnic regions elects two representatives who serve regional councils in the upper chamber. All members of the cabinet are members of the lower house.

Ten years following Namibia’s independence, the New York City–based Women’s Environment and Development Organization (WEDO) launched the 50/50 Campaign to raise women’s global participation in politics and decision making. Namibia was one of several African countries to establish a national 50/50 Campaign, one that developed strategies for getting women elected to Parliament. Many women had participated in nationalist struggles to end colonial rule, and they wanted to ensure that women’s concerns were addressed in the legislature while enhancing the democratic process in rural as well as urban areas by increasing gender diversity. This, combined with the fact that women had been granted suffrage in 1989, made it possible for women to engage in serious strategies to put women in office. As political leaders, women would be able to bridge gender gaps, represent women’s specific issues as they pertain to justice and gender equality, and also serve as role models for other women.

By 2004, approximately 43 percent of Namibia’s local mayors, deputy mayors, and councillors in villages and towns were women, and when the fifth National Assembly took office in 2005, a large number of women were elected as members of Parliament (MPs), including a woman deputy prime minister, 4 (out of 20) women deputy ministers, and 5 (out of 27) women ministers. While still outnumbered by men in Parliament, women MPs over the years have been legislatively successful in contributing to the constitution, securing the adoption of gender quotas for local elections, eliminating discriminatory legislation stemming from apartheid, enacting legislation centered on the socio-economic development of girls and women, and more.

Statistical information from the Inter-Parliamentary Union (2014) indicates that the country currently ranks 51st out of 189 countries worldwide in its percentage of women holding office in parliament. In the lower house election held in November 2009, out of a total of 78 seats, 20 women were elected (averaging 26%). In the upper house election held in November 2010, out of 26 seats, 7 women were elected (averaging 27%). While representing a degree of success toward achieving gender equality in Namibian politics, these statistics reflect that there are challenges still to be overcome. Some of these are due to residual divisions stemming from the country’s colonial history as well as pervasive ethnic, racial, and geographical differences that continue to divide the country.

As women continue to gain momentum within the Namibian politics, it has become evident that relations are strained between women activists seeking gender equality and women politicians who are faced with the challenges of navigating a traditionally male-dominated political realm in a patriarchal country. On the positive side, among sub-Saharan African countries, Namibia’s women’s organizations are recognized as highly influential in pressuring political parties to include more female candidates as well as encouraging and providing training for prospective women candidates to stand for parliamentary seats.

In addition to Parliament, women also hold leadership roles in the Namibian cabinet. Thus far, the highest representation of women cabinet members was 27 percent in 2006 (which represented a 14% increase from 2000). More recently, in 2013, the Southern African Development Community (SADC) cited that out 25 cabinet members, 5 are women, representing gender equality, home affairs, finance, foreign affairs, and labor and social welfare.

In the Namibian judiciary, the highest role held by a woman is High Court judge, and currently 2 out of 12

(17%) are women. Of magistrates, 31 out of the 69 (45%) are women, and 33 out of 76 (43%) of the nation's prosecutors are women.

Finally, ever since Namibia's independence in the 1990s, women have remained consistent in having more than 40 percent representation at the level of local government. In 2010, 33 women mayors (27%) were elected to town and municipal councils, and on regional councils, which use single-member constituencies, 3 out of 13 (23%) governors were women in 2009, with 8 percent of women making up regional councils in 2010 (Namibia Statistics Agency).

The Women's Movement

The Namibian women's movement has a long and varied developmental history, which had sparse roots of resistance during the colonial period, when indigenous women suffered oppressive race, class, and gender issues because of apartheid. Some women participated in the struggle for independence, especially as moral and psychological supporters of the freedom fighters. When it became prudent in 1966 for the male-dominated South West Africa People's Organization (SWAPO) to lift oppressive constraints, women were allowed to serve as guerilla force combatants in their military wing, known as the People's Liberation Army of Namibia (PLAN). The establishment of SWAPO's Women's Council (SWC) followed in 1969, and it officially became a branch of SWAPO in 1976. Concurrently, a smaller liberation movement known as South West African National Union (SWANU) also established a women's wing. While recognizing the need to overcome women's oppression, the political agendas of these organizations sought to mobilize women primarily as aids to the struggle for independence. In light of the importance of this struggle, "it was only natural that the struggle for national liberation was accorded more prominence than the struggle for women's liberation in pre-independence Namibia" (Hubbard and Solomon 1994, 5). On the national front, these women's wings served productively and instrumentally in bringing gender-equity issues to the forefront and served as the foundation for future discussions of women's issues.

Two influential preindependence women's organizations are the Women's Desk of the Council of Churches in Namibia (CCN) which spoke out against apartheid, and the Namibia Women's Voice (NWV), which established 13 regional chapters within its first two years. The NWV had "a strong grassroots appeal in both urban and rural areas, but its membership also included educated women

in professions such as teaching, nursing and social work" (Hubbard and Solomon 1994, 6). Both organizations affected the lives of urban and rural women, and as efforts toward independence progressed, women in these areas became stakeholders in their own interests regarding gender issues. They organized on local levels to improve their daily lives as wives, mothers, caretakers, church members, harvesters, and more.

Following independence, the Namibian women's movement benefited from constitutional rights that specifically cited the importance of gender equality, and shortly thereafter, the Department of Women's Affairs (DWA) was formed. Operating out of the Namibian president's office, the DWA served a liaison between the government and women to develop a gender-equity agenda. Concurrently, the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) gained traction as the first legally binding gender-specific legislation that recognizes equality between women and men. Namibia ratified the convention in 1992, and the women's movement began to gain traction as women were assured of their fundamental freedoms and human rights.

A National Gender Policy (NGP) was developed in 1997 that sought to close existing political, cultural, and economic gaps, and the following year, a National Gender Plan of Action was launched to ensure its implementation. This had timely alignment with the United Nation's establishment of its Millennium Development Goals (MDG) in 2000, the third of which advocates for the global promotion of gender equality and empowerment women. Other significant organizations have emerged, including the Department of Women's Affairs (DWA), which works tirelessly on behalf of both urban and rural women but is challenged by overwork, understaffing, limited resources, and other looming pressures; the Namibia National Women's Organization (NNWO); Women's Action for Development (WAD); the Namibia National Students' Organization (NANSO); women-focused nongovernmental organizations (NGOs); and teacher and domestic worker trade unions that serve as sites for growing solidarity around gender equality.

As the Namibian women's movement is still in its infancy, sustained political change and gender equality for both urban and rural women remain elusive. Despite the rights afforded women by the constitution, the strides made by these organizations, and the protections secured by policies aimed at gender equality, there are still many women who know little about their constitutional rights.

Despite opportunities for autonomy in their villages and communities, women have to overcome much subordination in the struggle for gender equity.

Although hurdles loom large, there are many positives to the women's movement in Namibia that are encouraging. Through experience, women's groups have developed wiser ways to proceed in increasing awareness and seeking gender equality. While the ultimate ideal is national women's solidarity and equity, the "decision to abandon the vision of an all-embracing unity in favor of the idea of strategic 'unity-in-diversity'" is proving to be more practical because of the "complex geographical and ethnic distinctions which complicate the nation's urban-rural divide" (Hubbard and Solomon 1994, 2–3).

The status of women is tracked by the annual Global Gender Gap Index, issued by the World Economic Forum; in 2014, Namibia ranked 40th out of 136 countries, with the following rankings in four key areas: health and survival (first, along with 35 other countries); educational attainment (first, along with 25 other countries); economic participation (38th); and political empowerment (62nd). Overall, and though progress is slow, it is prudent for Namibian women to work more intentionally on local levels on issues relevant to their particular lives and regional circumstances.

Religious and Cultural Roles

Most Namibians are Christian, with the Lutheran and Catholic faiths predominating. There are also Dutch Reformed and Anglican churches, along with a small percentage of Namibians who still engage in traditional religious practices. Religion plays a large role in the lives of women, and in light of the emphasis on women's empowerment in UN Millennium Development Goal #3, there seem to be advantages in Christianity over customary religious practices in improving the status of Namibian women. These include opportunities to improve (1) the percentage of school-aged girls in school, (2) female adult literacy rates, (3) the female share of nonagricultural employment, and (4) female representation in government (Njoh and Akiwumi 2012, 1). While these practical opportunities have clear advantages for urban women, there is less direct impact on rural women. Nevertheless, Christian rural women are deeply entrenched in their faith traditions, and their churches serve dual purposes as sites for faith gatherings as well as civic meeting spaces, where they meet to develop co-ops, to encourage solidarity, and to seek ways to overcome gender disparities.

As women continue to assert their autonomy and seek gender equity, particularly as women of faith, a primary obstacle that challenges their progress is the patriarchal rule that characterizes the country as a whole. While urban Namibian women must actively fight for gender equality in both their private and public lives, it could be argued that their rural counterparts who still practice indigenous African religions enjoy a somewhat ideal form of gender equity. Because these women continue to follow the traditions of their precolonial ancestors, they play very active roles in both the domestic and public spheres of their villages.

Issues

Domestic Violence

In recognition of the wide-ranging types of incidents of abuse in Namibia, the Combating of Domestic Violence Act was established in 2003. It provides legal protection for victims of domestic violence, and it covers religious and customary marriages as well as other types of relationships. The term *domestic violence* is intentionally drawn in broad terms within the act and is inclusive of sexual, physical, emotional, psychological, and verbal abuse and harassment and intimidation. In courts of law, acts of domestic violence are judged as individually distinct cases.

Despite these legal safeguards, however, domestic violence is underreported for a variety of reasons, from shame to believing that it is a private matter. There is even less information about domestic violence against men, the elderly, and those in LGBT relationships. For women who are victimized by domestic violence, there are influential organizations such as Concerned Women against Violence against Women that work on behalf of women caught in this cycle of violence. There is still much work to be done, though, to improve the self-esteem for women who undervalue their worth and remain unaware of their constitutional and legal rights. Rural women are particularly vulnerable because they are undereducated, male-dominated, dependent, and often bound by customary traditions.

Sexual Assault and Rape

In the five years following passage of the Combating Rape Act 8 of 2000, an average of 60 rapes per 100,000 Namibians were reported, which does not account for those that

went unreported in both urban and rural areas. This act was revised in 2003 to include key changes and more specificity. For example, rape is defined in gender-neutral terms to include boys and men as potential victims; rape within marriage is included; the term “sexual acts” is made more explicit; children are provided more protection against sexual abuse; bail and minimum sentences for offenders were made more rigorous; rape victims may not be asked irrelevant questions about their sexual histories to protect their privacy; penalties were added for rapists who offend while knowing they are HIV-positive; and more.

The report *Rape in Namibia* notes that most rapes “were committed by partners, family members or acquaintances, with only about 12 percent of all rapes being committed by strangers. About 11 percent of the rape cases examined involved multiple perpetrators. The vast majority of perpetrators (more than 99 percent) were male, and about 13 percent of the perpetrators were young men under the age of 18” (GRAP 2006). Police statistics indicate that more than a third of all victims of rape and attempted rape were under the age of 18, and while Woman and Child Protection Units (WCPUs) have been developed within the police force, rape victims often endure unsympathetic responses when they report offenses (GRAP 2006).

Trafficking

In the mid-2000s, Namibia’s WCPU officials brought an awareness of sexual and human trafficking to the forefront in a country where the concept was virtually unknown. This general lack of awareness was confirmed in a report by the U.S. Department of State’s Office to Monitor and Combat Trafficking in Persons annual report (U.S. Department of State 2016), which identified Namibia as “a special case” in which the prominence of sexual exploitation and the trafficking in persons was not being researched or documented. In 2009, the *Baseline Assessment of Human Trafficking in Namibia* was prepared by the Ministry of Gender Equality and Child Welfare, which noted that trafficking includes sexual and labor exploitation as well as forced marriage and sale for body parts and organs. The assessment attributed the rise of trafficking in Namibia to the nation’s economic and unemployment situations and the victims’ belief in the promise of jobs and better educational opportunities.

Sometimes family members will knowingly traffic their children due to poverty, and sometimes they are

deceived into believing they are improving the lives of their offspring by trafficking them. Women are especially vulnerable to being trafficked, particularly school dropouts and unemployed young women. They may find themselves abandoned, homeless, and harmed by physical violence, and they are exposed to health hazards such as HIV and other sexually transmitted diseases. It is clear that many hurdles still need to be overcome, and “prostitution and sex trafficking in Namibia are social, economic and gender-inequality issues that require urgent attention by relevant authorities and development agencies in terms of prevention and protection interventions at policy, legislative and service levels” (Kiremire 2012, 1).

Nigeria

Overview of Country

Located on the western edge of Africa, the Federal Republic of Nigeria is a large country composed of a diversity of populations, cultures, religions, and complex socioeconomic and political structures. Its capital city is Abuja, and the country is bordered by the Atlantic Ocean and the nation of Benin to the west. The country of Niger borders Nigeria in the north, and the countries of Chad and Cameroon border it in the east. The country contains approximately 356,669 square miles of landmass, which is currently divided into 36 states, which contain 371 traditional ethnic groups. While many ethnic groups exist, the majority of people are Hausa Fulani, Igbo, and Yoruba.

Nigeria's large population is approximately 168.8 million (World Bank 2012) divided equally between rural and urban areas (UN Data 2014). People under the age of 18 comprise roughly half the population. Little differentiates the rural and urban areas in terms of population growth. The average life expectancy in Nigeria is 52 years, with women living 53 years and men living to 52 (UNICEF 2013; UNDP 2014).

A history of colonialism and foreign involvement colors Nigeria's political and economic climate. From 1914 until its independence in 1960, the territory that would become modern-day Nigeria existed as a British colony. In 1890, European and African converts introduced the first Western-influenced cash crop of cocoa. Interest changed to oil extraction in the early 20th century, and by the 1950s, the country had become a major producer for what is now known as the Shell Oil Company.

Nigeria's economy remains troubled by foreign investment and ethno-political conflict. Since independence from the British in 1960, the country has experienced a series of political and religious conflicts. One of the most noteworthy is the Nigerian-Biafra War, which was fought from 1967 to 1970 between the Igbos and the Hausa Fulani. The era after the war was characterized by swings between civilian rule and military dictatorship. In 1999, the people elected Olusagun Obasanjo as president, and in 2011, the people elected the current president, Mr. Jonathan Ebele Goodluck. The election and governance of these leaders mark the longest period of civilian rule in the country's history.

Reflecting a history of political turmoil, the current state of economic affairs in Nigeria is slow to improve. The

national currency is the naira (NGN). The main sources of gross domestic product (GDP) include agriculture, forestry, fishing, and mining. The mining industry includes production of oil, one of the nation's main sources of income, making Nigeria one of the world's largest oil producers. However, in the face of relative economic affluence, mismanagement of resources by the economic elite and stiff regulatory policy leave 68 percent of the country's population living on under USD\$1.25 per day (UNICEF 2013). The UN Development Programme in Nigeria estimates that the average per capita income rests at approximately USD\$1,280 per household (2014).

Much of Nigeria's colonial and postcolonial existence has been affected in some way by conflict between the country's two major religious groups, Christianity and Islam. Recent census data suggests an Islamic majority of 50 percent, Christians comprise 40 percent, and indigenous beliefs and practices 10 percent (Pew Research Center 2014; CIA 2017). The majority of Christians live in the south, and the majority of Muslims reside in the north. The two major sects of Christianity are Catholic (24.9%) and Protestant (74.1%) (Pew Research Center 2014). The majority of Muslims are Sunni.

Education

In recent years, Nigeria's state of affairs in specific sectors continues to improve, and one of these sectors is education. Between 2008 and 2011, more than half of Nigeria's children were in primary school, with near equal numbers of boys and girls enrolled and attending. Attendance is higher in urban areas. Rates of attendance dip for secondary education, but the gender gap decreases by a small margin during this phase of education. Disparities overall remain, and fewer than half of the country's children are actually attending school. By adulthood, literacy rates rest at 72.1 percent for men and 50.4 percent for women (CIA 2017). The gendered gap in attendance and literacy suggest that while all people suffer from poor education, women are disproportionately underserved by the country's struggling educational system (UNICEF 2013).

This trend continues as students graduate high school, with approximately 10 percent of students enrolling in tertiary or college-level education in 2005 (UNESCO 2012). Despite low enrollment rates, Nigerian university system has continued to expand from the single University College in 1948 to 128 colleges in 2011 (Clark and Ausukuya 2013). Higher education in Nigeria is presided over by the

Federal Ministry of Education. Low rates of student enrollment are attributed to a lack of general education funding and high unemployment, even after graduation. The unemployment rate among college graduates rivals that of those who only graduate high school. Data illustrate that while high unemployment is a national phenomenon, students with postsecondary degrees who seek employment in urban areas fair better than those in rural areas.

In addition to being split between urban and rural lines, divisions in education are also gendered. More men are enrolled in college than women. In 2005, the total number of women with any form of postsecondary degree, from bachelor's through doctoral, is just over one-third of the total degrees earned. Men and women also pursue scholarship along gendered lines, and less than 25 percent of women in Nigeria hold research positions at a master's or PhD level (UNESCO 2012). Starting early in socialization and education, girls are encouraged to seek training and jobs deemed "feminine," such as teaching, nursing, or clerical work. These fields pay less than more masculine fields, such as science and technology. Despite inadequacies in the system, acquiring an education is the best determinant of success for women in Nigeria. Scholar Tinuke M. Fapohunda states, "A woman's education beyond primary school is a reliable route to economic empowerment and long-term change in the status quo, as well as a determinant of a family's health and nutrition" (Tinuke 2012, 21–22). Made evident in statistics and scholarship, the educational success of young women exists as symbiotic relationship between the economy and the educational system from primary school through postsecondary education.

Health

Maternal Health

The state of maternal health in Nigeria reflects the prevalent attitude toward women and female sexuality. In 1990, the maternal mortality ratio (MMR) rested at 1,000 deaths per 100,000 live births. By 2012, the ratio had dropped to 350 deaths per 100,000 live births. The recent Midwife Services Scheme, which trains birth attendants and performs maternal care, serves as a positive force in decreasing the MMR. This organization works in conjunction with the Community Health Extension Workers Program and local branches of the Safe Motherhood Program, all presided over by the Nigerian government. Estimates indicate that the use of skilled birth

attendants during delivery rose from 38.9 percent in 2008 to 53.6 percent in 2012 (UNDP 2014).

Decreased fertility rates, increased focus on family planning, and increased rates of contraceptive use reflect changing attitudes toward childbearing and have led to improvement in the country's maternal health. The Nigeria Demographic and Health Survey (NDHS) refers to family planning as an effort by families to "limit or space the number of" their children via contraceptives. Modern methods include female sterilization, male sterilization, the pill, intrauterine devices (IUD), injectables, implants, male condoms, female condoms, the standard days method (SDM), and the lactational amenorrhea method (LAM). Traditional methods include rhythm (periodic abstinence) and withdrawal. According to data from 2013, 15 percent of all married women use a contraceptive as part of family planning.

Rates of contraceptive use are highest among women and in urban areas (27%) versus rural areas (9%) (NPC 2014, 14). Differences in region also contribute to varying rates of contraceptive use. The NDHS divides Nigeria into six regions: north central, northeast, northwest, southeast, south, and southwest. The survey noted the highest rates of use in southern Nigeria and the lowest rates in northern Nigeria. In addition, data on education suggests that the more education a woman possesses, the more likely she is to engage in some form of family planning (NPC 2014, 17).

Women are systematically denied the right of reproductive choice in terms of both female genital cutting (FGC), sometimes called female genital mutilation (FGM), and legal and safe abortion. First, the high prevalence of FGC stems from the traditional notions of womanhood placed on Nigerian women. Much importance is placed on a woman's domestic capacity to bear children and maintain her status as the ideal wife and partner. While the practice of this procedure varies in severity across villages, cities, and states, ideologies driving this practice remain consistent. Many believe that cutting female genitalia will reduce the potential for promiscuity in women after it is performed. It is believed that it will protect her potential for marriage, making her less likely to engage in premarital and extramarital sex.

Due to the young age at which girls undergo FGC, they are often not told about the operation until it is about to take place, nor are they given the opportunity to consent to or decline the procedure. The girls are often lured and tricked into the area and then are physically restrained by elders who perform the cutting, often without a painkiller.

The health risks associated with FGC make it a pressing human rights issue. The procedure is often performed in rural areas with poor medical tools, putting girls at risk of infection, hemorrhage, and even death. A poor legal framework exists to protect Nigerian women and girls from FGC. While norms are shifting in urban areas, few states even possess legislation to punish those who commit the act, and states that do have statutes largely fail to enforce them. Overall, FGC represents the discriminatory dynamic of the traditions of patriarchal patterns reinforced by fundamental culture in both Islamic and Christian societies across Nigeria.

Similar to the phenomenon occurring with FGC, women are culturally and systematically being denied the right to reproductive choice regarding their pregnancies. Nigerian women suffer from a lack of access to safe and legal abortions. Abortion is legal only to save the life of the mother, and in the southern states, it is also legal for physical or mental health reasons. Two physicians are required to confirm the threat to the woman's life. This does not prevent thousands of women from seeking out abortions, however, and unsafe abortions are performed by unqualified practitioners and are more likely to cause illness or death. According to the Society of Gynecologists and Obstetricians of Nigeria, 760,000 induced abortions are performed each year, and about 20,000 women die, leading to one of the highest rates of death from unsafe abortion in Africa (CIA 2017).

Diseases and Disorders

Due to the country's overwhelming poverty, many suffer from poor health and substandard health care. Malnutrition, a lack of immunizations, and significant rates of disease afflict the population. Between 2007 and 2011, approximately 23 percent of children were determined to be either moderately or severely underweight from poor nutrition, and 41 percent of children suffered from stunting, defined as low height for the child's age (UNICEF 2013). In addition, in 2011, only 58 percent of the population had access to clean sources of drinking water, and in rural areas, the figure dropped to only 43 percent. A similar pattern replicates itself with sanitation facilities. In urban areas, 35 percent of people have access to facilities, and a mere 27 percent have access in rural areas (UNICEF 2013).

The country's tropical location and a lack of knowledge about disease by the general population contribute to the ill health of the Nigerian people. First, the country's

tropical location near the Niger River Delta contributes to an environment ripe for the breeding of mosquitoes, the prime culprits of the propagation of malaria. As one of the Millennium Development Goals (MGDs), the United Nations has worked to distribute methods of malaria control that include doses of antimalarial drugs and millions of insecticide-treated nets (ITNs) (UNDP 2014). UNICEF reports that between 2007 and 2012, 42 percent of households possessed at least one ITN, and 29 percent of children had access to one or more. However, malaria is often deadly, especially in youth, as fewer than half of children displaying malaria symptoms get treatment.

Second, a lack of knowledge about the nature of disease contributes to the spread of sickness. Common immunizations against diseases such as diphtheria, hepatitis B, and tuberculosis (TB) are rare. The more education Nigerian parents obtain, the more likely they are to have their children vaccinated. In 2008, the overall rate for immunization of children for measles increased twofold from 15.8 percent to more than 30 percent when the child's father or mother had a secondary education. In addition, figures remain similar when mothers had secondary education and the fathers only primary (Rammohan, Awofeso, and Fernandez 2012, 3). Across Nigeria, preventable diseases often lead to widespread vectors of mortality because children do not receive vaccinations (UNICEF 2013).

In addition to other communicable diseases, HIV/AIDS influences the health of Nigeria's people with great force. Some states still struggle to reduce rates of the disease and generate awareness (UNDP 2014). Studies show that younger women ages 15–24 in urban areas are more likely to have an awareness of the virus than older women in their thirties and beyond. Data also suggest that younger women are more likely than older women to use protection when having sex. Data also suggest that reported rates of condom use for men ages 15–24 fell below reported rates of usage for women of the same age group. In addition, the relationship between education and prevention seen in women replicates itself across the male demographic (NDHS 2013, 40–42). More than 10 million cases of HIV are female (Tinke 2012, 18). A relationship exists between education and prevention. Education serves as sexual empowerment for the Nigerian people, especially women.

Employment

While the proliferation of education across Nigeria contributes to the empowerment of women, it also leads to

increased employment and economic stability for the country. For women in particular, secondary and post-secondary education have the power to transform their financial lives. Education puts women on a path to sound employment, economic stability, and financial independence, facilitating a workforce that includes both genders. Greater numbers of women working in leadership positions, in politics, as professors, and as the primary breadwinners are evidence of this phenomenon. While a greater percentage of men than women are working, the rates of employment for both groups continue to increase (UN Data 2014).

Despite the improvement in women's participation in the labor force, only 3 out of 10 women in the labor force are in paid employment, and women have a two-thirds lower chance than men of obtaining a consistent hourly wage (UNDP 2014). Contributing to the wage gap, men dominate the country's industrial sector. Only 5 percent of the female labor force works in industry, 6 percent in "professional, technical, administrative, or managerial positions," 20 percent in services, and 23 percent in sales (NBS 2016). Such low numbers of women in industrial, management, and professional positions partially explains the gender pay gap.

In addition to wage inequality, Nigerian law fails to include provisions that guarantee equal pay for equal work or maternity leave. Work in the trading and home-based business sector provides little for women in terms of protection or monetary gain, and often serves as one of the last bastions to stave off unemployment. In addition, to combat poverty, some women turn to sex work to support themselves. Women of all educational backgrounds serve a productive role in the economy; however, political and economic instability and gaps in the legal system leave much to be desired by many.

However, the upward employment trend from 2005 to 2011 remains a result of postcolonial Structural Adjustment Programs (SAPs) that have problematic legacies and detrimentally impact the economic mobility of women. The economic, religious, and political conflict that plagued Nigeria during the first two decades of independence led world powers such as the United States and the United Kingdom to implement these programs in 1983. While put in place to create a capitalist infrastructure and improve the living conditions in the country, the policies' emphases on export economies and high efficiency proved detrimental to the social welfare state. Policies of free trade were matched by cuts in social spending and privatization

of state services. This contraction of the state created a scenario that put tremendous financial burden on families. Between 1985 and 1990, 2.5 million women lost their jobs due to the aftereffects of SAPs. An overwhelming majority of women continue to take responsibility for informal and unpaid work, such as caring for those who fell between the cracks with the shrinking of social welfare benefits (Tinuke 2012, 18–21). The effects of SAPs further exacerbated the gendered and economic challenges Nigerian women face.

Despite the role of SAPs in dampening the rise in the number of women in the formal economic sector, informal, underpaid, and unpaid female labor remains strong in rural and agrarian Nigeria. Agriculture employs approximately 80 percent of Nigeria's women. In addition, these women are responsible for 70 percent of food production, 50 percent of domestic food storage, 100 percent of food processing, 50 percent of animal husbandry, and 60 percent of agricultural marketing. SAPs have also contributed to the increased dominance of men in the agricultural labor force. The focus on the export economy encouraged by SAPs created a gendered divide between agriculturalists. This system hurts the nation's women because most female farmers do not generate enough revenue from their lower-demand yields to purchase and obtain the acreage needed to support higher-revenue types of export crops that men own (Tinuke 2012, 20).

Family Life

The empowerment of women in the public and domestic sphere is crucial to ensuring gender equality. While no direct correlation connects marriage and the disempowerment of women, scholars point to social norms as the primary factor in the perpetuation of detrimental marital traditions in the Nigerian state. Igwesi explains that families socialize girls into domestic roles via chores, such as sweeping, washing, and cooking, while encouraging boys to take on manual labor, such as cutting grass and washing cars (Igwesi 2012, 219–220). Igwesi notes that socialization begins at a young age.

Such an early gendering of children is matched by the strong tradition of marriage, which is supported by Nigerian laws. Following tribal practices, such laws create the current structure and reinforce cultural norms of headship and patriarchy. Both traditions and the law reinforce the conception that those in the domestic sphere of men hold the position of “household head” and maintain primary authority over the family. However, recent statistics suggest

that things are slowly beginning to change. Women head 31 percent of households in rural and urban areas. A “double burden,” otherwise known as women working both in the home and outside the household to earn a secondary income, affects the lives of many (Okome 2005, 6). Such terminology suggests that while women still adhere to tradition, their role is expanding based on the economic needs of their families. The economic activity of a woman is indicative of her household's welfare because “women spend more of their increased earnings on food, medicine, and education for their children and other dependents” (Tinuke 2012, 18). As evidenced above, women are often tasked with both providing for the family at home and in the workforce. However, this added responsibility rarely comes with an extension of rights for women in marriage.

Scholars define marriage in Nigeria as “exogamous,” meaning that daughters must marry outside of their village community. Such a practice forces a daughter out of her traditional village and into the village and home of her husband's family. According to tradition, families strip their newly married-off daughter of “rights of succession,” denying her any claims to wealth through her father's lineage. In addition, fearing the possibility of divorce, she is also denied any wealth or property rights under her husband's family. Child marriage rates are high; 40 percent of girls are married before the age of 18 and 20 percent by the age of 15. With the exclusion of women before the law in terms of inheritance and property and the young age of marriage, the Nigerian state does little for women when they enter into marriage (UNFPA 2004).

In addition to the practice of exogamous marriage, Nigerian society practices polygyny. This practice of men taking on more than one wife was originally designed to provide women with the ability to be more fully engaged in contributing to larger society, and some argue it frees women to pursue trade, politics, and religious leadership. However, the influx of colonial powers constricted the role of women in society and thereby failed to enfranchise most women, regardless of marital status. In reality, the practice creates a situation that most often disempowers women due to the practice's emphasis on male-dominated elements of society. (Okome 2005, 8).

Reinforced by an unequal and lacking legal system influenced regionally by fundamental Islam, the northern regions of the state afford women little legal protection against violence, rape, and child marriage. Culture and religion see a wife as the property of her husband. Because she is legally interpreted as his property, a husband has the

“moral right” to beat her if he perceives she has committed “insubordination or perceived wrong doing.” The Nigerian Penal Code of the Northern States goes so far as to support wife beating, stating, “A wife can be beaten with ‘a stick not bigger than the husband’s thumb’” (294). The former minister for women and social developments Mrs. Hajo Sani suggests that low rates of reporting violence are due to two factors: (1) a fear of retaliation from her husband and extended family, and (2) the seemingly innocent offense of “two people fighting” when cases are reported (Makama 2013, 125). Specifically, in northern Nigeria the penal code legalizes any action by a husband “for the purpose of correcting his wife” as a “lawful form of correction.” Such policies follow traditional dictates of sharia law and the concept that in marriage the wife is regarded as property. Violence against women is rampant and difficult to prosecute (Ozo-Eson 2008, 293).

Similar logic governs rape, widowhood practices, and child marriage. Currently, no provision exists to protect women from marital rape, and Nigerian law fails to recognize the concept even when women are physically and visibly injured in rape. In the rare cases where a woman seeks redress, she must prove that she did not consent. The penal code specifically excludes “sexual intercourse by a man with his own wife.” In addition, if a woman reports rape, she is considered to have committed *zina*, otherwise known as sex outside of marriage, as no conception of marital rape exists within the legal system; thus, she must have committed adultery. In addition, Muslim law discounts female testimony as less relevant than that of a man, making any attempts to fight difficult for Muslim women or women in areas of sharia law.

The plight of widows is also ignored by society’s unequal structures. Traditional widowhood practices are harmful to the physical, psychological, social, and cultural health of women. These practices include drinking the water used to wash her husband’s corpse, washing her with the decomposed body of her spouse, cutting her hair to humiliate and shame her, and, in the worst of cases, blaming her for the death of her husband. In addition, due to a woman’s lack of property rights, a wife often loses any land she held with her former partner. Work by the Rural Widows and Orphans Foundation (RUWOF) has created a bill to help protect widows and their children. Again, structural inequality in Nigeria continues to disenfranchise the women of the country.

Girls are often victims of the patriarchal structures that marriage perpetuates. They are often pulled from school at

early ages because tradition sees them as the next wives, mothers, and caretakers. Some girls are even forced into marriage as part of a transaction to better the financial situation of their parents. Such structures of oppression begin while these girls are young, and the law does little to protect them as they take on the responsibilities of womanhood as children.

The same logic used to justify wife beating, rape, widowhood abuse, and child marriage replicates itself in a culture that attempts to regulate female sexuality. This mentality extended to the creation of recent laws that attempt to regulate a woman’s appearance and reproductive rights. In the northern states of Zamfara and Kano, efforts to police women include forcing them to sit only in the back of motor vehicles, imposing a midnight curfew, and imposing a strict and conservative dress code. These efforts were made public in the Bill on Public Nudity, Sexual Intimidation and Other Related Matters. In 2008, Senator Eme Ekaette presented the bill to the National Assembly, where she argued that both Christianity and Islam mandated its necessity. Her bill sought to make “public nudity,” otherwise called “indecent dressing,” a crime for the women of Nigeria. This bill did not become law, but it still shows that the sexuality of women is subject to a heightened scrutiny that men in Nigeria do not face.

Politics

Set against its history of colonialism and structural adjustment, over the last two decades, Nigeria has made significant strides toward achieving democracy. However, legacies of violence and government disorganization from development practices continue to affect the current political system in the country. Patterns of disorganization, disenfranchisement, violence, and human rights abuse leave the country’s women and children in a precarious position.

Women have been systematically denied political rights throughout Nigeria’s history. As late as 1975, women lacked the right to vote in Nigeria’s north. The efforts of collective organizing by women culminated in the enfranchisement of women in the east in 1954, in the west in 1958, and in the north in 1976. Throughout history, Nigeria’s women have organized against political discrimination, and the tradition continues with such organizations as the National Council of Women’s Societies (NCWS) and Women in Nigeria (WIN).

Despite its struggle for rights and political autonomy, the country has been making progress since its successive

ratifications of the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) in 1984, 1985, and 2001. While progress on the rights of women and children occurs in terms of political agreements, much work needs to be done in terms of real-world action.

Groups such as BOABAB for Women's Human Rights, Women Living under Muslim Laws (WLUML), and Women's Rights Protection and Advancement Alternative continue to address issues impacting the rights of women and their status as citizens. Recently, BOABAB for Women's Human Rights and the Women's Rights Protection and Advancement Alternative have fought against sharia law and its punishment of *zina*. Other cases involving BOABAB include successfully challenging the public morality and indecency bill that they defeated in 2008. Such cases exemplify the effective work done by these organizations and suggest that the rights of women will expand in Nigeria.

In addition to contributing as activists and organizers, the number of women in formal leadership roles continues to increase at the village, local, and state levels. Despite recent increases, women only hold 7 percent of parliamentary seats in Nigeria, despite comprising 49.1 percent of the country's population (World Bank 2017). According to the Independent National Electoral Commission, of the 7,160 total candidates that ran for the presidency, Senate, House of Representatives, and governorships, women made up only 628 of the candidates. Out of the 25 candidates for president, only one was a woman. When women reach positions of authority, they often experience a lack of support. Patriarchal systems, difference in political viewpoints, and a lack of financial support often hinder women in office. Despite the difficulties women face in politics, the National Gender Policy exists to ensure that women's political participation is at least 35 percent. This goal has yet to be met (Makama 2013, 123–124).

LGBT

Many Nigerians see nonheterosexual marriage and LGBT rights as less important than heterosexual marriage. Many look to traditional Christian and Islamic doctrines that condemn gay and lesbian sexuality and marriage. Due to this mind-set, the public may ignore discrimination based on sexual orientation when it does occur. A recent law, the Same Sex Marriage Prohibition Act, made gay marriage

and membership to gay clubs, societies, and organizations illegal and punishable by jail time.

Religious and Cultural Roles

Historically, religion has been a major source of conflict in Nigeria. Religious power is often a stepping-stone to political power, and religious community leaders leverage both. The 1970s marked an era of religious insurgency by both Christians and Muslims in Nigeria. In the predominately Christian south, during this era, scholars point to the rise of the "Charismatic Movement" among youth possessing a postsecondary education. The Nigerian Charismatic Movement existed as part of the global Pentecostal Movement, with fundamental Christian ideals. While a colonial legacy of Pentecostalism persists, this movement of Charismatics belonged to the educated elite.

Women's Voices

Chimamanda Ngozi Adichie

Chimamanda Ngozi Adichie is a Nigerian feminist writer. She studied medicine and pharmacy at the University of Nigeria. Adichie left Nigeria to study communications at Drexel University in the United States at 19. She received her bachelor's degree in communications and political science from Eastern Connecticut and her master's degree in creative writing from Johns Hopkins University. She is best known for her books *Purple Hibiscus* (2003), *Half of a Yellow Sun* (2006), and *Americanah* (2013). Her writing highlights the importance of ethnicity in Nigerian society as well as the struggles of Nigerian immigrants. Her 2014 essay "We Should All Be Feminists" is adapted from a TEDx Talk of the same name in which she discusses what it means to be a feminist. Recently, this essay was distributed to every 16-year-old in Sweden in an effort to open the discussion about gender equality (Flood 2015).

—Lauren Brown

Flood, Alison. 2015. "Every 16-year-old in Sweden to Receive Copy of We Should All Be Feminists." *The Guardian*, December 4. Retrieved from http://www.theguardian.com/books/2015/dec/04/every-16-year-old-in-sweden-to-receive-copy-of-we-should-all-be-feminists?CMP=fb_gu.

During early independence from Great Britain, the same period saw an increase in Islamic practice and fundamentalism. Similar to the appeal of Pentecostalism in the south, Islamic fundamentalism (*Izala*) gathered many young followers disenfranchised by the nation's political climate in the 1970s and 1980s. In the 1970s and 1980s, the country experienced numerous attempts by religious leaders to install sharia law. Efforts were long-lasting, as northern Nigeria still bears the affects and customs of Islamic law, which was made constitutional in 1978. In October 1999, the state of Zamfara instituted "the first Shari'a based system of government." Proponents of such a system sought to curb corruption and decadence through laws strictly interpreting the Koran's teachings into practice.

Most noteworthy from Pentecostalism and sharia law are the implications for the autonomy of women. Bastions of traditional gender roles, both forms of religious extremism limit the rights of women by reinforcing traditional roles of domesticity. While the legal implications of Pentecostalism mainly limit themselves to domestic roles and student movements, sharia law has gone as far as to regulate "morality and decency" through the penal code. Such law codes criminalize women for participating in sex outside of marriage (while not prosecuting men), make rape nearly impossible to prosecute, and have attempted to legislate the dress of the country's women. In a country with a history of political turmoil, religious groups grapple for power to institute some form of stability, and many measures routinely infringe on the rights of women and girls. In addition, since independence from colonial rule, fundamental Christianity and Islam have perpetuated bloody conflicts in the nation. Religious and political conflicts exasperate already difficult situations for women.

Issues

Violence

While a multitude of issues affect the women of Nigeria, specific issues include violence tied to environmental exploitation and human trafficking of girls and women. Both issues have a tremendous effect on Nigeria and play a disproportionate role in the lives of women and girls.

First, due to its location on the Africa's western coast, Nigeria boasts habitats of environmental diversity that include minerals that comprise petroleum-based products. Nine states in Nigeria produce crude oil: Rivers, Bayelsa, Delta, Edo, Imo, Abia, Akwa-Ibom, Cross-River,

and Ondo. While comprising only a small sliver of the GDP, oil provides over 80 percent of the government's annual revenue. Stemming from its historical monopoly on the continent, Shell owns nearly 50 percent of the country's oil produced. Because of this partnership, Shell and the Nigerian government work as a singular unit and a driving force of environmental destruction. With Shell controlling the use of oil fields for profit, the environment regularly pays the price of such extraction (Ibeanu 2000, 21).

Oil production hurts the people of Nigeria in terms of environmental destruction and issues of land rights. Studies suggest that the extraction of oil has created severe consequences on the land from which companies pull the mineral. Because of the state's profit from the oil business, the government fails to act in the interests of citizens and promotes the nation's economic interests over the rights of its citizens. In addition, such practices disproportionately affect women, as studies indicate that the majority of Nigeria's agricultural work is performed by women (Tinuke 2012, 19). The government's favoring of the oil business has generated protests. Beginning in the early 1990s, oil-rich communities started to mobilize against the government, forming organizations such as the Movement for the Survival of Ogoni People (MOSOP), the Movement for the Survival of Ijaw Ethnic Nationality (MOSIEN), and the Ijaw Youth Council. Resistance to government efforts began with legislative tactics, such as the drafting of a Bill of Rights by MOSOP in October 1990. Ogoni leaders found the lack of government response to the bill unsatisfactory, and violence ensued. Similar patterns replicated themselves with the Ijaw people, leading to violence in the late-1990s. Periodic violence has continued through the last decade, and scholars suggest that national and local leaders will find a solution only with the removal of the emphasis on fiscal compensation and agreements with residents in the affected areas. Scholars suggest that the government must rid itself of corrupt bureaucratic policies, and oil companies must act as "responsible corporate citizens." Action such as this would reprimand a system that currently serves to advantage government officials and oil companies and that promotes the destruction local communities and habitats.

Trafficking

Stemming from similar economic conditions that perpetuate oil extraction, human trafficking is also a pressing issue. Nigeria serves as source, transport, and destination country

for trafficking. While the government has attempted to mobilize against trafficking, its restriction of information regarding the crime creates a stagnant situation. Trafficking in Nigeria falls into two categories: human trafficking for general labor and sex trafficking for prostitution. Due to the dire need for agricultural labor on the African continent, according to UNICEF, out of the approximately 330,000 children employed in the cocoa industry, 12,000 out of the 230,000 working in Ivory Coast possessed no family connection to the cocoa farmer. In addition, 2,500 of these children were reportedly recruited by outside intermediaries in Nigeria and Ivory Coast. While trafficking for farm labor affects both genders, women and girls are more frequently affected by this practice due to the country's gendered dynamics and women's agricultural labor (Makama 2013, 128).

In addition to exploitation for agricultural labor, it is common for a girls and women to be trafficked internationally for the purpose of sex work. In contrast to trafficking for farm labor, in the last 10 years, adolescent girls and young women have been trafficked to Europe for work in the sex industry. Often lured into the industry on false premises by employers promising them good jobs, these women are dropped into the hands of pimps and handlers upon arrival. Largely from poor areas, many families see their daughter leaving to work abroad as a means to escape poverty. However, they will likely not benefit from her labor.

In the last decade, Nigeria has made an effort to stop trafficking and the exploitation of the labor of women and girls. In 2003, the country passed the *Trafficking in Persons (Prohibition) Law (Enforcement) and Administration Act 2003*. In addition to creating legislation, this act created the National Agency for Prohibition of Trafficking in Persons and Other Related Matters (NAPTIP). Known as the NAPTIP Act, its provisions criminalize crimes related to human trafficking, and it serves as a major resource for addressing and protecting women and girls from trafficking and violence. The act prohibits the export or import of girls and women. In girls under the age of 18, it prohibits their procurement, seduction, and indecent treatment; and in women over the age of 18, it prohibits their procurement, import, export, and exploitation. In addition, the act provides women and girls the legal grounds to gain back their rights and sue their perpetrators. In 2005, the act was amended to increase penalties for trafficking offenders and to prohibit all human trafficking. Perpetrators face a fine of USD\$670 and 10 years in jail for labor

trafficking, 10 years' imprisonment for trafficking of children for forced begging or hawking, and a sentence of 10 years to life for sex trafficking.

Despite the strictness of these policies, they have yet to really help curb sex trafficking in Nigeria. Part of the issue is the numerous channels used by traffickers and trafficking victims. This issue is twofold. First, a lack of coordination between police, customs, immigration, and NAPTIP officials prevents enforcement. Due to the multiple entities of this bureaucracy, women are consistently falling through the cracks despite efforts by law enforcement to protect them. The second major factor in the difficulty of enforcing anti-sex trafficking measures is the long-standing national corruption and collusion with traffickers. Scholars suggest that government organizations, nongovernmental organizations (NGOs), and human rights activists must work together to close these gaps to eradicate human trafficking.

Evidence demonstrates the fact that while the situation of women in Nigeria may be slowly improving, much work needs to be accomplished to further their position as enfranchised citizens. Policies aiding women on the issues of employment, education, violence, and sex trafficking must be implemented and strengthened by the Nigerian government to empower present and future generations of women. To quote scholar Tinuke M. Fapohunda, "It is clear that there are interconnections between women's inequitable gender relations, and their poverty and powerlessness in society. There must be a frontal assault on all of these issues. Enabling women to protect themselves involves improving their social and economic status; and providing a method over which they have sufficient control" (Tinuke 2012, 26). Fapohunda advocates that change on all levels, especially in social and economic settings, *must* be made to improve the rights of women in Nigeria and around the world. Change is not optional; it is necessary for survival.

P

Palestine

Overview of Country

Palestine is located in the Middle East between the Jordan River and the Mediterranean Sea, and it is separated into the West Bank and the Gaza Strip. The West Bank is bordered by Israel and Jordan, and the Gaza Strip is bordered by Israel, Egypt, and the Mediterranean Sea. The West Bank is approximately 2,263 square miles (5,860 sq. km), with a mostly rugged terrain. The Gaza Strip is approximately 139 square miles (360 sq. km), with a mostly flat terrain and sandy dunes on the coastline. The climate is mild, with hot, dry, humid summers and cool, wet winters. As of July 2014, the population of the West Bank was estimated to be 2,785,366, and the population of the Gaza Strip was estimated to be 1,869,055 as of July 2015 (CIA 2017).

In 2014, the UN Development Programme (UNDP) ranked the State of Palestine 107th out of 187 nations based on human development. The United Nations gave Palestine a gender inequality Human Development Index (HDI) of 0.686 in 2013, which placed it in the medium human development category. Between 2005 and 2013, its HDI increased at a rate of 0.70 annually, indicating that the level of inequality in Palestine is increasing. This can partially be attributed to the rising levels of violence against women, which may be due to women becoming

more involved in activism while segments of Palestine are becoming more conservative and returning to traditional values.

Historically, there have been tensions and outright conflict between Israel and Palestine over land that was given to Israel following World War II. Most of the conflict has been a result of disagreements over where Jews and Muslims can live. A peace settlement was made in 2005, which resulted in the two states of Israel and democratic Palestine. The Jewish people moved to Israel, and the Palestinian Arabs moved to Palestine. A truce declared in August 2014 left Hamas (an Arabic acronym for “Islamic Resistance Movement”) in control of the Gaza Strip and the Palestinian Authority in control of the West Bank. Most of the people who live in Palestine are Palestinian Arab and follow the Sunni branch of Islam. The most common languages spoken are Arabic, Hebrew, and English.

Girls and Teens

Extracurricular

In Palestine, it is common practice for girls to visit each other to converse, usually with tea, coffee, and sweet desserts being shared. There are many centers available for girls to play music, join clubs, and take classes. Schools usually do not provide extracurricular activities.

Literacy

Most girls in Palestine attend school and receive a formal education. This is because most children receive a free kindergarten through 12th grade education. Schools are usually divided based on gender. Girls in the West Bank and Gaza Strip spend an average of 14 years in school. These rates are slightly higher than they are for boys, which may be because boys stop attending school to begin working.

Family Roles

It is considered unacceptable by most Palestinian men for women to work outside of the home, so most women and girls spend their lives doing homemaking or working in small home-based businesses. It is frowned on for females to wear Western-style clothing, with a preference for females to wear the traditional *jilbab*, a dress with a headscarf. Girls are obedient to their fathers and other men in their lives because of the patriarchal system present in Palestine. Mothers usually cook the meals for the family. Older sisters frequently care for younger siblings. Male children typically help their fathers with outdoor labor.

Education

The adult literacy rate in Palestine from 2008 to 2012 was 95.3 percent. In the same period, the youth (15–24 years) literacy rates were 99.3 percent for males and 99.4 percent for females (UNICEF 2016). Conflict in Palestine has left hundreds of schools damaged, including many that are beyond repair. The UN Relief and Works Agency (UNRWA) has built schools in refugee camps so refugee children are also able to access education.

Primary Education

Palestinians consider education extremely important because it is a means to improve standards of living and employability. Primary education is compulsory and free for Palestinians for the first 10 years. From 2008 to 2012, the primary school net enrollment ratio was 89.6 percent for females and 89.9 percent for males (UNICEF 2016). Special needs and disabled students have equal rights to education as nondisabled students. Most schools are divided for males and females. The educational system is divided into two stages: preparatory, which covers grades 1 through 4, and empowerment, which covers grades 5 through 10. Children start their primary education when

they are six years old. Many of the schools in Palestine experience overcrowding and have poor sanitation.

Secondary Education

Secondary education is for grades 11 and 12. It is not compulsory or free for Palestinians. From 2008 to 2012, the net enrollment ratio was 85.3 percent for females and 77.5 percent for males. More than 90 percent of students who complete their primary education enroll in secondary school (UNICEF 2016). Students who plan to attend a postsecondary education enroll in secondary education. Upon completing their secondary education, students must take an examination, *Tawjihi*, which they must pass to obtain their secondary education certificate.

Postsecondary Education

Many Palestinians enroll in postsecondary education after completing their secondary education. These students usually enroll in 1 of the 43 different postsecondary institutions that are located in Palestine. More women than men are enrolled in colleges.

Job Training

Job-specific training required for employment is typically provided and paid for by the employer.

Health

In general, Palestine has a well-developed health care system. Palestinians have limited access to the specialized hospitals located outside of Palestine. Health care is hardest to access for Palestinians living in the rural portions of the territory. Health care in the Gaza Strip has been affected by a lack of electricity, unmaintained medical equipment, and a lack of necessary drugs. Smoking is common in Palestine, and the rates are continuing to grow. This has resulted in predictions that increasing numbers of Palestinians will die from tobacco-related diseases. A survey conducted by the World Health Organization (WHO) in 2010 and 2011 found that among adults 15–64 years old, 37.6 percent of males and 2.6 percent of females currently smoke tobacco, with a cumulative percentage of 20.2 percent of the population. The same survey found that 57.8 percent of the population was overweight, and 26.8 percent of the population was obese. Raised blood pressure was also found to affect a large proportion of the population, with 35.8 percent of

the population taking medication, and 24.7 percent of the population having raised blood pressure for which they are not taking medication (WHO 2016).

The conflicts in Palestine have affected water quality. Organizations such as UNICEF are working to rehabilitate water sanitation so that it is safer and healthier for Palestinians to drink. Additionally, UNICEF is providing hygiene supplies to improve health and reduce the spread of illness. In 2012, the life expectancy at birth was 73 years (UNICEF 2016).

Access to Health Care

Health care is hardest to access for Palestinians living in the Gaza Strip or in rural areas. The public health care system is well developed but poorly maintained. There are health care centers in the West Bank and Gaza Strip; however, many specialists are located outside of Palestine. If specialized health care is deemed necessary for a patient, it is common for Palestinians to be referred outside of the territory, but restrictions prevent many patients from leaving the territory for their care.

Gender, Power, and Sexual Dynamics of HIV/AIDS

Palestine has low reported levels of AIDS and is thus considered by WHO to be a low-prevalence country. Due to Palestine having few people with AIDS, those diagnosed receive their health care at no cost to themselves. HIV cases started being reported in 1989, and since that time, only 72 cases have been reported (WHO 2016). Most of these cases have been men. However, this may not accurately reflect the actual number of people that have or had HIV/AIDS, as testing and diagnosis remains an issue. Many physicians in Palestine are not familiar with HIV and its pattern of symptoms, and many people do not or cannot seek health care in the first place. Additionally, HIV cases had to be diagnosed and treated in Israel because the infrastructure was not in place in Palestine, which likely reduced the number of diagnosed cases.

The most common causes of HIV infection in those diagnosed are heterosexual contact with an infected person and exposure to contaminated blood or blood products. Stigma remains a problem in Palestine, as it does elsewhere in the world. Antiretroviral (ARV) therapy is beginning to be used in Palestine, after WHO introduced it to the territory. This therapy will help prolong life span and improve quality of life for those with the disease. WHO introduced the first HIV clinic, in Ramallah, to provide care and monitor CD4

levels to detect treatment potential in patients. It also introduced the “rapid test” HIV test, which can be administered by anyone, to increase test compliance.

A large portion of the population is still uneducated about HIV/AIDS and its transmission. From 2008 to 2012, only 7.2 percent of young people (aged 15–24) had comprehensive knowledge of HIV (UNICEF 2016). Comprehensive knowledge is defined as being able to correctly identify the two major ways of preventing the sexual transmission of HIV, rejecting the two most common local misconceptions about HIV transmission, and knowing that a healthy-looking person can have HIV. Rates of HIV/AIDS in Palestine are increasing, with most of those diagnosed being heterosexual males. This has been attributed to a lack of awareness as well as poor access to safe-sex materials, such as condoms.

Diseases and Disorders

Mental Disorders

The many conflicts in Palestine leave half of Gaza’s children suffering from psychological distress due to violence, seeing their neighborhoods turned into rubble, and losing their schools (WHO 2016). Organizations such as UNICEF are working to provide counseling and psychological services to children experiencing distress.

Cardiovascular disease, in addition to cerebrovascular diseases and cancer, is one of the main causes of death among adults in Palestine. Heart disease was the leading cause of death in Palestine in 2004, with 56.8 percent of deaths being attributed to the disease. Cancer affects many people in the Palestinian population. Breast cancer is the most prevalent type, with 16.4 percent of all cancer cases being that form, and 31 percent of female cases were for breast cancer. Lung cancer is the most prevalent type of cancer in men, composing 12.7 percent of the male cases. From 2000 to 2004, the annual average mortality rate from cancer was 26.8 per 100,000 people.

Diabetes mellitus has a high prevalence in Palestine, and is expected to continue increasing. Studies have found diabetes mellitus rates in Palestine of 9–18 percent of the population. Between 2000 and 2004, 3.6 percent of population deaths were attributed to diabetes mellitus (WHO 2016).

Childbirth and Maternal Health Care

Most Palestinian women have access to maternal health care. From 2008 to 2012, the percentage of women aged

15 to 49 using contraception was 52.5 percent (UNICEF 2016).

Most women receive health care during the course of their pregnancies. However, an estimated 80 percent of women do not receive postnatal care. A UNRWA survey in 1999 found that 97–99 percent of women are immunized for tetanus during pregnancy. The UNRWA also found 95–99 percent of births are attended by trained personnel. The maternal mortality rate in Palestine is 45 deaths per 100,000 live births (WHO 2016). UNICEF is in the process of rehabilitating neonatal units throughout Palestine, with the hope that it will improve newborn survival rates. In 2012, the infant mortality rate (under the age of one) was 19 per 1,000 live births, and the neonatal mortality rate was 13 per 1,000 live births. In 2010, the lifetime risk of maternal death was 1 in 330. Women are covered for antenatal care as well as skilled attendance at birth (UNICEF 2016).

Employment

The workforce in Palestine predominantly consists of men. In 2013, the workforce included more than 1.1 million people. However, only 16.6 percent of Palestinian women are in the workforce, while 68.7 percent of men are. The labor force participation of Palestinian women is one of the lowest in the world. Many Palestinians are out of the workforce due to high unemployment rates. In 2013, the unemployment rate in Palestine was 24.5 percent—and growing. The high unemployment rates can be attributed to stagnant gross domestic product (GDP) growth, increasing political instability, restrictions on economic activity, and military conflict. Women face extreme barriers to employment in upper-level positions. Only 1.2 percent of the firms in Palestine have a female top manager. Gender-based violence in the workplace is also beginning to be recognized. In a survey conducted by the International Labor Organization (ILO), nearly 23 percent of women have experienced violence in the workplace (ILO 2016).

Typical Jobs and Careers

Palestine has traditionally had an economy based on agriculture, with many Palestinians working as farmers, growing olives, sesame seeds, and cotton. After Europeans came to Palestine in the 19th century, Palestine shifted to a market-based economy focused on importing and exporting. Oranges and other citrus fruit are their primary exports, along with sesame seeds, barley, and durum wheat.

Discrimination and Income Disparity

According to the Palestinian Labor Law, it is prohibited to discriminate in employment based on someone's gender.

Pay Equity

In Palestine, there is a significant gender pay gap. Women's median daily wage is 84 percent of men's. In the manufacturing sector, there is an even greater pay gap, with women being paid only 57 percent of the median wage of men. The gap is also seen in recent graduates starting their first private-sector jobs, where there is a 20 percent gender pay gap (ILO 2016).

Maternity Leave

Women in Palestine are entitled to 10 weeks of paid maternity leave. Most employed women use the full maternity leave period.

Family Life

Family plays an important role in the lives of Palestinians. Members of a household typically work in the same economic fields and participate in social activities together. Three distinct family types have been found in Palestine: the extended family, the nuclear family, and the transitional family.

The extended family is the most common family type and is the traditional family form in Palestine, with multiple generations of a family all living within one home. The extended family consists of three or more generations, usually consisting of the descendants of a grandfather and their wives and kids. This family type is based on communal cooperation, with all members of the family household playing an important role in family life. The extended family form is common in both the West Bank and refugee camps in the Gaza Strip.

The second family type found in Palestine is the nuclear family. The nuclear family consists of a married couple and their unmarried children. This is an emerging family form in Palestine that is becoming more common, particularly in the West Bank.

The third family type in Palestine is the transitional family. This family type shares characteristics of both the extended and nuclear family types. The transitional family consists of a married couple and their unmarried children, as well as some members of the extended family. The

transitional family type can be found in rural portions of the West Bank as well as in the Gaza Strip.

Sexuality

Sexual education takes place in primary and secondary schools and is based on a curriculum created by the Ministry of Health. Sexuality and sexual health are considered taboo subjects. It is common for adolescents to be punished if they are discovered talking about them. Women are expected to be virgins until marriage, so teenage pregnancy is not common. If it is found that a young woman has “disgraced” her family through having sexual affairs outside of marriage, an honor killing may be performed by the woman’s family.

Marriage and Fertility

Traditionally, marriage has been between young men and women that are related, frequently being parallel cousins. This type of marriage is still common in villages and refugee camps. Marriages have traditionally been arranged by the fathers of the bride and groom, and the weddings are often quite elaborate. The ceremony typically involves the families, extended relatives, and others from the village. Traditional wedding ceremonies take place over three or more days, with celebrations at both the bride’s and groom’s homes. Weddings are joyful and include dancing, food, and celebration.

Many Palestinians marry at young ages; however, the prevalence of youth marriage is declining. From 2002 to 2012, 20.6 percent of children were married by the age of 18. In the West Bank, the legal age for marriage is 15 for females and 16 for males. In Gaza, the legal marrying age is 17 for females and 18 for males. Polygamy is legal but rarely practiced. The total fertility rate in Palestine is 4.9 according to 2009 estimates (WHO 2016).

Divorce

Divorce is allowed in Palestine in instances where a spouse has failed to fulfill his or her duties. Muslim men are able to divorce their wives without reason, while women can only initiate divorce under limited circumstances. If a woman seeks divorce without providing evidence, she must return her dowry and give up any financial rights, but the divorce is only possible if the husband agrees. Divorce is not socially acceptable and is frowned upon in Palestine, which causes many couples to remain married

when they no longer wish to be. It is rare for a woman to remarry because of the cultural tradition that a woman is a virgin at marriage. The father is the legal guardian of any children. In cases of divorce, women may be given custody of their daughters until they turn 12 and their sons until they turn 10.

Household Roles and Responsibilities

It is the duty of women and girls to care for the house, while men contribute by working outside the home. Women cook, keep the house clean, and care for children. Men contribute to the family’s financial well-being. Children help their parents as the parents see fit.

Inheritance

Females usually receive a smaller inheritance than males. This can be attributed to both tradition and Islamic sharia law. According to Islamic law, if a husband dies childless, the wife is entitled to a fourth of the husband’s estate. If he had children, the wife is entitled to an eighth of his estate. Daughters receive half the inheritance that their brothers do. If the father just had daughters, the daughters’ inheritance would be equally divided among them. If a daughter marries, it is expected that she will relinquish her portion of the inheritance to her brothers.

Gender Roles and Family Structure

Palestine has many different gender roles in the form of both laws and traditions. Many of these roles are based on Islamic law. Girls are expected to keep themselves covered, only showing themselves to their families, based off teachings in the Koran. Because of this, girls generally stay at home and participate in few public activities. Required covering is followed more strictly in rural villages and refugee camps, where many girls do not even attend school. Young Palestinian children typically have unstructured daily schedules.

Contraception

Contraception is widely known about in Palestine, with an estimated 98 percent of women familiar with the different methods. In 1999, the Ministry of Health estimated that 54.8 percent of women use contraception. Abortion is only legal if the life of the mother is in danger.

LGBTQ+ Rights

Most Palestinians are not supportive of people identifying as LGBTQ+. Most LGBTQ+ Palestinians do not reveal their sexuality to their families, frequently choosing to stay closeted and marry a heterosexual partner. Many LGBTQ+ Palestinians will marry cisgender heterosexual spouses, even if they do not love the person, because homosexuality is strongly opposed in the territories. There are no laws criminalizing homosexuality in Palestine, but there are no laws to protect LGBTQ+ people. No legislation is in place to protect people from being fired due to their sexual orientation or gender identity, nor are there any laws saying hiring discrimination for that reason is illegal. In addition, there are no laws prohibiting violence against LGBTQ+ people. There is little documentation for LGBTQ+ Palestinians being victims of violence or killings, but that is likely due to most of these people living closeted lives. Same-sex marriage is not legal in Palestine.

Politics

Judicial System

Women are present in the judicial system, but there are few of them. According to a 2010 World Bank report, 12 percent of judges and 11 percent of general prosecutors are women. Female lawyers face discrimination when entering both state institutions and private legal practices.

Participation in Government

Under the Palestinian Basic Law, both men and women in Palestine have equal voting rights and the same right to stand for election. Women were first able to exercise this right in 1996, in the first election to the Palestinian Legislative Council. Following the 2006 elections to the Palestinian Legislative Council, women occupied 14 percent of the seats (World Bank 2010). Women's rights groups in Palestine have organized training for women to support their political participation.

Women's Associations, NGOs, and Nonprofits

The Women's Affairs Technical Committee (WATC) is an active women's rights group that was formed by multiple women's organizations in Palestine. The WATC, along with other women's groups, has been lobbying the Palestinian Legislative Council for gender equality and to reform discriminatory laws. These groups have also lobbied for an

increase in women's representation in decision-making bodies.

Suffrage

All Palestinians over age 18 are allowed to vote. Women first voted in Palestine in 1920, following a highly active suffrage movement.

Personal Status Laws

In the West Bank, the Jordanian personal status law of 1976 applies, and in Gaza, the Egyptian personal status law of 1954 is used. The laws are based on Islamic teachings. These laws have been amended over time to remove some of their discriminatory aspects. However, the laws still say that a woman is only worth half that of a man in inheritance, marriage, divorce, and child custody cases.

Citizenship and Nationality

Citizenship is governed by the laws that were in effect prior to the Israeli occupation in 1967. The Jordanian nationality code is applied in the West Bank, and the Egyptian nationality code is applied in Gaza. Women do not have the right to pass their nationality to their children and spouses. Palestinians living in Israel or who are Israeli citizens have additional citizenship challenges. Palestinians from the occupied territories who are married to Palestinians who are permanent residents of Israel or are Israeli citizens are not allowed Israeli citizenship or residency, forcing many Palestinian families to live separately.

Religious and Cultural Roles

Women's Roles

Women have highly defined roles in Palestine's Islamic community. Women are responsible for supporting their husbands and families and running the home, while men are expected to provide for their families financially. It is expected that women will dress modestly so that their beauty will only be exposed to their husbands or families. Many women choose to cover themselves because it allows them to enter public spaces freely. However, fewer women are covering their heads and faces now than they did in the past. There are no laws to punish women who choose not to cover themselves. Women are expected to follow the sharia law, particularly as it pertains to personal status laws.

Issues

Violence

Violence is a reality of life for many Palestinians. The high prevalence of violence is due to the ongoing conflict and war, high unemployment, overcrowding, overpopulation, the high fertility rate, and other social pressures. Witnessing and experiencing violence has caused many Palestinians to develop detrimental physical and psychological health effects. There are many organizations in Palestine that provide mental health services due to this.

Impact of Conflict on Women's Lives

Ongoing conflict in Palestine has had a huge effect on women's lives. Most women have had family, friends, or others they know be killed or harmed as a result of the conflict. In many instances, it was witnessed firsthand. Many women and children are held as prisoners, beaten, or shot due to being Palestinian. Women are particularly targeted by Israeli aggressors. There have been documented cases where women were not able to cross checkpoints to go to hospitals or medical facilities, which has resulted in women dying. Women are increasingly becoming more involved in conflict as well, as seen by women suicide bombers and hijackings.

Domestic Violence

Violence is a regular occurrence that Palestinians, especially women, encounter. Husbands frequently beat their wives. This form of domestic violence is common, likely because it is supported by the gender roles and expectations that are present in marriage in the Palestinian society. There are currently no laws in Palestine that protect women from domestic violence or that make it illegal. The penal codes in Jordan and Egypt allow leniency in sentencing for men who kill their wives due to the wife committing adultery. In the West Bank, there are three shelters for women who are victims of domestic violence, while there are none in Gaza.

Sexual Assault and Rape

The only law in place against rape states that rape is a crime, but the perpetrator can avoid punishment by marrying his victim. There are no laws in Palestine against spousal rape. Rapes often go unreported due to social pressures against women having premarital or extramarital sexual contact.

Many rapes go unacknowledged because doing so would reflect poorly on the woman's family.

Gender-Based Violence

Gender-based violence has been particularly apparent during the conflicts between Palestine and Israel. Palestinian women are frequently held as prisoners in Israel in dire conditions that violate the women's basic rights.

Sexual Harassment

At present, there is no legislation to protect women from sexual harassment, either in the workplace or outside of it.

R

Republic of the Congo

Overview of Country

The Republic of the Congo, also referred to as Congo-Brazzaville, is a Central African country that borders the South Atlantic Ocean, between Angola and Gabon. It is sometimes confused with the neighboring Democratic Republic of the Congo, but the two are distinct countries with their own unique histories. Recurrent civil wars have affected the country, but the Republic of the Congo is not exclusively defined by the legacy of this conflict.

Although the Republic of the Congo covers an area of 132,047 square miles, approximately 60 percent of the more than 4.6 million inhabitants live in urban areas. Much of the population is concentrated in the capital city of Brazzaville, the coastal city of Pointe-Noire, or along the railroad between them. This highly urbanized country had a population growth rate of 1.94 percent in 2014, the 55th highest in the world (CIA 2014).

The population of the Republic of the Congo is young, with children under 14 years of age making up 41 percent of the Congolese population, adults between ages 55–64 making up 3 percent, and adults over 65 years of age making up just 2.7 percent of the population. At 40.1 births per 1,000 in 2012, Congo ranked 10th highest in the world; however, life expectancy is among the 30 lowest in the world at an average of 55.27 years at birth. Life expectancy

is slightly higher for Congolese women, at 59.7 years, compared with 57.38 years for men (CIA 2014).

French is the official language of the Republic of the Congo. Other main languages include Lingala and Mono-kutuba, and there are many additional local languages and dialects (CIA 2014). The country is also home to many refugees from the neighboring Democratic Republic of the Congo as well as from Rwanda and Burundi, among others.

There are four major ethnic groups, with the Kongo people—a Bantu ethnic group—representing 48 percent of the population. Additional ethnic groups include the Sangha, the M'Bochi, and the Teke (CIA 2014). The Congo Basin is also home to the indigenous group historically referred to as “Pygmies,” although some consider this term imprecise or pejorative. With such a high percentage of the population concentrated in urban centers, the Republic of the Congo's indigenous and rural populations can encounter difficulties in accessing goods and services.

Catholicism is the dominant religion in the Republic of the Congo. In 2010, 33.1 percent of Congolese were Roman Catholic, followed by Awakening Churches/Christian Revival and Protestant for a combined just more than 40 percent. Approximately 2 percent of the population is Muslim, and the remaining Congolese cite indigenous African beliefs or no religious affiliation (CIA 2014).

Civil unrest, civil wars, and militia conflicts have plagued the Republic of the Congo and affected the

position of women. For the 2014 Gender Inequality Index (GII), the country received a score of 0.617, placing the Republic of the Congo 135th out of 152 countries with data (UNDP 2014). Although the country became a party to the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) in 1982, its place in the GII suggests that gender inequalities in such measures as reproductive health, empowerment, and labor market participation persist.

Girls and Teens

According to Congolese law, women and men have equal rights in education, employment, political participation, and family relations. However, there is evidence to suggest that women have yet to realize full equality in all aspects of economic, social, and public life. The disparities can be further emphasized for rural and indigenous women and children. Ethnic and political unrest have left Congolese women in a tenuous position, although the overall situation does appear to be improving for girls and teens who are somewhat further removed from the direct effects of the conflicts. To some extent, particularly in rural areas, the weight of tradition appears to continue to influence the development of girls and their eventual ability to be full participants in decision-making processes.

The structure of Congolese society has been such that it was common for girls to spend much of their early lives around other women. Under this relationship, girls acquire their knowledge about sex and sexuality through their networks of sisters, mothers, and women in their extended families and communities. However, some educational needs may not be met effectively through family networks if accurate or comprehensive sexual and reproductive health information is limited. For example, complete knowledge of and access to options for protection from sexually transmitted infections or to family planning resources can vary greatly across networks.

Female genital cutting (FGC) is illegal, but the practice is still known to occur in some immigrant communities and indigenous populations (U.S. Department of State 2014). The practice is a concern for some nongovernmental organizations (NGOs) interested in addressing human rights and ending violence against women. In its 2012 report, CEDAW made a strong statement, calling for the Congolese government to address what is described as the “harmful traditional practice . . . [of] female genital mutilation” (CEDAW 2012, 5). Despite this call, there has not

been a systemic effort to address ongoing concerns about the practice, especially in rural areas.

Education

Education is compulsory and universal until the age of 16. There is no cost for tuition, but families are responsible for the indirect costs of education, such as books, uniforms, and school fees. Enrollment is higher in urban areas, as rural youth may be lacking their required birth certificates. Registration is necessary for school enrollment; however, parents must request birth registration for a child, and office locations are limited to provincial capitals. This has a particularly negative impact on the indigenous minority and rural populations.

All Congolese children have access to free public education; however, many of the country's schools were destroyed during the 1997 civil war. Where schools have been rebuilt, persistent structural and cultural barriers to education can still exist for girls and young women.

Girls and boys attend primary school in approximately equal numbers, but disparities begin to emerge at the high school level. At the primary level, the overall ratio of girls to boys ranges between 84 to 100 and 96 to 100, but by the upper secondary level, the range is between 43 to 100 and 55 to 100. At the university level, the ratio is 19 to 100 (CEDAW 2010). Recent data indicate that 43.8 percent of women have completed at least a secondary education, compared with 48.7 percent of men (UNDP 2013).

Trend data suggest that the number of women entering into and graduating from higher education is increasing, but they still lag behind men. A variety of family and social reasons may explain why women do not pursue higher education or why they drop out before completing their degrees. For example, women may marry and begin to have children at an early age. Additionally, some parents are unable or unwilling to support their daughters' pursuit of higher education. Particularly among families with limited resources, the educational advantages may be afforded to sons over daughters (CEDAW 2010).

Literacy

The total literacy rate for the country is 83.8 percent; however, 89.6 percent of males over the age of 15 can read and write versus 78.4 percent of females in 2003 (CIA 2014). Disparities in literacy rates are even more pronounced in rural areas.

Health

Access to Health Care

The Congolese Association for Family Well-Being opened in 1987 as a small operation focused primarily on the sexual and reproductive health needs of the urban poor. The association is a full member of the International Federation for Family Planning, and over the past nearly 30 years has grown to a network of more than 100 community-based distributors providing a range of services, from family planning and prenatal care to prevention and management of HIV/AIDS. Their mission focuses on promoting and protecting individual rights as well as improving access to quality services (IPPF 2014).

Maternal Health

The Act of 31 July 1920 prohibits both abortion, except when pregnancy poses a danger to the mother, and the advertising of contraception. The contraceptive prevalence rate is 44.7 percent in 2011, which indicates that less than half of women considered to be of reproductive age, or between the ages of 15 and 49, who are married or in a union are using or have sexual partners who are using contraception (CIA 2014). There are no legal restrictions on the right to access contraceptives, and the availability of free contraceptives has been a particular focus of the anti-HIV efforts of NGOs. However, cultural taboos and concerns about the negative long-term impact are cited as reasons why use is not more widespread.

The persistence of this law criminalizing abortion can have the effect of leading women to seek unsafe and illegal methods of terminating a pregnancy (CEDAW 2012). However, efforts are underway to address the customs that some point to as restricting women's access to health care, the impact of poverty and illiteracy on understanding risks and resources, and the uneven distribution of health clinics and health workers (CEDAW 2010).

The mean age of Congolese mothers was 19.8 in 2011, and the total fertility rate was 4.73 children born per woman in 2014 (CIA 2014). The infant mortality rate was 74.22 per 1,000 live births in 2012, and the maternal mortality rate was 580 per 100,000 live births in 2008, both of which are considered quite high by global standards (Boslaugh 2013, 110). However, the Government of the Congo has started the process of enhancing the provision of quality health services with the aim of reducing maternal and infant mortality. This includes ensuring that

women have access to resources and services regardless of their income. Additionally, medical monitoring for pregnant women by doctors, nurses, and midwives has helped to reduce the infant mortality rate from 900 deaths per 100,000 live births in 2002 to 781 deaths per 100,000 live births in 2005 (CEDAW 2010). In 2006, approximately 75 percent of pregnant women received at least four prenatal visits, and nearly 94 percent of births were attended by skilled health personnel (Boslaugh 2013, 109). A majority of these births took place in a health care institution with a skilled birth attendant, although women living in rural areas more frequently give birth at home than women living in urban locales.

HIV/AIDS

The human immunodeficiency virus and acquired immune deficiency syndrome (HIV/AIDS) epidemic directly affects the lives of Congolese women, whose social status can put them at particular risk of infection. The number of people living with HIV/AIDS is approximately 74,500 in 2013, ranking the Republic of the Congo 52nd in the world (CIA 2014). Individuals who are infected may continue to experience social stigmatization and discrimination. In 2001, HIV/AIDS was estimated to be the leading cause of death among 19- to 45-year olds (Reproductive Health Response in Crises Consortium 2001). In its 2012 report, the Committee on the Elimination of Discrimination against Women cites the number of women infected with HIV/AIDS as disproportionately high, making the epidemic a prominent social issue for women (CEDAW 2012).

As part of the country's proactive efforts, anti-HIV/AIDS campaigns have been developed to create greater access to free or low-cost antiretroviral therapy (ART) for those Congolese who are living with the disease. The Republic of the Congo is also home to a National Anti-AIDS Council and has a number of NGOs working to reduce transmission and increase services.

Employment

With 68.4 percent of women aged 15 and older participating in the labor force in 2012, compared to 72.9 percent of men, the gender disparities in labor force participation rates are minimal (UNDP 2012). However, data do not appear to be readily available to determine whether there are any disparities in participation rates by ethnicity.

The overall unemployment rates are relatively high, and women in rural areas are particularly limited in their access to wage employment. In 2012, the unemployment rate was 53 percent, placing the Republic of the Congo 196th out of 203 countries worldwide (CIA 2014).

Although there are laws setting 16 as the minimum age for employment, child labor practices persist, particularly in rural areas and in the informal sectors of the economy that operate outside of formal government oversight. Human rights reports estimate that more than half of child laborers are girls engaged in domestic work under harsh conditions for little or no pay (U.S. Department of State 2014). Reports indicate that, in many of these situations, girls from rural areas leave their homes to find work with urban families.

Job and Career Opportunities

The labor market in the Republic of the Congo remains segregated by sex, with women concentrated in teaching, health, and agriculture. The Congolese economy is mainly based on oil and timber, and with few other well-developed resources, the economy is not considered very stable or diversified. The Republic of the Congo is one of the region's main oil producers and is ranked the fifth largest in sub-Saharan Africa, although the abundance of offshore oil has been both a source of wealth and conflict.

While the country's gross domestic product (GDP) has seen slight improvement since 2002, due in part to rising oil prices, overall economic growth has been in decline, as has the per capita income (CEDAW 2010). A decade of conflict leading to a postwar increase in the number of women-headed households left Congolese women and children particularly vulnerable to the effects of widespread poverty. In 2001, per capita income for women was at just 54 percent of that of men, and an analysis of food assistance distributed in Brazzaville indicated that women-headed households were the primary recipients of aid (Reproductive Health Response in Crises Consortium 2001). In 2005, the Republic of the Congo was identified as "severely indebted" (Seager 2009).

In addition to oil, agriculture is another important economic activity, making up approximately 11 percent of the country's GDP. Main crops include cassava, sugar, rice, corn, coffee, and cocoa; however, agricultural production is insufficient to meet the country's needs, which requires that foods such as meat, dairy products, and grain be

imported. Women and children play a significant role in agriculture, from planting through harvesting and selling agricultural products. While some of women's agricultural labor focuses on the sustenance of their children, husband, and extended family members, Congolese women are also engaged in market transactions. In 2010, the agricultural sector was made up of approximately 70 percent women, although they own only approximately 25 percent of the land (CEDAW 2010).

Yet, because of the low pay associated with agricultural work, Congolese women remain impoverished. Such poverty is one of the main reasons why women are less likely than men to have ownership of and access to land. The primary means by which women do have access to land include inheritance and marriage, but without those paths to ownership, women often face difficulties in obtaining the credit necessary to purchase property on their own. In instances of shared property, when a woman's husband dies, the property will be divided in half, with the wife retaining 50 percent and the remaining land distributed between children and other family members (CEDAW 2003).

While there is growing demand for technical and vocational skills, the education system is not yet well-developed, and women's participation in the opportunities that are available lags behind their male counterparts. While girls make up 58.55 percent of the total attendees in technical secondary school, their participation rate drops to 43.37 percent in the upper secondary cycle. Women are better represented in vocational training schools, particularly in the fields of health and education, where they account for 70.9 percent of the total students (CEDAW 2010). Congolese students in rural areas are at a particular disadvantage because over half of the schools are concentrated in the more populous urban centers of Brazzaville and Pointe Noire.

Pay

The Republic of the Congo has legal provisions providing for equal pay for equal work. However, while laws prohibiting discrimination based on gender include the right to equal pay, human rights reports point to continued economic discrimination. Part of the gendered wage gap can be attributed to the concentration of women in the informal sector of the economy, where they may work as street vendors or in other unregulated environments and where

the lack of government oversight also means they have little or no access to employment benefits.

Women also face barriers in accessing formal financing. Instead, they are turning to microfinancing institutions with greater frequency. Women have an increasing number of options for accessing low interest rate loans through savings and credit banks aimed exclusively at women. Some data indicate that 93–99 percent of these loans are paid back (CEDAW 2010). Such organizations along with the Congolese government also aim to improve the capabilities of women by providing training in areas that will support their income-generating activities.

Sexual Harassment

In its 2012 report on the Republic of the Congo, the Committee on the Elimination of Discrimination against Women cited as problematic the prevalence of sexual harassment in the family, at school, and at work. Further, the report called for the adoption of legal provisions prohibiting sexual harassment (CEDAW 2012). Although the phenomenon is not unique to the Republic of the Congo, the lingering effects of periods of conflict combined with the country's consistently low rank in the GII may warrant particular attention to the persistence of sexual harassment.

Maternal Leave

The Republic of the Congo has provisions allowing paid maternity leave. By law, women have access to paid maternity leave of 105 days, to be paid at 100 percent of wages (International Finance Corporation 2014). Despite these benefits, Congolese women who experience frequent absences from work because of their reproductive role may find themselves with unequal access to employment opportunities because employers consider absenteeism a sign of decreased commitment to the workplace.

Child Care

Structural support for working Congolese women who have children is limited. The provision of child care has been described as inadequate, and many women have limited resources to pay for the support their families need. Instead, women who are able to do so often rely on the support of extended families and communities. Support for mothers and children is an important component of improving the lives of women, and more research is needed about the particular challenges working Congolese

women may face in also effectively managing their responsibilities as mothers.

Family Life

Marriage

The legal age for marriage is 18 years for women and 21 years for men. These age limits are set by the Congolese Family Code (Article 128). While the law prohibits child marriage, both sets of parents can give permission for marriage at an earlier age; no minimum age is specified for such cases (CEDAW 2010). Described as “pre-marriage,” the practice of promising marriage allows for cohabitation and a sort of de facto marriage before the individuals involved reach the minimum age. Levirate is also practiced in the Republic of the Congo, which is an arrangement through which a widow is obligated to marry her deceased husband's brother. In its 2012 report, CEDAW cites both of these traditional Congolese practices as harmful to women and children who may lack legal protections against violence and exploitation in the context of marriage, and the committee calls for legal prohibitions against pre-marriage and levirate (CEDAW 2012).

The Republic of the Congo is described as allowing for the practice of polygamy, but the practice in the country is more accurately characterized as polygyny. That is, Congolese men may marry more than one woman, but that option is not open to women. However, Congolese women in or entering into monogamous unions have the legal right to decline to give their consent to additional wives not agreed to before the marriage. A revision to the original marriage contract is required in instances when the first wife does consent to additional wives (CEDAW 2003).

While Congolese law extends equal rights to a divorce to men and women, women in rural areas can be impeded by interpretations of dowry and inheritance laws that make divorce difficult in practice (Reproductive Health Response in Crises Consortium 2001). Additionally, there are disparities with regard to laws governing adultery. As of 2003, Congolese women accused of adultery were subject to imprisonment, often for a period of a few months to over two years. However, men accused of adultery were simply ordered to pay a fine (CEDAW 2003). This is an example of some of the inequalities that persist despite an overall commitment to ensuring gender equality.

Within the context of Congolese society, marriage is typically not seen as an end in itself; rather, an emphasis is placed on bearing children. Particularly for women, social worth and long-term security are acquired and maintained through motherhood. Although in wealthier countries the average number of people per household has declined to 2.8, in the Republic of the Congo, the average as of 2006 was over 6 people per household (Seager 2009). Given the emphasis on large families, it is not surprising that to some Congolese not having children is considered socially and potentially economically devastating for women and could be considered grounds for a divorce (Martin 2009).

Sexuality

While it is legal to be gay in the Republic of Congo, there are no legal protections against discrimination against gay individuals. Marriage between same-sex couples is not legal, and social stigma about homosexuality prevents reporting and collecting accurate information about this community and the challenges it faces.

Household Roles and Responsibilities

The contributions of Congolese women to the household economy have historically focused on work, including cultivating and preparing food, such as rice and cassava, to sustain their families; transporting water and firewood; and raising children. The labor associated with men has included such work as hunting, clearing land, and growing crops such as tobacco and sugarcane. While some women and men engage in collaborative work, much of the perpetuation of a division of labor has been based on cultural beliefs about gender (Martin 2009). Gender divisions of labor are also perpetuated through matrilineal succession, where mothers acquire knowledge of cultural practices from older women and then pass on this practical knowledge to their own daughters.

Politics

Middle Congo, as it was known then, is a former French colony that gained independence in 1960. Fulbert Youlou (1917–1972) became president of the newly independent Republic of the Congo, but he resigned three years later amid worker unrest.

Subsequent leaders experimented with the ideas of Marxism, and the Congolese Workers Party was declared the sole legitimate party in 1970. Marxist theories were

abandoned in the early 1990s amid the difficult economic times following the Cold War, and the initial transition from a single-party state was peaceful as a democratically elected government took office in 1992 with Pascal Lissouba (1917–) as president. However, civil unrest began almost immediately after he assumed power, in part due to perceptions about his approach to leadership and ability to unify the country and also due to concerns about the overall strength of the economy.

Five years later, in 1997, ethnic and political tensions became heightened and led to civil war, during which time an estimated 800,000 Congolese citizens were displaced (Reproductive Health Response in Crises Consortium 2001). The civil war lasted just four months, ending when Lissouba fled and former single-party president Denis Sassou-Nguesso (1943–) resumed the presidency. Sassou-Nguesso, who was previously president from 1979 to 1992, remains in the position today, making him one of Africa's longest-serving leaders.

In 2009, Sassou-Nguesso was reelected to a seven-year term by 78 percent of the vote, but some opposition candidates and NGOs expressed concerns about whether the election was in fact free, fair, and credible (U.S. Department of State 2014). Sassou-Nguesso's party, the Congolese Labor Party, currently holds most of the senior government positions, and the World Bank's 2012 Worldwide Governance Indicators cite corruption as a severe problem within the country.

While the participation of women in formal government positions may be limited, Congolese women are active in shaping the political landscape of their country. For example, the lingering impact of economic and political instability along with civil unrest has led to the creation of active peace movements. In 1998, thousands of women participated in a demonstration for peace in the capital city of Brazzaville, and subsequent efforts have included planning conferences and creating peace organizations (Martin 2009).

Many of the women involved in movements for peace are drawn to these efforts both through their identity as mothers and through their involvement with the Catholic Church. However, their work has not always been met with encouragement by political leaders, including President Sassou-Nguesso. His closing comments at a conference for Catholic mothers involved in peace movements in Central African countries left some participants feeling discouraged by a message they thought relegated them to the domestic sphere rather than encouraged to engage in political movements (Martin 2009).

Rights

In addition to becoming party to the CEDAW, the government of the Republic of the Congo has attested to the importance of equality by ratifying the Optional Protocol to CEDAW, the Protocol to the African Charter on Human and Peoples' Rights on the Rights of Women in Africa, the Convention on the Rights of the Child, and the Solemn Declaration on Gender Equality in Africa. The Republic of the Congo has taken steps through various forms of legislation to mitigate gender inequities.

Additionally, gender equality is formalized in Article 8 of the Constitution approved in 2002, which states, "All citizens shall be equal before the law. Women shall have the same rights as men." A related article on political parties calls for the advancement and representation of women in political, elected, and administrative offices (CEDAW 2010). The law establishes full legal capacity for women, whatever their marital status. Gender is also identified as a protected status in prohibitions against discrimination, but *de facto* inequalities persist by way of cultural practices that favor men and create barriers to the advancement of women. Where they exist, harmful cultural norms, practices, and traditions and deep-rooted stereotypes serve to limit the full empowerment of Congolese women. Presently, the law does not prohibit discrimination based on sexual orientation or gender identity.

The Congolese government established a national body responsible for the advancement of women, the Ministry for the Advancement of Women and the Integration of Women in Development. The ministry works closely with partners such as NGOs on a wide variety of work related to the advancement of women, including supporting funding, promoting the development of organizations, and publishing statistics. The ministry also works with other ministries to ensure the consideration of the lives and needs of women in other ministries' programs. The actions of the Ministry for the Advancement of Women and the Integration of Women in Development have included such topics as developing women's professional skills, addressing violence against women, and preparing women candidates for elected positions (CEDAW 2010). Additionally, in a 2012 report, CEDAW noted that one significant need is to enhance women's own awareness of their rights. Another need is to increase the percentage of the national budget allocated to the empowerment and advancement of Congolese women (CEDAW 2012).

Participation in Government

Congolese women's participation in government has progressed slowly at all levels, from city-level positions to national decision-making bodies. In its 2010 report, CEDAW identified such barriers to more equal representation of women as social and cultural prejudices, sufficient economic power, and persistent violence against women (CEDAW 2010).

The current institutional framework includes a presidential system and the separation of powers into three branches of government. There are few women in leadership positions in the Republic of the Congo's political system. The positions of chief of state and head of government have never been held by a woman, and the Council of Ministers appointed by the president is predominately composed of men. The two-chamber legislature is made up of the National Assembly and the Senate. In 2007, an electoral law was adopted establishing a 15 percent quota for women in the Senate and National Assembly (CEDAW 2012). After the 2012 elections, women held 7.2 percent of the seats in the Senate and 10.7 percent of the seats in the National Assembly. From 2002 to 2006, Congolese women held approximately 14 percent of the seats on the Supreme Court and 8.55 percent of the seats on local councils (CEDAW 2010).

Religious and Cultural Roles

A significant portion of Congolese are Catholic, which exemplifies the lingering influence of colonial Congo. However, the church is also a site of both spiritual and social fulfillment for Congolese women, and now Catholic women outnumber men in the postcolonial church (Martin 2009).

Issues

The U.S. Department of State and Amnesty International have both reported on such human rights abuses as discrimination against women, sexual and gender-based violence, and trafficking in persons (U.S. Department of State 2014). In 2012, the Republic of the Congo was ranked 142nd out of 186 for the Human Development Index (HDI) (UNDP 2012). This measure evaluates long-term progress in regard to life expectancy and health, access to education, and per capita gross national income. While at certain points in the country's history such issues could be

linked with recurrent civil wars and civil unrest, the problems do not occur exclusively within times of war.

Domestic Violence

According to the 2013 County Report on Human Rights Practices, domestic violence against women is widespread, but it is rarely reported because of cultural taboos (U.S. Department of State 2014). There are no specific legal prohibitions against spousal battery, and matters are most frequently addressed through extended families and villages. At the national level, the Republic of the Congo appears to lack an effective strategy to address violence against women. In its 2012 report, CEDAW made a strong statement in favor of a comprehensive national law on violence against women. This recommendation includes training for police, legal counsel, and health workers who can be engaged to raise awareness about as well as effectively respond to individual and systemic violence (CEDAW 2012).

Rape and Sexual Assault

NGOs estimate rape to be common but note that only a fraction of rapes are reported, largely due to cultural barriers. The government does not provide national figures, so the full extent of the problem is unknown. Additionally, many of the resources are concentrated in the Brazzaville region, which can limit the ability of survivors in rural regions to access adequate resources (Reproductive Health Response in Crises Consortium 2001).

Rape, including spousal rape, is illegal, with the law prescribing 5–10 years in prison for violators. However, human rights reports indicate that the government does not effectively enforce the law, and the penalties for rape more frequently include several months' imprisonment. Sexual harassment is also illegal, but it is similarly rarely reported and ineffectively enforced (U.S. Department of State 2014).

Periods of sustained conflict and instability have increased the prevalence of rape and sexual violence in the region. A period of civil war in the 1990s was particularly devastating, as an estimated 60,000 young women aged 12–15 were raped and forced into service (Houlihan 2011, 328). Yet, comprehensive and reliable data on sexual violence is limited in the Congo as with other conflict-affected regions that have limited infrastructure as well as cultural disincentives to seeking support or making reports. Although the country is not currently experiencing conflict, the effects of sexual violence committed

during previous civil unrest and civil war can linger. For example, years of conflict have displaced many women and girls and led to an increase in the percentage of women-headed households, leaving these populations impoverished, isolated, and more vulnerable to sexual violence.

Trafficking in Women and Children

Despite legal provisions for equality, the Republic of the Congo lacks laws on trafficking. In its 2012 report, CEDAW made a strong statement in favor of a comprehensive national law to address this gap (CEDAW 2012). The Republic of the Congo has been identified as a source country for women and girls who are primarily moved in the global sex trade to South Africa (Seager 2009).

Prostitution is prohibited under the country's Criminal Code, and in 2005, a bill was adopted approving adherence to the Optional Protocol to the Convention on the Rights of the Child on the sale of children, child prostitution, and child pornography. However, prevention measures can be inadequate, and enforcement can be difficult. For example, the strength of the prohibition on establishing brothels is diminished by limited means of effectively prosecuting offenders (CEDAW 2010). The Ministry for the Advancement of Women and the Integration of Women in Development has been working with NGOs to address prostitution, particularly in the populated capital of Brazzaville. Both impoverished and indigenous women and girls are often the most vulnerable to sexual exploitation and trafficking and the least likely to have access to adequate resources (CEDAW 2012).

In its 2010 report, CEDAW outlined a number of strategies the country might take to address the problem of prostitution and support those affected. Proposed measures include studying the extent of prostitution in the Democratic Republic of the Congo, developing enhanced education and communication about the impact of prostitution, and strengthening measures to enforce violations of the Criminal Code (CEDAW 2010). Additionally, there have been specific efforts by NGOs to address the vulnerability to HIV/AIDS for individuals engaged in prostitution. In 2003, the incidence of HIV/AIDS among this population was reported as being as high as 25 percent (CEDAW 2003).

Outlook for the 21st Century

Women in the Republic of the Congo continue to face inequalities in various contexts. For example, family

pressures to enter into marriage at a young age and difficulties in accessing inheritance because of property arrangements that favor men can differentially affect women's lives. Additionally, women remain vulnerable to gender-based violence, and they are subject to discrimination in the workplace. However, the outlook for women is also improving in some areas.

One of the most promising developments for the Republic of the Congo is the increased access to health care for children and pregnant women. For example, the Congolese government has dedicated resources to extending prenatal services to women who previously encountered financial barriers to access. Additionally, in 2013, the World Bank approved funding to enhance health care services for babies and children, including complete immunizations, growth monitoring, and treatment for malnutrition. The investment in improving the lives of children offers some promise for the future of the country.

Republic of Yemen

Overview of Country

The Republic of Yemen is located in the Arab region on the southwest tip of the Arabian Peninsula. Saudi Arabia borders it to the north, and Oman is to the east. The Gulf of Aden and the Arabian Sea are to Yemen's south, and the Red Sea is the coastline to the west. Yemen's coast is approximately 1,500 miles long (2,400 km). The coastal plains rise rapidly into the Al-Surat Mountains, which extend north and east in an L shape. Amid these mountains is the capital of Yemen, Sana'a. To the east and north of the Al-Surat Mountains are highlands that gradually descend to the Empty Quarter. The Empty Quarter (or Rub' al-Khali, "the quarter of emptiness") is a desert that occupies 225,000 square miles (583,000 sq. km), one-fifth, of the Arabian Peninsula. The desert is largely uninhabited, except along the edges. Yemen also has over 200 islands along its coastline, most in the Red Sea.

Yemen has an area of 203,796 square miles (527,829 sq. km). The country is divided into 21 governorates and 1 municipality. The population is 26,737,317, as of July 2015; 99 percent of the people are Muslim, and most speak Arabic. Sunni Muslims are about 65 percent of the Muslim

population, and Shia Muslims are around 35 percent. All the other religions in the country constitute the remaining 1 percent of the total population. These minority religions include Bahá'is, Christians, Jews, and Hindus. There are also a few Muslim minorities, such as Zaidi Shia, Ismailis, and Sufis (CIA 2016).

The UN *Human Development Report* placed Yemen at 160th out of 188 for the Human Development Index (HDI, 0.498). Each of the three indicators has shown improvement (life expectancy, mean years of schooling, and Gross Nation Income (GNI) per capita). The Gender Inequality Index (GII) places Yemen at 155th out of 155 countries because of very few parliamentary seats being held by women (0.07%), few women reaching a secondary level of education (8.6%), and the low rate of women participating in the labor market (25.4%). High rates of maternal mortality and adolescent birth rates also contributed to Yemen's ranking for GII (UNDP 2015). LGBT rights in Yemen are nonexistent. Homosexuality is illegal and punishable with imprisonment. There are no protections for LGBT people.

The markers for human development and gender inequality are only expected to worsen due to the current conflict in Yemen. Since March 2015, Yemen has been in active conflict with Houthi insurgents from within their country and a Saudi-led campaign to stop them from outside the country.

Present-day Yemen was two countries for most of the last century: the Yemen Arab Republic in the north and the People's Democratic Republic of Yemen in the south. These countries were united into the current Republic of Yemen in 1990. Because of unequal access to resources and power, there was a civil war in 1994 and many uprisings in both the north and the south since then.

Currently, the Houthis are seeking to take over the country, and they have taken control of some of the largest cities in Yemen, including the capital, Sana'a. Houthis are part of the Zaidi Shia minority and are named for Hussein Badr al-Din al-Houthi, who led the first uprising in 2004. He was killed, and his family went on to lead several additional uprisings. The Houthis support the prior president, Ali Abdullah Saleh. These forces caused the current president, Abdrabbuh Mansour Hadi, to flee the capital and resign his presidency in February 2015. He quickly rescinded his resignation and asked for Saudi Arabia's help to squelch the insurgency. That campaign began in March 2015 and has since caused an estimated 8,100 casualties, with 2,800 deaths. The people that have been displaced

in their own country by this conflict (internally displaced people, or IDP) is estimated at 2.4 million by the UN Refugee Agency (Al Jazeera 2016). The IDP face significant food insecurity, lack of sanitation, and lack access to health care. Aid organizations are being driven out by deadly airstrikes on their facilities and ground forces that prevent access to those in need.

The contemporary issues for women in this country are exacerbated by the current conflict in Yemen. Primary needs such as food, water, and health care are not being met due to the war. Many schools and hospitals have closed. When families are displaced because of bombing or other violence, these issues worsen, and housing security becomes an issue. Women in combat zones are particularly vulnerable, as rape is a common tool of war. It is not uncommon for girls and women to be taken as sex slaves to service the men fighting. Education and labor force participation was problematic for women in Yemen even before the war. The chance of a woman having a seat at the table with those making decisions, parliamentary seats, is now almost nonexistent.

Girls and Teens

Life for girls and teens has often been ruled by cultural and religious roles. Now it is also affected by destabilized housing, lack of access to such basic resources as food and water, and heightened tensions on the streets and at home—all due to the conflict.

The UN *Global Gender Gap Report 2015* (which looks at the data for 2014, before the war started) ranks Yemen at 145th out of 145 countries (a score of 0.484 where 1.0 is the grade for equality). Several factors contribute to this low rating.

Everyday Life

There is not much information currently coming out of Yemen. Girls and teens in Yemen do not experience the same luxuries as Americans. Schools, hospitals, and government offices are generally closed because of the violence in the country. Living in a conflict zone makes girls and teens more vulnerable to violence in the home and outside of it. Inside the home, there is the stress of not having enough food, water, and medicine. Concerns about safety and security often lead to stress, which contributes to the domestic violence rates. Outside the home, girls are sometimes taken to service armed forces on both sides of the conflict.

The Iron Woman

In 2011, 32-year-old Tawakkol Karman was the first Yemeni, first Arab woman, and second Muslim woman, as well as the youngest person at that time, to win the Nobel Peace Prize. Karman, also called the Iron Woman and Mother of the Revolution, won the prize for spearheading the peaceful struggle for human rights, the safety of women, and contributions toward women's efforts in peace building in Yemen for many years. These efforts snowballed into part of the Arab Spring revolution, which was occurring in several countries at the time.

Karman is a journalist, human rights activist, politician, and mother of three. She founded the organization Women Journalists without Chains (WFWC), which advocates for freedom and rights for the press and provides media skills for journalists. The organization also tracks and produces reports on human rights abuses in Yemen that target journalists. In 2013, Karman was appointed to a United Nations committee to develop Millennium Development Goals (MDG) in the post-2015 period (the year the previous MDGs were to have been met, but weren't).

For Karman's Nobel Peace Prize, she was awarded \$500,000. She donated the full monetary award to the Aid Fund for Families of Martyrs and Wounded in the (2011) Peaceful Revolution. This organization provides aid to people wounded and the families of those killed in Yemen's Arab Spring uprising.

—ReGina E. Kaylor

In general, dress style is limited for Yemeni girls and teenage girls; they must dress conservatively because of Koranic interpretations. There is no dating, and arranged marriages are common. Girls are often married by the time they are 15 years old and have children by 19 years old. LGBT girls and teens are not given the freedom to be who they are. If they do not suppress their sexuality, they can easily become victims of violence by family and society. They do not have legal protections, and their liberty can be taken away for not being heterosexual.

Education

Yemeni girls attend school for a few years but not as long as most boys in Yemen or girls in the United States. Even

for males, only about 50 percent make it to high school, and 14 percent of males go to college, compared to 6 percent of females (World Economic Forum 2015). Girls are pulled out of school to work at home. Only about 35 percent of girls go on to high school, compared to just more than 50 percent of boys. Only 6 percent of teenage girls make it to college. Female literacy rates in Yemen are 55 percent, compared to 85 percent for males. Because of this and cultural gender roles, girls cannot look forward to financial independence. Female participation in the labor force is severely limited; only about 12 percent of women work outside the home in nonagricultural jobs.

When in school, boys and girls sit separately, but they study many of the same subjects that Western students study. In fact, school is structured similarly, with primary grades progressing to high school for a total of 12 years of school. Few students receive the full 12 years of education. Poverty has always been a factor in this.

Education in Yemen is unstable because of the active conflict between the rebels and the Saudi-led coalition. Currently, many of the schools have been closed because of bombings or other violence since the conflict began. IDP are usually not able to participate in school or other systems of social support while they are refugees (World Economic Forum 2015).

Gender is not the only factor affecting who receives an education in Yemen. Yemen is one of the poorest countries in the Arab region. As in many countries, that poverty is worse for some populations than for others. Minorities are more likely to be poor; thus, they are more likely not to receive an education. Rural children also tend to be poor and lack access to educational opportunities. In fact, half of Yemen's population lives in poverty (UNDP 2015).

Even before the conflict intensified in 2015, there were many problems with the educational system in Yemen, from primary level to university level.

Primary and Secondary Schooling

There are several problems with the educational system in Yemen. It is poorly funded, poorly regulated, and has little oversight. Only 40 percent of teachers in Yemen have a bachelor's degree (this degree plus a teaching certificate is the minimum requirement needed to teach in the United States). Teachers sometimes do not show up to teach, and this is not tracked due to lack of local oversight. The conflict affects the attendance of both teachers and students. It is estimated that 1 million children are not attending

school in Yemen; 63 percent of those missing primary school are girls. Lack of funding means that 30 percent of the children who make it to school do not have a desk to sit at. With all these issues at play, only 62 percent of students in the fifth grade were able to read a simple sentence (Guyler 2016).

Most of this information was gathered in 2011–2012, before the conflict intensified in Yemen in 2015. Since that time, schools have been bombed, more families have been displaced, and poverty has increased. The impact of this significant deterioration of the education of Yemen's youth will lead to increased and sustained poverty of the nation. The longer this lapse in education occurs, the deeper the ramifications will be for the country.

College

Universities in Yemen came into being in the 1970s. The first college was built in the Sana'a in 1972, Sana'a University. In 1975, the large southern city of Aden got Aden University. Yemen now has nine universities and a number of private colleges, but they face some of the same issues that the lower levels of education do. Reform is needed to improve and update the academic standards of these educational institutions. Teaching style can be stale and formal, lacking in critical give-and-take discussions that occur in educational institutions in more stable countries. Funding is also needed to improve the limited student capacity of the universities and equip them as necessary. For example, one university science program had to suspend lessons because the laboratory was not equipped with necessary supplies. Textbooks are often out of date, and the libraries can have extremely limited hours (i.e., open two hours a day during class times).

Health

As is the case worldwide, access to and education about health care is not equally distributed over the country's population. Yemen's health care system and health education varies greatly between three main categories: rich and poor, urban and rural, and educated and uneducated. In addition, women are often not free to make their own decisions about their health care; 36 percent of women have their health care decisions made by their husbands, with no say in the matter themselves. Approximately 2.5 percent of women are free to make their own health decisions without interference from a male authority in their lives (Smithson Riniker 2012).

Female genital cutting and mutilation (FGC/FGM) is a common but challenged practice in the Arab and North African regions. This practice is the cutting of a girl's outer genitalia with a blade or scissors, usually in the first month of life. The cutting is rarely done by a medical professional and is illegal. Yemen was one of the first nations where the harm of this practice was recognized. There have been efforts to curtail this tradition and educate the public about the harm that comes from the practice of FGC. Knowledge about FGC has increased in Yemen, but the practice still occurs. FGC is considered a matter of family honor by raising a daughter properly and ensuring she is able to marry. Forty percent of women in Yemen have had FGC (World Economic Forum 2015). The majority of those women live in less-populated areas of the nation, such as the Red Sea and Gulf of Aden coastlines.

Access to Health Care

For the poor living in Yemen, health care is extremely limited. The system is underfunded, with the government only spending 5.6 percent of its budget on health; that is less than USD\$20 per person each year. People in Yemen purchase 95.2 percent of their personal health care from out of pocket, and there are many who cannot afford it. Poor funding of health care also leads to a lack of health care professionals. There are approximately three doctors and seven nurses per 10,000 people (Smithson Riniker 2012).

There are specific organizations that work to offer health care services to the underserved in Yemen. The Akhdam Clinic focuses on the Akhdam minority, which is considered the lowest caste in Yemen and the poorest of the population. The clinic primarily deals with family planning and pregnancy, dehydration and hypertension due to lack of water, and malnutrition.

The Women's Health Care Center is a small private clinic in Sana'a. The for-profit clinic is run by a Yemeni woman and serves mostly upper-class clientele. Contraceptives, family planning, malnutrition, and complications from pregnancy are some of the main issues they handle. The clinic also has a spa connected to it that earns more than the health facility does. This speaks to the financial concerns that keep people from pursuing health care as a career in Yemen.

Marie Stopes International is a nonprofit organization that focuses on women's health, reproductive health, and family planning. It provides contraceptives, pregnancy and postnatal care, and abortions. Abortion is only permitted

in the case of rape, to protect the life of the mother, or in the case of severe fetal congenital abnormalities. Abortion procedures are not taught in medical schools. Marie Stopes offers medical care to those who suffer from suboptimal abortions due to this lack of education.

Doctors without Borders had clinics throughout much of the country, but bombings of these clinics by the Saudi-led coalition has led to the withdrawal of this needed resource.

Maternal Health

The UN Millennium Development Goals (MDG) are set as markers for countries to aspire to in order to improve the lives of their people. Many of the goals apply to maternal and infant health. The MDG for maternal mortality rate is 87.8 deaths per 100,000 live births. Yemen has 385 deaths per 100,000 live births (2015 estimate). The MDG regarding children under five years old is 40.6 deaths per 1,000 children, but Yemen is at 51 deaths per 1,000 children. Infant mortality is at 49 deaths per 1,000 live births (World Economic Forum 2015; CIA 2016). Discrepancies between urban and rural women are significant. By the age of five, rural children are 1.3 times more likely to die than urban children. For poor children, that difference rises to 2.2 times more likely to die by five years old. The reason these rates are so high is the lack of competent medical attendance during childbirth. Only 45 percent of births are attended by health professionals. When location, wealth, and education are taken into consideration, the number of attended births for those who are less privileged decreases significantly. Few women (only 14%) have more than four postpartum medical visits (Smithson Riniker 2012).

The specific clinics listed above provide a great deal of female health care, including prenatal care. Many of the clinics in Yemen are located in urban areas, leading to greatly reduced access for rural women. Also, as discussed, health care is largely an out-of-pocket expense; poor women cannot afford it. Education is also a large factor in women's health, especially concerning family planning and contraceptive use. These two elements of reproductive justice are greatly affected by education, and they are the two elements that most contribute to the health and well-being of women. Fertility rates are a measure of well-being and equity in society. When gender inequity and lack of education are addressed, fertility rates drop, and the health of mothers and children improves.

Diseases and Disorders

According to the *CIA World Factbook*, the risk for contracting a major infectious disease in Yemen is high. These can include schistosomiasis from being in water; malaria and dengue fever from mosquitos or other similar insects; and bacterial diarrhea, hepatitis A, and typhoid fever from ingesting tainted food or water. Cardiovascular disease has a high mortality rate, with 327.1 female and 431.1 male deaths per 100,000 people each year. More men die from HIV/AIDs each year than women, at 5.4 to 3.1, respectively. More men also die from malaria, tuberculosis, malnutrition, cancer, and diabetes. At 51.4 deaths per 100,000 people, women are more likely to die from chronic respiratory disease than men, with a death rate of 47.4. Overall, women tend to live longer than men in Yemen, 67.41 years for women as opposed to 63.05 years for men. Currently, though, many men and boys are being killed and injured in the war, as they are often taken and forced to fight (CIA 2016).

Employment

Given that girls are pulled out of school earlier than boys to work in the home, the clear implication is that work outside of the home is not a female endeavor in Yemen. This is a cultural and religious stance. Of the women who work, most work in agriculture. Women are only 26 percent of the labor force, and they earn merely 27 percent of what men earn when they can work. In the nonagricultural sector, women only hold 12 percent of the wage employment. The number of unemployed women (those who want to be a part of the labor force) is approximately 55 percent. Male unemployment is 12 percent. Only 2 percent of women have accounts at financial institutions; but only 11 percent of men have accounts, so one can view this as a cultural tendency or indicative of the extreme poverty in Yemen (World Economic Forum 2015).

Women in top corporate positions are very few. Two percent of firms have women in top positions. Seven percent have females that participate in ownership of the business. There is a likely connection between the educational level women are allowed to achieve and the level of labor market power they can reach. The women who do work in the labor market are given a mandatory maternity leave of 70 days that is paid by the employer. They receive 100 percent of their wages during this time (World Economic Forum 2015).

Family Life

Many women in Yemen marry young. Approximately 12 percent of girls are married by the age of 15 and 32 percent by the age of 18. Many girls have babies before they reach their 19th birthday (80%) (UN Women 2015). This high fertility rate of 4.1 children per woman explains why girls are pulled out of school to help in the home with housekeeping and sibling care (World Economic Forum 2015). Girls are taught early in life to perform the culturally dictated roles of obedient wife and domestic servant. Nearly 50 percent of marriages in Yemen are between family members, most often first cousins (Smithson Riniker 2012). Polygamy is legal in Yemen, but few men can afford to have multiple wives.

Women are considered to be in charge of the home, but many decisions and rights are denied them. The constitution does state that men and women are equal, but Islamic law is the source of legislation. Islamic law seriously infringes on the rights of women in Yemen. Men can divorce their wives at will. Women have few circumstances that allow them to seek divorce. There are no laws regarding domestic abuse, and marital rape is not against the law.

Few women earn their own wages, and many of those women do feel they have some freedom in determining how to use the money. Inheritance is complex and based on the relationship to the deceased, but women are only allowed to inherit a small portion of what male relatives inherit. Due to a lack of information and education, many women sign off the rights of their property to their husbands or other male relatives.

Within the marriage, men are in charge of the children, and women are merely caretakers. Women have no legal rights regarding their children. In the case of divorce, women may be awarded custody of younger children, but when they get older (12 years for girls and 9 years for boys), they are given to the father's family.

LGBT women are not allowed to marry, to adopt children, or to live an open life as queer. There are no laws protecting them from discrimination or abuse. They can be imprisoned for being openly gay. Their choices can be extremely limited. If they are born into a wealthy family that can provide an education for them, they may be able to achieve financial independence, but this will not give them the ability to live and love in Yemen as heterosexual people do.

Politics

Women in Yemen received the right to vote in 1967 and 1970. These rights were given separately by the Yemen Arab Republic in the north (1970) and the People's Democratic Republic of Yemen in the south (1967) when Yemen was still two separate countries. It is difficult to get recent data on women's voter participation, but in 2003, women were estimated to be 40 percent of the votes. At that time, there were 11 women and 518 men running for office: 1 woman and 300 men were elected (al-Sabeh 2012).

Women are a rarity in government positions in Yemen. The number of parliamentary seats held by women is 0.7 percent (UNDP 2015). There has been no female head of state in the last 50 years.

Yemeni women have been very participatory in political activism, even to the point of placing themselves in front of men facing gunfire from those trying to quell rebellion. Women participate in protests, sit-ins, and voting. Some women courageously pursue investigative journalism to shine a light on the plight of the Yemeni women and families. One such woman is Tawakel Karman, who won the Nobel Peace Prize in 2011. At that time, she was the youngest person to win the award as well as the first Yemeni, the first Arab woman, and the second Muslim woman. Karman wrote about the abuses against journalists in Yemen. She participated in and organized nonviolent protests, and she encouraged journalists to write about the injustices in Yemen. She created Women Journalists without Chains to further her objective to bring peace to Yemen and its people.

Another activist, Amat al-Aleem al-Asbahi, was shot and killed by two motorcyclists in Tai on December 25, 2016. Al-Asbahi was an activist in Taiz for women's literacy. She, along with other women in the area, was limited in her ability to work for what she believed in due to religious fundamentalism. An imam in Taiz issued a fatwa in September 2016, saying women activists were not to mix with men in their efforts. Many women were forced to limit their activist work or do it in secret. Some believe that this fatwa was a factor in the death of al-Asbani. There have been no arrests made in this case, and reporters are not writing about the assassination due to fear of reprisal.

Religious and Cultural Roles

Religious and cultural roles are extremely limiting for the women and girls of Yemen. While the women may be said to be in charge of the home, they have no true

decision-making power. Decisions about finances and the children are made by the husband or, in the absence of a husband, the closest male relative, such as a father or brother of the woman. One of the main roles of a wife is to take care of the husband, physically, emotionally, and sexually.

Religion dictates law in Yemen, and Islam has stringent rules about women's behavior. For Muslims, the main religious day of the week is Friday. On Fridays, men go to the mosque to pray. Women may pray in the mosque in separate quarters from the men or they may pray at home. Modesty is also a main tenet in Islam. Women must be covered from head to toe (often including their faces, except for their eyes), and that is accomplished in different ways, depending on the branch of religion and the region. For many women, this is not accompanied by a feeling of oppression; the covering is considered a demonstration of her faith.

As previously discussed, Yemeni women have little involvement in the world beyond the walls of their homes. There is little employment available for women outside of agriculture. A girl can be married by the time she is 15 years old and start having babies soon after. Culturally, it is expected that the woman will stay in the home, raise her children, and serve her husband. Education can help women rise out of this oppressive system. Currently, most women in Yemen do not learn about sex, family planning, or about their bodies before they are in a marriage bed. When women obtain education in these and other areas, fertility rates are shown to decline. High fertility rates lead to overpopulation and are harmful to infant and maternal health.

Both religion and culture in Yemen are highly heteronormative; any desires outside of heterosexuality are prohibited. LGBT people have fewer choices in pursuit of their happiness than straight people do. People who do not want children also fall outside the teachings of Islam.

Issues

The level of poverty in Yemen cannot be overstated, nor can its severe impact on the people of the country. Beyond poverty, there are further issues that need addressed.

War

The current state of Yemen is not merely one of severe poverty but also conflict. Many of the IDP households

are led by women because many men and boys have been recruited to fight or have been killed or injured in the war. These households are in greater humanitarian crisis due to the almost complete lack of power that women possess in Yemen. These women need to provide food, housing, water, and health care to their families despite being displaced from their homes, and they do not have access to needed resources. They lack access to information about how to acquire the needed resources, about what is going on in their country, and about how to gain the aid they need. Women and girls are also more vulnerable to sexual violence during war, especially when they are displaced from home and family.

The fallout for children is equally dire in the absence of education, which they desperately need. This void in the education of the large school-age population of Yemen will affect the country for decades in its pursuit of equal economic footing with the rest of the world. With an uneducated populace, Yemen will be at a significant global disadvantage. Yemen is already one of the poorest nations in the Arab region, and this conflict is keeping them mired in place.

Refugees fleeing the violence in Yemen go to Oman, Saudi Arabia, Djibouti, Somalia, Ethiopia, and Sudan; some of these countries are facing their own internal wars, straining resources further.

Water

There are no perennial lakes or rivers in Yemen. During seasons of higher rainfall, there are basins and riverbeds that fill up with water, but they are gone again quickly with the hotter summer months. The lack of these perennial bodies of water is just one reason for why Yemen is running out of water. The collection of rainfall has become less common as other methods have been developed for collecting water, such as drilling for groundwater. Poor government handling of water systems is a large issue, and it especially affects rural families. Populous cities, such as the capital of Sana'a, are also suffering. Some have predicted that Sana'a could run out of water as soon as 2017; it will be the first national capital to do so. As it is, households only get running water a few hours a week, and only about 40 percent of the households are connected to a water source at all. Taiz, an industrial city in the southern highlands, may only get water from the taps once a month. In rural areas, girls and women can spend as many as five hours every day retrieving water for the family's needs.

Lack of access to clean water contributes to the death of 14,000 Yemeni children each year (Whitehead 2015).

International Aid

As the conflict has continued, more and more humanitarian aid has been pulled from Yemen because of the danger for international workers. The Saudi-led coalition has frequently bombed clinics, schools, and hospitals that are not supposed to be military targets. Houthi rebels block aid to areas that need it or simply divert it to their own people. It is very difficult to get people or supplies into Yemen because of land and sea blockades. The Yemeni humanitarian crisis is one of the worst the world has seen; yet, aid cannot get to the people who desperately need it. Compounding the problem is that international news sources rarely report on the war in Yemen nor the resultant humanitarian crisis.

As a separate issue, it is very important to remember that people from the international community who want to help the women of Yemen need to understand and respect their traditions and beliefs. It is inappropriate to attempt to turn the people of Yemen to Western ways of viewing the world. For example, pursuit of equity for the women of Yemen need not focus on their religious clothing. A focus on education would take the women much further toward equality than invalidating their faith. Working with the people instead of colonizing their minds would go further toward aiding the people of this ailing nation.

Hope

With all the tumult that Yemen has been through currently and in the past, the women of Yemen continue to pursue change in their country. They show up to vote in increasing numbers. They pursue activism for women's rights. They organize and protest for what they believe is best for themselves and their families. All of this can be stymied by local traditions and beliefs, but they continue to persevere. As women are largely in charge of the wellness of their families, they seek to make the future brighter for those they love. They were active in the Arab Spring and continue to be active despite the current conflict. Yemeni women have hope for the future of their country, and we can see it in their actions.

Rwanda

Overview of Country

With a population of 12 million and only 10,188 square miles, Rwanda is a densely populated, landlocked country in east-central Africa (CIA 2017). It is surrounded by Uganda, Burundi, and the Democratic Republic of Congo and sits just south of the equator. Full of mountains, plateaus, and river valleys, Rwanda has been inhabited since 8000 BCE.

Rwanda is one of the ancient inhabitations in Africa. Present-day Rwanda was settled by hunter-gatherers in the earliest times, later followed by Bantu peoples. As the population swelled, a clan structure was established that evolved into kingdoms by the 15th century. The primary kingdom of Tutsis steadily adopted anti-Hutu policies that

would prove catastrophic in later centuries. Germany and Belgium colonized Rwanda and continued the pro-Tutsi policies that led to a Hutu revolt in 1959. The Hutus established an independent Hutu state in 1962, and in 1990, the Tutsis retaliated with the beginning of a civil war. The internal strife grew into what the world now recognizes as full genocide; Hutus killed approximately 500,000 to 1.3 million Tutsi and moderate Hutu. Recovery and healing have been hampered by the deep economic trouble the years of civil war and genocide have exasperated.

Rwanda is ranked among the poorest countries in the world and is 163rd out of 187 nations with a Human Development Index value of 0.483 (UNDP 2014). Rwanda has a low Gender Inequality Index (GII) value of 0.400, ranking it 80th out of 155 countries in the 2014 index. After the genocide of 1994, women started actively participating in nation-building activities and asserted their right to share power with men. The government has also put in place many institutions and mechanisms that enhance gender equality, with the hope that it will “lead to ‘meaningful participation’ of women in the long term” (Burnet 2008, 361).

The first local elections were held in 1999, and presidential and legislative elections followed in 2003. In 2009, Rwanda joined the Commonwealth and held a nonpermanent seat on the UN Security Council in 2013–2014. Women have been critical in the reconstruction after the war and genocide, and the Family and Women’s Affairs Ministry was established to encourage women in governmental positions from local to national levels. Rwanda continues to confirm the importance of women to recovery, reconstruction, and the prevention and resolution of conflicts, with peace building as a primary aim. The women’s caucus in parliament was crucial in the making of the constitution, and they were able to incorporate gender equity into not only the laws but the budget as well. National Women’s Councils were established and protected by law, and these councils are instrumental in establishing gender issues departments at all levels of government. Despite this noted gender equity priority, women continue to experience violence, including domestic violence, which many Rwandans accept as normal—just the way things are.

Tea, coffee, and banana farming form the base of the economy, with many citizens participating in unpaid subsistence agricultural work. Today, Christianity is practiced by 95 percent of the population, of whom 50 percent are Catholic, 40 percent Protestant, and 5 percent other Christian denominations (CIA 2017). Rwandans

speak Kinyarwanda, French, and English. In 2008, English replaced French as the language of instruction.

Girls and Teens

The female population is 52 percent. The Rwandan population is largely rural (83%) and young; approximately 43 percent are under the age of 15. The mean age is 22.7 years, and 52 percent are in the economically active age group of 15–65 years (CIA 2017). In the aftermath of the genocide, Rwanda was 70 percent women. Many men died or fled to neighboring countries, and many of the men who remained were imprisoned for war crimes.

In the days prior to genocide and national reconstruction, Rwandan children received a traditional education where boys received vocational training to be helping hands in their families and girls were mostly taught by their mothers at home to become housewives; domestic chores were considered more important than formal education for girls. However, the scenario has changed in post-genocide Rwanda. Education is attainable for many more girls. Women can inherit property, and child marriage is being restricted. Seventy-one percent of the Rwandan population is literate, with higher literacy levels among the males (73%) than females (68%). In primary and secondary levels, equal numbers of girls and boys are enrolled (UNESCO 2017).

Family and Kinship

Rwandans place high value on family and kinship as a means of continuing their culture and customs. Family ties are also a source of political, economic, and social empowerment in Africa. Africans do not promote individualism; rather, they are predominantly a family- and community-oriented society. The family unit is the center of activities as a social organization in Rwanda. Socialization for Rwandans, therefore, is based on the African practice of “it takes a village to raise a child.” In Rwanda, a patriarchal system is practiced, and inheritance passes from father to son.

In traditional Rwandan culture, as in other African countries, men are permitted to practice polygamy—to have more than one wife. Having more than one wife is considered a status symbol because women are considered economically beneficial. Rwandans give great respect to the practice of bridewealth because the parents receive a bride-price when girls get married.

Making Rape a War Crime

In 1994, Hutu extremists in Rwanda slaughtered 800,000 Tutsis. Although Tutsis only accounted for about 15 percent of the Rwandan population, they had dominated the country until the 1959 Hutu rebellion that overthrew the Tutsi monarchy. Many Tutsis fled to other countries, and a group of exiles formed the Rwandan Patriotic Front (RPF) that began fighting in Rwanda in 1990 until a peace accord was reached in 1993. In early 1994, the president of Rwanda, a Hutu, was killed when his plane was shot down. Hutu extremists blamed Tutsis and began a highly organized campaign to kill Tutsis. Eventually, the RPF prevailed and took the capital city of Kigali. Many Hutus fled to the Democratic Republic of Congo (BBC News 2014).

In 1994, the United Nations established the International Criminal Tribunal for Rwanda to prosecute people accused of genocide and other serious violations of international law. Although sexual violence against women and rape had long been associated with genocide, these offenses had never been declared war crimes. In Rwanda, perpetrators had systematically used rape as a weapon of war. Between 250,000 and 500,000 girls and women were raped during the 100 days of genocide. The two lawyers tasked with arguing the first Rwandan genocide case decided to argue that rape should be classified as a war crime and as part of the genocide (Jeltsen 2014). The defendant was Jean-Paul Akayesu—the mayor of Taba during the genocide—who had allowed and even incited atrocities against Tutsis in his community. He was found guilty of genocide and crimes against humanity, which for the first time included rape (United Nations 1998).

Education

Rwanda's education system is still uncompetitive despite significant increased government allocations to the education sector over the last two decades. The quality and the capacity of the education system have failed to keep pace with rising school enrollment rates. Only a minuscule percentage of the labor force has been educated up to secondary school or tertiary education levels. This contributes to a stark lack of skills in the labor force.

Prior to 1900, education was primarily delivered by the family and community. Children were also trained in war skills, ironsmith, poetry, and the like. In 1933, a Belgian census divided the Rwandan population by race and ethnicity. Tutsis were given opportunities the Hutus were not. This history also contributed to the genocide in 1994. Making education accessible to more Rwandan children and improving access to education in rural areas was the postindependence focus.

In 1966, a national curriculum was introduced with a scheme of conducting double shifts in the schools to maximize the limited capacity of available school

infrastructure. In 1977, Rwanda introduced Kinyarwanda as the language of instruction for primary classes up to eighth standard and then French for the remaining secondary education years. Postgenocide, the focus has been on investing in human capital and increasing the enrollment rates. In 1996, French and English became the languages of instruction in the upper secondary years. More money was allocated to education from 1996 to 2001, but it was disproportionately applied to secondary and tertiary education; therefore, primary education suffered. School costs are prohibitive for many students, and fee-free schooling has become prioritized. In 2008, English became the teaching language for all but the first three years of primary school.

The government of Rwanda continues to expand the capacity and quality of the education system, which will increase the education levels of the labor pool in the long term. In 2014, the human resources (3,432,441 learners and staff) in education sector represented 31.2 percent of the whole population, with 3,345,277 learners (30.4%) and 87,164 staff (0.8%). This demonstrates how the education sector plays a critical role in the development of every nation. There are more men in vocation training centers,

but more women are in adult literacy programs (Ministry of Education 2015).

Surprisingly, more girls than boys have never been to school in urban areas, but the reverse is true in rural areas. Nearly 28 percent of women have never been to school; it is 23 percent for men (UNICEF 2017). For youth 15 and older, the literacy rate is around 65.3 percent (UNESCO 2015).

Most of the jobs are in agriculture and are low paying. Rwanda aims to add more nonagricultural jobs to help usher it into the middle-income country status by 2020. Nearly half of Rwandan youth are out of work. Without skills to meet the needs of the current job market in Rwanda's rapidly growing cities, girls especially struggle to escape poverty. In the 2015–2016 budget speech, the government of Rwanda continued to demonstrate its resolve to enhance the education system and increase the skills in the local labor markets.

Health

The aftermath of the genocide had long-lasting health effects. As many as 250,000 women were raped in January–March of 1994, and many became HIV positive (United Nations 2014). Refugee camps were rife with disease, including a cholera outbreak. Three-quarters of children in 1994 were not vaccinated against measles and polio. Rwanda had the highest under-5 mortality rate and the lowest life expectancy in the world (WHO 2016).

When global assistance for the HIV crisis arrived, Rwanda was able to build its primary health care system alongside HIV treatment, and the right to health was written into the new constitution. Health is community-based, with the government supporting local community health care workers with training, equipment, and phones. “Today 97 percent of Rwandan infants are vaccinated against ten diseases, and rates of under-5 mortality, maternal mortality, and deaths due to tuberculosis and malaria, have fallen alongside the burden of HIV—although major challenges remain, including tackling the malnutrition of 44.7 percent of the children” (Binagwaho et al. 2014). Family planning, the availability of contraceptives, decreasing family size, girls' education, and social media exposure have all contributed to overall health. Even so, the birth rate is still high, and the number of people entering reproductive age creates challenges for this new government far beyond health care.

Access to Health Care

What health care systems were in place before the genocide were destroyed in the massacres and fighting. Rebuilding has taken significant time and resources. The training of health care workers is not fast enough to keep up with the needs of the population. HIV/AIDS and malaria remain ongoing crises. Only 7.5 percent of the gross domestic product (GDP) is allocated for health (WHO 2016). A combination of health insurance and out-of-pocket payments are how patients pay for their care. By 2012, Rwanda had one doctor for every 16,000 people and one nurse for every 13,000. There are now 45,000 trained community health workers for primary care in villages.

Maternal Health

The prioritizing of maternal and child health following the genocide has had a significant impact. Trained midwives increased from zero in 1996 to 1,000 in 2013 (Rwanda Ministry of Health 2014). Sixty-nine percent of birthing women are attended by a skilled birth attendant, and women face fines if they do not attend antenatal appointments or give birth outside of health facilities (WHO 2016). Between 2007 and 2011, the maternal mortality rate was 480 per 100,000 live births and has fallen each year since 2000; today, it is estimated between 249 and 584 per 100,000 live births (WHO 2016). Adolescent pregnancy is rising, however, and is currently 7.3 percent (NISR 2015). Skilled birth attendants and increased contraceptive use are positively affecting the maternal mortality rate. Over 10, Rwanda saw modern contraception use rates go from 4 percent to 45 percent (Worley 2015). The fertility rate has decreased, but it was still 4.0 in 2013, which is higher than the goal (Worley 2015).

To reach the 95 percent skilled birth attendance goal, Rwanda needs 586 more midwives. A gap between rural and urban access also needs to be closed; 40 percent of women live more than an hour from a facility (Rwanda Ministry of Health 2014). Even with the challenges still facing the country, Rwanda is one of few countries expected to meet the Millennium Development Goals for maternal and child health.

The period of the genocide had a direct impact on infant mortality and under-5 mortality rates; in 2012, the rates were 39 per 1,000 and 55 per 1,000, respectively (WHO 2016). Malnutrition rates are high, and many children are underweight or have stunted growth.

Diseases and Disorders

Though health markers are improving in Rwanda, people's lives are still affected by preventable diseases. Infectious diseases, HIV/AIDS and tuberculosis, and cardiovascular disease are the most common diseases in Rwanda. Though the numbers are down for tuberculosis and malaria, malaria still affected 208,858 people in 2010 (WHO 2016). Bacterial diarrhea, hepatitis A, and yellow fever are also prevalent. Posttraumatic stress disorder is commonly diagnosed and affects 29 percent of Rwandans (Rieder and Elbert 2013).

About 3 percent of the population is living with HIV, 130,000 children have been orphaned by HIV/AIDS, and an additional 56,000 have lost one or both parents to the genocide or other causes (UNICEF 2017). HIV prevalence has declined from 5.9 in 1990 to 2.9 in 2012 (WHO 2016). More than half of the 123,317 people living with HIV are taking antiretroviral therapy, which is bringing down the incidence rate overall (Mills 2014). There does seem to be a difference in prevalence rates in urban versus rural areas; rates are declining in urban areas, but stable or rising in rural areas. Rwanda's government is monitoring to assess more accurate data about prevalence and new infection rates in the near future.

Employment

Rwanda now has one of the fastest-growing economies, but the high birth rate and large numbers of dependent children disproportionately affect women's ability to engage in the paid workforce. More women work for wages in urban areas than in rural areas. Following the genocide, women were active behind the scenes to advocate for women's rights to inheritance and property. In 1999, "the inheritance law" was ratified. The constitution includes explicit equality language, including quotas in government representation. Many Rwandans, however, still live below the poverty line, and the country itself remains a low-income country.

Family Life

The Rwandan Family Code was adopted in 1988. The adoption of the family law aimed at ending the dual legal framework that governed the family unit in Rwanda. Originally, the rules governing the family in Rwanda were drawn from the Belgian system, so the endeavor was to adopt a

unified system. Article 98 of the Constitution holds that "customary law remains in force only to the extent that it has not been superseded by legislation and that it contains nothing that is contrary to the constitution, to legislation, to regulations, to public order or to public decency."

Tradition and Civil Code

In Rwandan tradition and culture, the family is linked by blood relationships. People in the family at one point have shared a common ancestor. The family is recognized from the male side. Relatives of the wives of the male members of the family are excluded from the family. Males are free to marry several women, and this negates the possibility of divorce. A marriage is traditionally seen as an alliance of two families, which are seen to represent two lineages, and therefore cannot be dissolved. In case of any misunderstandings, the family elders first try to reconcile the partners before the husband decides to marry another woman. Any separation has to be agreed upon by the families to ensure that family relations are not harmed in any negative sense.

However, the Civil Code in Rwanda clearly outlines the grounds for divorce: if one of the spouses is at fault, one spouse is absent for 12 months, there has been a separation lasting up to three years, or there is mutual consent between the spouses. The code demands that divorcing spouses must hand over half of their assets to their children. Children customarily stay with the father's family. In a divorce, the mother only retains very young children.

LGBT Rights

According to Article 26 of Rwanda's Constitution, "Only civil monogamous marriage between a man and a woman is recognized. No person may be married without his or her free consent. Parties to a marriage have equal rights and duties upon and during the subsistence of a marriage and at the time of divorce. The law determines conditions, forms, and effect of marriage." Homosexuality is not illegal, although it is treated as if it is. LGBT individuals can be arrested under public morals penal codes. After an attempt to codify this discrimination in the constitution, activists intervened, and it was dropped. Criminalizing homosexuality is in direct violation of the Rwandan Constitution's Articles 16 and 22(1), which reads, "All human beings are equal before the law. They shall enjoy, without

any discrimination, equal protection of the law.” Rwanda was one of only five African countries to sign the UN Joint Statement titled “Ending Acts of Violence and Related Human Rights Violations Based on Sexual Orientation and Gender Identity” in 2011.

Politics

Rwanda is a leader in women’s participation in politics and government and has won the African Gender Award and the international Women in Parliament Award. Rwanda and Bolivia are the only two nations that have more women than men serving in governmental office. Rwanda’s Chamber of Deputies is 64 percent women; the global average is only 23 percent (United Nations 2013). Of the 14 Supreme Court judges, 7 are women, and women serve in positions at every level of government. Women occupy 26 percent of provincial executive council posts (Izabiliza 2003). The Ministry of Gender and Family Promotion ensures representation of women’s interests at the national level. The constitution states that women need to occupy 30 percent of government bodies, but precise mechanisms are not outlined. Women were critical in the development of the constitution and the postgenocide restructuring and healing.

Increasing the number of female parliamentarians has two very important benefits. The symbolic impact of seeing women in the parliament on the remainder of the population is very great. It creates a sense of pride and belonging and a psychological support system where women feel secure that sufficient numbers of women in the corridors of power will protect their interests. These women also become role models for larger aspirations and expectations for the rest of their class.

The second significant impact is the presence of women’s issues actions and the emergence of a broader gendered perspective in the legislature. Rwandan women have demonstrated their ability and willingness to exercise power in the legislature to make their substantive representation effective. This has also been possible because of many women having played prominent roles in Rwandan Patriotic Front (RPF) and thus attained and imbibed the necessary leadership traits and requisite discipline. Studies suggest that all this has led to the slow but steady erosion of the patriarchal culture of the legislature in Rwandan polity. Additionally, it has improved women’s working relationships with their male counterparts.

Another smart move that Rwanda has made to empower women is to move toward removing quotas and

allowing them to contest directly. This has empowered them in a real sense compared to women in neighboring Uganda and Tanzania, where women legislators in office as a result of quotas are seen as “second-class parliamentarians.”

The women’s movement has been influential in the establishment of this new constitution and government, but, ironically, they are now less active because many of the leaders of the women’s movement are now serving in the legislature. Nevertheless, women’s rights work continues to be done for women and by women. Women were crucial in drafting and passing a bill on combating gender-based violence in 2008.

Religious and Cultural Roles

Rwandans practice traditional religion, or animism (view that spirits inhabit natural places, beings, and things in the everyday world), as well as faiths that outsiders have brought in. *Imana* is Rwandan animism’s Supreme Being, and *abazimu* are the spirits of ancestors.

Rwanda has several existing religions. This is the effect of a constitutional provision for the freedom of religions and religious practices. The Roman Catholics who came to Rwanda through their missionaries in 1880 developed the so-called Hamatic theory of race origins, which taught that the ethnic group of Tutsis was a superior race compared to the Hutus, a teaching that led to a racial division between the two ethnic groups.

This racial division culminated in a collision between the two groups in the 1994 genocide that also involved the Roman Catholic and other minor religions. Three Roman Catholic priests and two nuns were convicted of active participation in one of the most shocking massacres in human history. Because of that participation, attendance in Roman Catholic ceremonies dwindled, while the Muslim population increased due to the protection it extended to both Tutsis and Hutus wanting to not be identified with the genocide’s perpetrators. In the commemoration of the horrific event in 2007, the government invited only a Lutheran representative to offer a prayer because of strained relations with the Catholic Church over the role of church officials in the genocide. An Interfaith Commission for Rwanda has been activated with the hope of reconciling the people, especially the genocide survivors and prisoners and the families of the genocide detainees.

S

Senegal

Overview of Country

Senegal is a lower middle income, developing country located on the westernmost part of Africa. It is bordered by the Atlantic Ocean, Mali, Gambia, Guinea, Guinea-Bissau, and Mauritania. Its population is approximately 14 million (World Bank 2015), and its capital, Dakar, is located in the northwest region of the country.

Senegal became fully independent (from France) on June 20, 1960, merging with French Sudan to become the Mali Federation. However, due to a range of domestic political challenges and difficulties, the federation dissolved on August 20, 1960, with Senegal and French Sudan (which was renamed the Republic of Mali) each proclaiming their independence. Senegal's first president was Leopold Sedar Senghor, who served from 1960 until being succeeded by Abdou Diouf in 1980. The country's current president, Macky Sall, was elected in 2012.

Since gaining independence, Senegal has come to be regarded as one of Africa's model democracies. It has an established secular, multiparty system and a tradition of relative stability and civilian rule. Senegal's economy is mostly based on commodities, construction, and natural resources. However, as with many other countries across sub-Saharan Africa, agriculture constitutes a key sector of its economy. Tourism is also a significant source of foreign

exchange, and with many Senegalese migrating abroad, the money they send home (remittances) represents another important source of revenue.

The population of Senegal is quite diverse, and there are numerous ethnic groups within the country, including the Wolof, the Fula, the Serer, the Jola, the Mandinka, the Soninke, and many other smaller groups and subgroups. There are also a small number of Europeans and Lebanese within the country.

Islam is the predominant religion within Senegal, being practiced by approximately 92 percent of the country's population, with the vast majority of followers being adherents of the Sunni branch. Christianity (predominantly Roman Catholic and several Protestant denominations) is practiced by approximately 2 percent of the population, and about 6 percent of the population have animist, traditional, or other beliefs (Leichtman 2009, 115).

More than 30 languages are spoken in Senegal. While French is considered the official language, it is mostly spoken by the educated elite; a larger percentage of the population actually speak Wolof. Several other widely spoken languages in Senegal are Pulaar, Diola, Sereer, Mandinka, Malinke, and Soninke.

Girls and Teens

More than half of Senegal's population is female, and a large percentage of the country's population consists of

youth (PRB 2013, 6). The social status and role of females within society is largely shaped by traditional patriarchal, conservative local customs and the predominant religion, Islam. Women in Senegal typically do most of the household chores, such as cooking, cleaning, child-rearing, fetching water, and tending the fields. Girls generally learn to be women by observing and emulating their mothers, older sisters, or other elder women. From a young age, girls participate in a range of household and agricultural tasks, while some are also engaged in various types of employment outside the home.

Education

The country's education system is based on the French system (owing to Senegal's long history as a former colony of France), featuring primary, secondary, and advanced levels. The Senegalese Constitution (revised and adopted in January 2001) guarantees access to formal education for all children; yet, the law is not fully enforced, and implementation has faced various challenges. Islamic Koranic schools can be found across Senegal, and many young girls (as well as boys) are enrolled in these schools instead.

Although gender parity has been achieved within formal primary education (for every 100 boys enrolled, there are approximately 104 girls), girls' enrollment rates decrease sharply at higher levels of education. For girls, leaving formal education is very common, both in the shift from primary to secondary levels as well as within secondary education. The prominent factors leading to girls dropping out include scarce resources, limited school facilities, sexual abuse in schools, and early marriages or pregnancies. Girls are also often forced to work to financially support their families. In 2009, girls' enrollment in secondary education was 27 percent, and for every 100 boys enrolled in secondary education, there were approximately only 79 girls. Throughout Senegal, women's illiteracy remains a persistent problem, with only 39 percent of women aged 15 years and over being literate, in contrast to 62 percent of men (OHCHR 2015; UNESCO 2012; Vaughn n.d.).

Employment

Women in Senegal generally work in agriculture or informal employment outside the home. Female employment is important because it is a strong instrument for empowering women, and it reduces fertility rates. Employed

women have a significantly higher age at marriage and at first childbirth, and they also have fewer children.

While there are no formal barriers to women's participation within the economy, Senegalese women still face many different challenges. Regarding workplace rights, there are no national laws mandating nondiscrimination in hiring based on gender, nor are there laws that penalize or prevent the dismissal of pregnant women. In comparison to men, Senegalese women have higher unemployment rates, and they generally earn less pay within similar positions. Although women tend to do the large majority of agricultural work, they have very limited access to land, and they struggle to access capital or obtain loans.

A major handicap for Senegalese women is their generally low level of education and skills training. As they are less likely to have formal education, training, or skills, and because they remain responsible for a range of familial and domestic duties, Senegalese women are at a considerable disadvantage when competing for wage jobs. Within the informal sector, many women (as well as girls and teens) sell food items in marketplaces (e.g., fish, peanuts, fruit, honey, gum, etc.) or become street vendors (selling arts, crafts, jewelry, or other items), while some women also work as domestic housekeepers or cleaners. Prominent challenges for Senegalese women working within the informal sector include low pay, the risk of employer abuse, long hours in substandard or dangerous conditions, a lack of access to basic social services or benefits (e.g., overtime pay or maternity leave), and limited prospects for economic advancement.

Importantly, in many villages and towns across Senegal, women often establish cooperative groups that pool savings, resources, or credit. These grassroots groups also help women and villages or communities organize efficient production and distribution networks, thus improving women's and communities' economic and living standards.

Health

Although women's health has improved tremendously in the decades since Senegal's independence, much remains to be done so that they can fully realize their right to health. Inequality remains a prominent problem, and there is a high disparity in the quality and extent of health services available between urban and rural areas. A large percentage of Senegalese women continue to live below the poverty line, and this has direct negative implications

on their health and well-being. Women in Senegal remain at considerable risk of preventable diseases and sexual infections and diseases. Senegalese women often continue to endure poor hygienic conditions and constraints in access to clean water, and they are afflicted with HIV/AIDS as well as many other noncommunicable diseases at a much higher rate than men (OHCHR 2015; USAID 2014; WHO 2014). More people die from malaria than any other cause in Senegal (PATH 2013).

Maternal Health

Additionally, Senegalese women often lack access to information about or control over their sexual and reproductive rights and health, thus resulting in pregnancies at an early age, sexual infections or diseases, or closely spaced births that can be quite detrimental to women's health. For example, nearly one in three Senegalese women report that they would like to avoid or delay pregnancy, but they cannot access modern contraceptive methods and do not currently use any method of family planning. Conservative community and religious leaders often frown upon the use of contraceptives, and many women remain dependent on their husband's approval to use modern family planning methods.

Furthermore, women in Senegal are faced with highly restrictive abortion laws, with abortion being legally permitted only when a pregnant woman's life is in danger. As a result, many pregnant women will turn to clandestine, dangerous abortions that can lead to death or serious injury. Senegal's abortion laws have been widely criticized by an array of human and women's rights groups, and there have been calls to expand the availability of abortion for women, especially in cases of rape and incest (OHCHR 2015; PANA 2015; PATH 2013; USAID 2014; WHO 2014).

While maternal mortality has improved, Senegalese women still face considerably high maternal mortality rates due to a lack of spacing births and unsafe abortions (PATH 2013). Approximately 68 percent of babies are born in a public hospital and 26 percent at home (WHO). Mothers have 4.9 children. The perinatal mortality rate has dropped significantly, but safety and good outcomes for mothers and babies vary substantially by region (WHO). Two examples of this are the cesarean birth rate and access to postnatal care, both of which are higher for wealthier women (WHO). In 2014, there were far more nurses, midwives, and auxiliary nurse-midwives (6,992) than physicians, generalists, or obstetricians and gynecologists (1,171; WHO).

Female circumcision, also referred to as female genital cutting (FGC), female genital mutilation (FGM), or excision, is practiced in Senegal and has a long history within the country. Currently, estimates suggest that between 25 percent and 30 percent of Senegalese women undergo the practice. FGC, usually organized by the women in the family or extended community and performed by traditional practitioners, is seen as bringing social status and is a prerequisite for marriage. Girls that have not undergone the practice are often ostracized, shunned, and suffer from discrimination. There are some variations in prevalence rates, with the practice being slightly more common in rural areas, among Muslims, and within the Soninke and Pular ethnic groups (UNICEF 2013).

FGC, which is increasingly regarded as a global child, women's, and human rights issue, poses numerous health problems for girls and women, including significant pain, trauma, shock, depression, hemorrhaging, incontinence or difficulties passing urine, chronic infections, ulceration of the genital region, cysts and abscesses, disability, infertility, scar formation, sexual dysfunction, painful sexual intercourse, and possible HIV transmission, and it also increases the risk of labor complications and newborn or maternal deaths. Senegal enacted legislation criminalizing FGC in 1999, and many women's and rights groups advocate across the country to eliminate the practice. As a result, a growing number of communities and villages have declared that they will no longer practice FGC.

Notably, Tostan (which means "breakthrough" in Wolof)—a nongovernmental organization (NGO) in Senegal that has worked to combat FGC—received the 2007 Conrad N. Hilton Humanitarian Prize for its efforts to bring about social change by empowering communities to transform lives and alleviate human suffering. Tostan utilizes a holistic, multidimensional approach to development and positive social transformation based on respect for human rights. It is also active within communities in Guinea, Guinea-Bissau, Gambia, Mali, Mauritania, and parts of East Africa.

Family Life

Polygyny, a narrow form of plural marriage in which a man has more than one wife, is legal and quite common in Senegal, particularly in rural and urban areas. It has a long historical influence in the country as a result of both Islam and local traditional customs. Within Senegalese society,

polygyny represents a potential economic benefit. A family with more women typically receives greater contributions to the household, and an increased number of children are viewed as potential contributors (e.g., children are able to work on the family farm). Senegalese law allows couples to choose polygyny at the time of marriage, and many women often accept or support the practice due to the lower social status that is given to unmarried women. Additionally, the practices of levirate, in which a man is obligated to take as his wife the widow of a deceased brother, and sororate, where a woman is obligated to marry the spouse of her deceased sister, are also common in Senegal. Generally, Senegalese women with higher levels of education are less likely to be in polygynous marriages than women with lower levels of education.

Societal norms in Senegal place strong expectations on women to get married, establish a household, and have children. For a woman, bearing children secures her place as a member of her husband's family and acceptance from her in-laws. For some young women, marriage is viewed as a way to change their challenging circumstances or improve their dire financial conditions. In rural areas, they may seek marriages that will take them to urban areas. According to Senegal's Family Code, the legal age for girls to marry is 16 years old; yet, many girls (particularly in rural areas) are married before the legal age. Overall, nearly one out of three girls marries as a child in Senegal (i.e., before 18 years of age). Several factors that considerably influence the age at which Senegalese women marry include level of education, wealth, and region. Specifically, Senegalese women with more education, from higher income households, and those living within urban areas tend to marry later, and Senegalese girls from the poorest households (which are generally located within rural areas) are most likely to be married as children (UNFPA 2012; Woodfork 2004, 214).

Female virginity is generally highly prized in Senegalese society. Sexually active girls are frequently ostracised and viewed negatively, and not being a virgin can restrict a girl's marriageability (e.g., nonvirgins cannot legally have a Muslim wedding). In this regard, the practice of FGC is often seen as necessary for gaining social acceptance; preserving purity, femininity, and cleanliness; and offering girls or women better marriage prospects (UNICEF 2013; van Eerdewijk 2009; Woodfork 2004, 215).

Homosexuality is punishable by imprisonment and a fine; same-sex marriage is not legal. Discrimination based on sexual orientation is not prohibited, and violence

against LGBT individuals is common. It is, however, legal to change legal gender.

Politics and Religious or Cultural Roles

Senegalese women have held an influential role in the country's society and politics. Historically, across several different regions and ethnic groups within Senegal, older women have been regarded as special guardians of tradition, and they often serve as priestesses or other spiritual figures. Senegalese women also fulfill important roles as mediators within social conflicts, and their highly regarded sociopolitical status is evidenced through matrilineal succession or inheritance (i.e., passed down through the mother's line) in some ethnic groups, such as the Serer.

One of Senegal's most highly respected historical figures is Aline Sitoé Diatta (1920–1944), who was a royal priestess, labor organizer, spiritual leader, and preacher. Diatta was also a key figure during Senegal's anticolonial era, and she sparked a civil resistance movement against French colonialism across the whole of the Casamance region (located in the southwest of Senegal). She was eventually imprisoned in 1943 and deported to Timbuktu (located in neighboring Mali), where she died shortly afterward. Diatta is now cherished as a symbol of resistance and cultural pride, both in Senegal and throughout West Africa. Across Senegal, schools, public buildings, a passenger ferry, and a large multisport athletic stadium proudly bear her name.

Women in Senegal enjoy full political rights to vote and stand for election. Nationally, they form a large percentage of the electorate, and they have long organized at the local level, establishing cooperatives and various associations to improve the availability of and access to public services or opportunities. Despite this, however, they have not gained tangible power at the parliamentary level. Senegalese women have not formed a separate women's party, and they have not often held important decision-making positions within the patronage structure of Senegalese parties.

One prominent grassroots women's sociopolitical organization is the Fédération des Associations des Femmes du Sénégal (FAFS). FAFS works to promote the interests of women and girls in education, health, and the economy and also to improve women's opportunities and representation within the political sector. In recent years, considerable progress has been made in terms of women's participation in political life. For example, partly as a result of the country's 2010 Law on Parity, Senegal has significantly increased the

number of women in its national parliament, and it now boasts one of the greatest proportions of women in national parliament in the world (OHCHR 2015).

Notably, shortly after his victory in the 2000 presidential elections, Abdoulaye Wade appointed Mame Madior Boye, a well-respected lawyer and politician, as prime minister of Senegal, making her the first woman in the country's history to hold the prestigious post. She served from March 2001 until November 2002. After her brief stint as prime minister, Boye has remained politically active, and she has worked for a variety of prominent international organizations. In September 2004, the African Union Commission appointed Boye as the special representative for the protection of civilians in armed conflicts. She also often acts as a mediator in different African conflicts.

Within Senegalese society, sports are quite popular, particularly football (soccer), basketball, traditional wrestling, and athletics. Many women and girls are involved in a number of sports at school, within clubs, and through community programs. However, Senegalese girls and women often face significant challenges to their full or equal participation in sports. There is often a lack of funding and resources for training or equipment, and many families and communities frown upon women's involvement in sports. Generally, conservative and patriarchal societal and cultural attitudes in Senegal promote the concept that women and girls should not participate in sports, often claiming that sports can jeopardize a woman's femininity and fertility or conflict with a woman's traditional roles and responsibilities within the home.

Although many women's sports are faced with significant obstacles in Senegal, in recent years, women's basketball has grown considerably. Senegal has developed a national women's basketball league, and different Senegalese women's teams have achieved notable successes within various regional competitions.

One of the most successful athletes in Senegalese history is the short-distance runner Amy Mbacké Thiam. As a child, Thiam was fond of running and also passionate about football (soccer). Her athletic talent was recognized early on by a Senegalese coach, and she began to compete and succeed in various local running competitions. Thiam's talents would eventually see her move on to more challenging competitions, and during her career, she has competed in numerous prestigious competitions, including the Olympics, the All-Africa Games, the African Championships, and the Golden League. In 2001, Thiam won the 400-meter gold medal at the International Association of

Athletic Federations (IAAF) World Championships, held in Edmonton, Canada. Thiam's gold medal was the first world championship in any sport, male or female, in Senegal's history. After her impressive victory, Thiam became a national heroine and celebrity in Senegal. She endorsed a variety of commercial products, was regularly featured on radio and television, and, in 2014, she was appointed as a special adviser to the president of Senegal.

Issues

Senegalese women are affected by human trafficking, with the country regarded as a source, transit, and destination country for children and women. Trafficking within Senegal often involves women and children being subjected to forced labor or sex trafficking. For example, young Senegalese girls (and also boys) are subjected to domestic servitude, forced labor in gold mines, and exploitation within the lucrative sex trade. Generally, internal trafficking is more prevalent than transnational trafficking. Senegalese women and girls are trafficked to neighboring countries, Europe, or the Middle East, mainly for domestic servitude, while women and girls trafficked for sexual exploitation through prostitution or sex tourism typically remain within Senegal. According to the annual *Trafficking in Person's Report*, the government of Senegal does not fully comply with the minimum standards for the elimination of human trafficking, although it is making significant efforts to do so (U.S. Department of State 2014).

Senegal has ratified the main international and regional women's rights documents (such as the Convention for the Elimination of Discrimination and Violence against Women), but violence against women remains a widespread, pervasive problem. A large majority of Senegalese women have been victims of violence, with violence tending to be domestic based or within the family. Many cases of violence against women in Senegal are related to rape (spousal rape is not legally recognized in the country), aggression, incest, pedophilia, and sexual harassment or exploitation.

While violence against women is against the law in Senegal, with the Penal Code of 1999 integrating measures that punish those who commit violence against women, Senegalese women face obstacles in accessing justice. Laws against violence are rarely enforced in Senegal; the country has an ineffective legal system, with authorities rarely intervening and few cases of violence against women actually reaching trial or conviction. As well, many Senegalese

women are unaware or not fully aware of their rights, while patriarchal attitudes, conservative values, and long held social norms in the country tend to condone or accept violence against women by members of the family, such as husbands or fathers (OHCHR 2015; PANA 2015).

Sierra Leone

Overview of Country

Sierra Leone is a small country in West Africa that borders the North Atlantic Ocean between Guinea and Liberia. The population of 5.6 million inhabitants is composed of two major tribal ethnic groups, Temne (35%) and Mende (31%); multiple smaller tribal groups (Limba, Kono, Krio, Mandingo, and Loko); and small numbers of Europeans, Lebanese, Pakistanis, and Indians (CIA 2014). English is the official language of Sierra Leone, but its regular use is limited to the literate minority. Mende, Temne, and other tribal languages are spoken in the rural regions, while Krio (the language of freed Jamaican slaves) is understood by 10 percent of the overall population and is the primary language in the capital city of Freetown.

Twenty-nine percent of the population is urban dwellers, with the majority living in Freetown. The age structure of Sierra Leone shows a young population, with 42 percent under the age of 15. The male-to-female population ratio is nearly equal with the under 24 age group, but the older age categories have almost 12 percent more females than males (CIA 2014). This can be attributed

to the 11-year war that ravaged the country from 1991 to 2002 and killed many male heads of household and young men.

The majority of Sierra Leoneans are Muslim (60%), particularly in the rural regions (CIA 2014). Thirty percent of the population continues to practice indigenous belief systems, and 10 percent have been converted to Christianity. Rural populations commonly practice a blend of Muslim and indigenous beliefs that overlap with a culture rich in traditions of kinship and community passed from one generation to the next through song, dance, and storytelling.

Sierra Leone is one of the world's poorest countries with tremendous inequality in income distribution; 53 percent of the population lives below the international poverty line of USD\$1.25 per day of income (CIA 2014). Sierra Leoneans are largely rural dwellers (71%) living in traditional villages, where they rely on subsistence farming with few opportunities for economic stability. The mineral wealth of the country is exported; the local miners and communities see little of the benefit. Multinational corporations perpetuate the poverty of the local farmers by controlling agricultural exports.

Sierra Leone has a long history of slavery, colonization, and conflict. Export slavery began in the late 15th century and continued until the mid-19th century. The British incorporated the country as a colony in 1792, and Sierra Leone became a home for freed American slaves. Following its independence as a British protectorate in 1961, Sierra Leone formed a constitutional democracy. The most recent 11-year war (1991–2002) caused mass destruction and disruption to the lives of the people. Rural areas were most affected because of the lack of trained soldiers who could have possibly stopped the rebel forces.

The legal system is a mixture of English common law and customary law. Sierra Leone has a unicameral Parliament of 124 seats, with 112 of those members elected by popular vote and 12 filled with paramount chiefs chosen through a separate election process. In 2014, only 12.5 percent of the total number of parliamentary seats was held by women (CIA 2014). Women over age 18 have voting rights, but due to patriarchal customs, low female literacy rates, and limited opportunities to participate in the political process, few women exercise their right to vote.

Girls and Teens

Young children usually live with their mothers, where they are raised with the help of co-wives and extended family.

Grandmothers are instrumental in the rearing of children, and it is not uncommon for a grandmother to be raising several grandchildren, particularly if a mother has died. When a child, male or female, reaches the age of seven to nine years, his or her father or a male relative has the authority to make all decisions relative to education, fostering, and entrance into secret societies. For girls, this also includes marriage choices. An agreement may be negotiated with her future husband and his family while she is still a young girl. However, the frequency of these practices is declining countrywide and is even less common in urban areas.

Girls are reared under a dependency-training model whereby they are taught to comply with behavioral expectations that include performance of assigned tasks and reliance on the domestic group rather than on oneself. Independence is not a strong cultural value promoted within the society. The training received during years of instruction with gendered secret societies also plays an important role in teaching girls to be good wives and mothers. The training period is followed by initiation rituals that usually include female genital cutting, a prerequisite to marriage for girls in particular. These traditional customs are prevalent in rural regions but are practiced with less frequency in urban areas. However, according to UNICEF, in 2011, 88 percent of adult women had completed initiation, but only 10 percent of their daughters were fully initiated. Despite this apparent trend to no longer complete initiation, the practice continues to be supported by 72 percent of the population (UNICEF 2013).

Education

The school system in Sierra Leone is based on a British educational model, and English is the language of the educated. Most children in the villages attend school, but their attendance is sporadic because of the cost of uniforms and school supplies and the need for their help at home. Primary education in the rural regions is conducted in substandard school structures with mostly untrained and uncertified teachers. One school will serve numerous surrounding villages, adding another barrier to consistent attendance for students who must travel long distances on the bush roads. The rates of secondary school attendance drop dramatically throughout the country for both genders, but for girls, school attendance drops from 76 percent (primary) to 33 percent (secondary) versus 73 percent (primary) to 40 percent (secondary) for males (UNICEF 2013).

Girls begin to assist their mothers at an early age with cooking, caring for younger siblings, laundry, and farming or working in the family business. These conditions, combined with patriarchal family structures, have led to lower literacy rates for females (32.6%) than males (54.7%) (CIA 2014). For many girls, pursuing a secondary school education is not possible because of the poverty of their families, early marriage, and urban locations of the secondary schools. Because the cost of secondary education is beyond the capacity of many parents, some children are fostered to relatives who live in the larger towns and cities. This custom of fostering children to other relatives is also based on the belief that children should come to know their other relatives and that fostering strengthens kinship bonds within the extended family.

Health

The African continent as a whole includes some of the poorest countries and worst health statistics in the world. But the citizens of Sierra Leone suffer more than even most other African countries. Women specifically endure gendered inequity and inequality that reduces their access to limited resources, education, health care benefits, and economic opportunities. Access to the limited resources of the country is reduced by their marginalized position within the patriarchal society.

Access to Health Care

The infrastructure of Sierra Leone was destroyed during the war, including road networks, health care facilities, and trained medical personnel. The current strategy for improved health care for Sierra Leoneans is focused on building facilities and training medical professionals; however, this will take years to complete and will leave most villagers without adequate health care options for some time to come. In the meantime, the Ministry of Health and Sanitation has created programs to train community health workers (CHWs) who serve as health educators and promoters, vaccinators, and malaria treatment providers. CHWs are a valuable local resource, but they are not paid, which places an additional burden on local communities to compensate them in some way for their service to the community.

Maternal Health

The biggest risk to women's health in Sierra Leone is pregnancy; 1 in 23 women will die as the result of a pregnancy- or

Women's Voices

Delivery on the Bush Road

From Sudy Storm's Field Notes, 2007

Fati labored through the night with no progress. With the first light of dawn, the midwife knew it was time to send her on the long walk down the bush road to the hospital with the hope that she and the baby would survive. As two of the strongest men in the village prepared to carry her by hammock, the midwife did a final check, hoping for a miracle. There was no progress, only the steady rhythm of a fetal heart and agonized moans of a laboring mother. Two days later, the midwife received word that Fati had survived the journey, but her baby had not. Somewhere along the bush road, the tender heart had gone silent.

—Sudy Storm

childbirth-related complication, placing Sierra Leone in the fourth position worldwide for its maternity mortality rate (MMR) ranking in 2010 (adjusted MMR, 890/100,000 live births) (CIA 2014). The infant mortality rate (IMR), 11th worldwide, and death rate for children under the age of five (185/100,000) have also continued to position Sierra Leone as one of the highest-risk countries in the world for the health of its women and children.

In an attempt to improve the health of its most vulnerable populations, the government passed a Free Healthcare Initiative (FHI) in 2010. This initiative provides free prenatal, labor and delivery, and postpartum care to women as well as free health checks and immunizations for all children under five years of age. Though this is a noble effort, the infrastructure needed to support such a program is still inadequate. Many village health posts are not staffed with well-trained personnel, particularly maternity care providers, or the drugs and vaccines necessary to meet the needs of the populations these health posts serve. The FHI also mandates that all deliveries take place in facilities, and traditional midwives are no longer trained or allowed to conduct deliveries in their villages. This has created distrust between the villagers, health post staff, and the Ministry of Health and Sanitation. It has also left remote villages, at times unreachable due to impassable

road conditions, without trained traditional midwives to handle village deliveries. This puts women at even greater risk for poor maternity outcomes.

Countrywide, 47.9 percent of young women are married, and 38 percent have had a child by the age of 18 (CIA 2014). Early marriage and birth prior to age 18 increase the risks for poor maternity outcomes, obstetric fistula, and premature death. In 2012, only 11 percent of the country's women had access to contraceptive options (UNICEF 2013). This is partially a result of cultural customs that consider children a blessing and a testament to the prowess of a man. Also adding risk to the health of women in Sierra Leone are the patriarchal customs of male authority whereby a woman must first gain permission from male family members prior to seeking contraception or medical treatment for herself and her children. In the event of an emergency in the remote villages, this can mean delays in getting women to care facilities in time to save their lives.

Women are also victims of economic inequalities and limited access to health care resources within Sierra Leone. For example, attendance at births by a skilled attendant for the poorest 20 percent of women is only 44 percent, but for the wealthiest 20 percent it is 85 percent (UNICEF 2013). This is in part due to the remoteness of some villages and a lack of road networks that prevent women from getting to a care facility, but more importantly, health care resources are clustered in Freetown and the larger cities where the wealthy reside.

Diseases and Disorders

Women in Sierra Leone have endured a long history of gender inequality and, more recently, prolonged conflict in their country. Current economic, political, and environmental conditions have placed them into the highest world rankings for infant and maternal mortality rates. A 2011 estimate indicates that only 57.5 percent of the population has a source of safe drinking water, and only 12.9 percent have access to sanitation facilities (CIA 2014). The lack of safe water and frequent exposure to standing water during farming activities place women at increased risk for vector and waterborne diseases. Some of these diseases, such as malaria, pose even higher risks to women and their infants during pregnancy. The life span of Sierra Leonean women is 10 years less than the life span of other African women, half that of women in developed nations, and the lowest in the world (Berhane-Selassie 2009). Because 70 percent of the population lives in rural regions where

poverty and limited access to resources are the norm, the life span of women in Sierra Leone will continue to be one of the world's worst until these determinants of health are improved.

Ebola

After the outbreak of Ebola in early 2014, Sierra Leone quickly became the country with the highest rate of transmission of the deadly disease. Years of conflict had decimated the health care infrastructure and created the country's desperate need for health workers. The World Health Organization (WHO) is focusing attention on the country and neighboring Guinea and Liberia to provide support for the ongoing control and eradication of Ebola. The disease has a particular devastating effect for birthing women who are at increased risk for transmitting and contracting the disease when seeking health care.

Employment

Limitations in the local economic system do not allow most households to create economic stability. Although villagers practice a kinship mode of production, subsistence farming, research has shown that most male heads of household do own coffee, cocoa, and palm fruit plantations that, prior to the war, were profitable. Since the end of the war, these plantations have sat overgrown in the bush because the landowners must devote their energy to subsistence farming and are therefore unable to hire laborers to repair and maintain the plantations. Landownership continues to follow patrilineal descent patterns despite the passage of the Registration of Customary Marriages and Divorce Act in 2007, which empowers men and women to both acquire property. Despite this act, few women actually own land, leaving them few options to achieve economic stability. Demographic data from southeastern Sierra Leone show that women attempt to subsidize their household income by selling cigarettes, condiments, soap, and surplus produce from the farms they are allowed to work. But these small markets do not provide adequate income to move the women out of poverty.

For the small percentage of village women who are educated, there are jobs available as office staff for the multinational corporations that export the natural mineral and agricultural resources from the rural regions. For those women with little or no education, there may be work in the mines or on the corporate plantations, but these jobs

are often seasonal and do not always pay livable wages. In the cities, educated women may find work as secretaries, office staff, or laborers for governmental and nongovernmental agencies or for the foreign businessmen who own much of the commerce in the country. Other women attempt to support their families with small businesses in the local marketplaces.

Family Life

In Sierra Leone, 44 percent of all girls are married at an early age despite the Registration of Customary Marriages and Divorce Act that prohibits marriage before age 18 (UNICEF 2013). Enforcement of this act, particularly in the rural regions of the country, has been minimal and without legal consequences for men who marry these young women. The cultural customs, poverty of the villagers, and limited opportunities for education and jobs for girls make early marriage one of the only solutions to some of these problems. Families negotiate a bride-price for their daughters that provides much-needed income to the family. Because cultural customs of residency are patrilocal, the new husband and his family gain another laborer for their households and farms.

Polygamy is common in Sierra Leone and follows ancient traditions of combined Muslim and indigenous belief systems. A man can have up to four wives, according to Muslim custom, and as many as he can provide for, according to customary law. Polygamy is more common in rural regions versus the urban areas, where the cost of living makes it difficult to support a large family. In polygamous households, women are expected to earn their own income and provide for their children. Divorce is uncommon in Sierra Leone due to traditions of community support and mediation and the potential refund of the bride-price to the husband's family. However, the passage of the Registration of Customary Marriage and Divorce Act makes dowries nonrefundable, making it easier for wives to leave an unhappy or abusive marriage without fear that her bride-price must be repaid to the husband's family.

Politics

Positions of chiefdom and village leadership (males and females) are inherited through male lineage and then elected by the residents. Community leaders are also elected by the residents, with the exception of the village chief's advisers, who are appointed by the village chief.

Women's Voices

Before My Eyes

From Sudy Storm's Field Notes, 2007

During a survey of the households in a remote village of southeastern Sierra Leone, I met a woman who had survived the destruction of her village during the war. Hers is one of many such stories I have heard in my years as a midwife, and it shows the strength of the human spirit to survive unspeakable atrocities. The old woman stared at the ground in silence as I interviewed her son about who lives in his household. As I prepared to move to the next house, she raised her eyes and looked off in the distance. Slowly, she began to speak of the war and her husband. "The rebels came to the village before we could escape their wrath. They rounded everyone up and forced us into the center of town. As a rebel raised his gun and aimed it at me, my husband stepped in front of me. The bullet intended for me hit my husband, killing him before my eyes." The old woman lowered her eyes to the ground once again and grew silent.

—Sudy Storm

Chiefs are the guardians of the land, arbitrators of disputes, and influential in the economic development of the chiefdoms and villages. Sierra Leone has only a handful of female chiefs, particularly at the paramount chief level. One reason for the lack of female participation in civic and collective activities is the demands of agricultural and household duties placed on women. Furthermore, because of the patriarchal nature of the society, those women who are chiefs may not be allowed to exert their authority in matters of particular importance but be required to rely on resolutions determined by members of the male secret societies.

Village and chiefdom leaders and elders primarily handle legal matters and justice in the villages. When a crime has been committed, which is rare, or someone has a grievance against someone else, a committee of local leaders and elders is called, and the matter is resolved immediately through a mediation process. Women are included in these

village councils and may be asked for their opinions, but the male members make the final decisions. If one or both parties are not satisfied with the outcome of the mediation, they may go to the police or to local courts that will hear their case. The court may pass down a different judgment, but the decisions of the village council are usually upheld. In the urban areas, crime rates are much higher, and legal matters are handled by the police, military, and court system. A woman is free to bring a case against her husband if he is abusive or neglectful. Likewise, a man may seek justice and punishment for a wife that is disobedient or fails to fulfill her duties as a wife. The party found to be at fault might be required to pay restitution to the victim and a fine to the chiefs.

Despite the gendered inequality and inequity the women of Sierra Leone face, they have been instrumental in bringing peace and social change to their country. Their solidarity has historically been expressed through female cultural associations, such as the secret societies that organize and advocate for respect and recognition of female identity. Women's market associations have influenced trade and commerce in Freetown. The Women's Forum, a network of over 50 women's organizations, was established in 1994 to put an end to the war and move toward democracy. In August 1995 and February 1996, women showed their solidarity in two demonstrations calling for the military regime to step down. This Women's Movement for Peace played a leading role in the successful establishment of democratic elections at a time when the military government was attempting to maintain its power by postponing the elections.

During the war, women of all economic classes, educational levels, and ethnic groups came together to march and protest against the military government and rebel factions, sometimes putting themselves in danger. Today, these women's organizations are largely influenced by the nongovernmental organizations (NGOs) that seek to promote their international agendas for Sierra Leone. They are coalitions of well-educated, elite women advocating for inclusion in the political realm rather than inclusive grassroots organizations focused on the good of the nation as a whole. To some, this may appear to be progress, but for the poor and uneducated women of Sierra Leone, it does not advance their cause.

Religious and Cultural Roles

The vast majority of Sierra Leoneans are Muslims (60%) who primarily belong to one of three sects: Sunni, Shia, or

Ahmadiyya. The majority of the Christians in Sierra Leone are Protestants (Methodists and Evangelicals) and Catholics (CIA 2014). Indigenous animistic traditions are practiced by roughly 2 percent of the population, though they are combined with Muslim and Christian practices, particularly in the rural regions. Belief in evil spirits and witchcraft is prevalent and may be blamed for death or illness.

There is strong adherence to traditional gender roles that are based on patriarchal systems of dominance. Women are expected to obey all men, including husbands, fathers, uncles, brothers, and male coworkers. One woman told this author, "Women have to have men tell them what to do because they are not smart enough to know what is best. Men have to be in charge." Even in social, religious, and civic women's groups, men hold positions of power and authority.

Between the ages of 6 and 12, girls are placed into peer group secret society cohorts where they maintain lifelong membership. It is in these societies that girls are prepared for marriage and mothering. They are taught cooking and farming skills, appropriate marital behavior, and the stoic character expected in childbirth. Also included in their training are traditions of status within the family. For example, the first wife, called a Big Woman, has authority over subsequent wives and may even assist her husband in choosing additional wives. She is also responsible for training new wives in the customs and traditions of her particular family. Subsequent wives work under the supervision of the first wife and may be responsible for cleaning the first wife's room or doing her laundry. Co-wives assist each other with the household duties, farming chores, and raising of all children. If a husband is abusive or neglectful, wives may stand in solidarity to present their case to local chiefs who may force the husband to change his treatment of his wives if they believe he is not fulfilling his duties as a husband.

Women of Sierra Leone have strong traditions of gendered socialization. Members of secret society cohorts become lifelong friends and provide support networks for one another. These cohorts consist of Muslim girls, beginning around five to eight years of age, living in rural villages or urban neighborhoods. After the cohort is formed, they meet regularly with the respected elder women of their village or neighborhood, who train them in the ways of being a woman. A final initiation, which usually includes genital cutting, follows first menses and indicates a young woman's readiness and availability for marriage.

Co-wives form marital family bonds, and younger wives often care for older wives during the later years of their

lives when they are no longer able to work. Likewise, older wives assume a motherly role when a new, very young wife is brought into the family. The endless duties of household chores, farming, and child-rearing are shared among co-wives but also within village communities. Women will travel great distances to assist new mothers or care for sick relatives. The solidarity among the women of Sierra Leone is evident in their daily lives and strength of their kinship bonds. However, in urban areas, these traditions and customs are less pronounced, as families may seek a more independent, Westernized lifestyle.

Issues

Subsistence

Because of long-standing cultural customs of land inheritance, when husbands die, the land is given to their sons or brothers who, by custom, are responsible for providing for their female relatives. The Devolution of Estate Act of 2007 makes this illegal, but, to date, there has been little enforcement of the act or protection of women's rights to land. Because women are reliant on male family members to grant them permission to farm, it is difficult for single female heads of household to provide for themselves and their children. In one village survey, it was discovered that 25 percent of the heads of household were single women responsible for children and grandchildren. This high percentage of female heads of household is due in part to the deaths of husbands and male family members during the war. Sierra Leone is a very poor country in general, but women are the poorest citizens, particularly in the rural areas.

Additional challenges to women are the farming customs whereby the husband, brother, uncle, or father is responsible for making a farm for the women under his care. This means it is the man's duty to prepare the land for planting and then the women take over the plowing, planting, weeding, and harvesting of the crops. If a woman has no man willing to prepare a farm for her, she may not be able to provide for herself and her children, placing them all into a high-risk category for poverty, poor health, and lower life expectancy.

Gendered Violence

Women's experiences during armed conflict are often overlooked in the global discourse and human rights discussions. How forms of gendered violence affect them is

rarely researched or understood. The war that ravaged Sierra Leone was particularly brutal for women. Of those displaced within and outside of the country, 75–80 percent were women who had also suffered abandonment, widowhood, sexual violation, and living in flight or in camps for years. Young women and girls were kidnapped by rebel forces and forced into slavery, marriage, and motherhood. To survive, these women and girls did unspeakable things and witnessed horrendous atrocities. Many of them became the “bush wives” of rebel soldiers, living with them for several years and having their children. The Special Court of Sierra Leone was the first in the world to convict those responsible for these human rights violations of women and children.

When the war ended, women attempted to return to their villages and families only to be outcast and ostracized for their relationships with the rebels. It was believed that they were “polluted,” causing the loss of their social acceptance and rendering them unqualified to marry, unable to access their farms, and not allowed to achieve positions of social status within their communities. Many of these women and their children who were left destitute are beginning to make demands of access to the lands owned by their families and, in the case of widows, their deceased husbands. This social movement by the women was instrumental in the passage of the Devolution of Estate Act in 2007 that requires equal distribution of property between a deceased husband's wives and children. It is now a crime to expulse a widow from her home upon the death of her husband. This author has witnessed attempts by the leadership of village communities in southeastern Sierra Leone to not only abide by this law but to ensure that every man and woman over the age of 25 owns land. It would appear that progress toward gender equality is making strides in some village communities.

A Hopeful Future

The government of Sierra Leone has issued its “Agenda for Prosperity (AfP)—Road to Middle Income Strategy Paper for 2013–2018.” Pillar eight of this strategy is gender and women's empowerment. The paper states that discriminatory customs exacerbate institutionalized gender inequalities, particularly relating to marriage, property rights, and sexual offenses. Limited access to education, justice, health care, employment, and decision making are causal factors, and the government has committed to increasing gender equality and women's empowerment by signing a number

of policy declarations and enacting legislation. The goal of AfP “is to empower women and girls through education, reducing socio-economic barriers and supporting formal and non-formal education; increasing their participation in decision-making in public, private, and traditional institutions, and access to justice and economic opportunities; strengthening prevention and response mechanisms to violence against women and girls; and improving the business environment for women, with access to finance and capacity development” (Countdown 2013). Furthermore, the government plans to enact gender equality legislation; coordinate gender awareness and action within its ministries, departments, agencies, and civil society; and set up a National Women’s Commission. However, it has been difficult to translate these goals into developmental policy and practice due to infrastructure inadequacies and widespread corruption.

The women of Sierra Leone have a long history of struggle. They have survived the effects of colonialism and slavery and the tragedies of war and endured gendered oppression. But they persevere in improving their status and the living conditions of their communities through social change. National leadership is making progress in promoting equity for its female citizens, as evidenced by their recent legislative actions to empower the women of Sierra Leone. However, the Ebola epidemic that began in 2014 will place the health and lives of the women and children of Sierra Leone at risk as the national government and international health community struggle to provide services and resources to battle this deadly disease. The strength of the women will again be an important resource in the recovery of the republic of Sierra Leone.

Somalia

Overview of Country

Somalia is a coastal country in East Africa that rests on the Gulf of Aden and the Indian Ocean and borders Djibouti, Ethiopia, and Kenya. The country, which is slightly smaller than the state of Texas, covers approximately 389,809 square miles (627,337 sq. km) and consists of mostly flat desert terrain that rises to plateaus and hills in the northern regions (CIA 2016). The population of Somalia is about 10,428,043; however, it is important to note that population counting in this country is complicated because of the large number of nomadic people and refugee movements in response to famine and clan warfare (CIA 2016).

Somali society has often been considered ethnically (nomadic, pastoralist clans); religiously (Sunni Islam); and linguistically (Somali language) homogenous and egalitarian between classes and clans. New scholarship in the area of minority ethnic groups and castes has since come to light and revealed that Somali society, both historically and presently, is not as homogenous as was originally assumed. Politics and the economy throughout more

recent history have typically been controlled by majority clan leaders. During the time period of the civil war (1991 onward), majority group militias marginalized, oppressed, and exploited those of minority clans. With international aid and human rights work being undertaken in Somali in recent years, minority groups have started to assert themselves in Somali society and band together to create new group identities. The clan remains a large part of Somali social organization, but it is important to note that there are other relevant social identities that many Somalis identify with in response to ongoing oppression, marginalization, and exploitation.

Somalia was not listed in the UN Development Programme's (UNDP) Human Development Index (HDI) in 2014 due to lack of crucial data needed to accurately analyze HDI. The most recent year that Somalia was included in the HDI was 2012. Somalia's HDI was 0.285, ranking 165th out of 170 countries (UNDP 2014). Somalia also ranks low on the Gender Inequality Index (GII) at 0.775 out of 1 (complete inequality) and is in the fourth-lowest position globally (UNDP 2014). Some of the leading causes of gender inequality in Somalia are child marriage, widespread violence against women and girls, lack of educational opportunities, a high prevalence of female genital cutting (FGC), and low labor market participation for women and girls. Additionally, traditional and local laws are generally discriminatory against women.

Also contributing to Somalia's inequality and current state of conflict is its tumultuous history caused by colonialism. In 1960, British Somaliland, to the north, and Italian Somaliland gained independence from their colonial rulers. The two territories joined to form the Somali Republic, and on July 20, 1961, the Somali people, by popular referendum, ratified the new constitution. In 1969, the president was assassinated, and a military government took over by coup d'état. A military dictatorship ruled Somalia until 1991, when southern and northern clan forces ousted it; in the same year, Somaliland, in the north, seceded from the federal government and declared its independence. A civil war ensued, which disrupted agricultural production and food distribution and devastated the capital city of Mogadishu. These events led to a famine that killed 300,000 people.

In 1992, the United Nations deployed peacekeeping troops to the area, though it was a limited operation. By December 1992, the United States had formed a military coalition to create security for humanitarian operations

in southern Somalia as the humanitarian crisis worsened. This military intervention ultimately resulted in significant casualties, and the United Nations withdrew in 1995 with government rule still not restored.

In 2004, a Transitional Federal Government (TFG) was established and internationally recognized, though it did not garner widespread support in Somalia. In 2006, the United States backed the Ethiopian military in its intervention to drive out the Islamic Courts Union in Mogadishu. In 2007, the United Nations authorized the African Union to deploy a peacekeeping mission to support Somalia's fledgling federal government. The goals of this peacekeeping mission are to bring peace and stability to Somalia and to support the federal government's commitment to a fair electoral process. The election held on February 8, 2017, however, was heavily influenced by corruption and security concerns in a country beset by violence; no women ran for president. "A joint statement by the United Nations, the U.S., European Union and others warned of 'egregious cases of abuse of the electoral process.' Examples included violence, intimidation and men taking seats that had been reserved for female candidates, the joint statement said" (Tribune News Service 2017).

According to the United Nations, women and girls suffer disproportionately during and after conflict due to the breakdown of social and family networks, the magnification of existing inequalities, and the higher risk for physical and sexual violence and exploitation (UN News Center 2003). The colonial history of Somalia, which has resulted in protracted conflict into the present day, is a major contributing factor to the challenges and inequities that women and girls face in this country.

Girls and Teens

Somali women, especially girls and teens, are often viewed by many, particularly those in the Global North or Western world, as voiceless victims of conflict, culture, violence, and oppression. While Somali women face some of the most harrowing circumstances for women around the globe, it is imperative to acknowledge their resilience, their resistance, and their voices. It is the aim of this chapter to not only raise awareness and inform about the lives of Somali women and girls but also to amplify their stories as more than just the cries of helpless victims. This is a challenging task due to the political instability in the region, which contributes to a lack of official record keeping by both

the Somali government and entities such as the United Nations. However, there are other sources of Somali women's voices that can be examined to inform about the lives of Somali women and girls, such as poetry, novels, artwork, and oral traditions.

Oral Traditions

Somali women and girls have a strong, long-standing tradition of oral storytelling and poetry, particularly in the northern pastoral regions. Somalia, like many other countries around the world, including the United States, continues to be structured by patriarchy. Patriarchy is the sociopolitical system of male supremacy whereby men in the family, community, and at the state and legal levels control a disproportionate share of wealth and power. Even within this system of patriarchy, women and girls in Somalia have been making their voices heard through oral poetry and storytelling for many generations.

One of the ways in which scholars classify Somali oral poetry is by dividing it into time-free and time-bound categories. A historical narrative or poem connected with a known event or person would be considered time-bound, as it can be placed on the time scale in some way. Time-free poems consist of animal fables, a poem sung as a work song, or fictional narratives that cannot be placed anywhere specifically along the time scale. Popular love songs from 1944–1980, just before the fall of the centralized Somali government and toward the end of British colonialism, are of particular interest. The songs were written by Somali women and girls during this period of time, when major shifts were occurring within society. One love song, “In the Old Days,” provides a glimpse into the struggles of womanhood in Somali society during this time frame:

He (Maxammed Jaamac Jaaf): In the old days it was custom / that a girl perfumed her hair / and braided it. / She wrapped around her waist / a wide cloth belt with fringes and an ornamental cord / and wore a white dress. / But something has changed. / Something weird with long horns / they wear as hats on their heads / and run all over the market. / [Refrain] You, women, have destroyed our culture. / You have overstepped the religious law / and destroyed our religion. / Girls, won't you behave?

She (Mariam Mursal): What was custom in the old days / and a hundred years ago / and what has been left behind / don't make us go back on that well-worn road / for we have turned away from it with effort. / Now we

expect to run and compete / for the sun and the moon / and to lead people. [Refrain] First get some education and learn how to read and write. / Don't try to turn back, you country hick, people who have woken up.

He: In the old days it was custom / that a girl would not address you / for one or two months / and the men went out looking / would not see her for days. / But something has changed. / In the evening a whole group of them goes out/ carrying fat purses / wandering about outside like robbers. [Refrain]

She: God allayed the waters / of sea and river / and made them come together / and He put in order / the wide earth and the mountains / and created his human beings / each in a different way. / You are a loser. / No one is asking you to come along. [Refrain]

He: In the old days it was custom / to pay as bride-wealth for a girl / a whole herd of camels / and the most exceptional horse / and a rifle on top of that. / But something has changed. / You are self-absorbed / and ignore the advice / of your family of birth. [Refrain]

She: Girls used to be exchanged / for a herd of camels and short-legged goats. / But the religion we learned / and the Qur'an have not allowed this. / Today we have no need for / those who deal in what they do not own / and for this old-fashioned dividing up of women. [Refrain] (Kaptejins 1999, 59)

By uncovering the oral works of women and girls in Somalia, one can begin to piece together the ways in which gender norms and “traditions” have been embedded in and resisted by Somali society.

Education

Education in Somalia is managed and split between three different administrations: the Ministry of Education and Higher Education (MoEHE) of Puntland; the Ministry of Education and Higher Education (MoEHE) of Somaliland; and the Ministry of Education of the Federal Government of Somalia of Central South Somalia. Many of the schools established before the civil war have been destroyed or closed with little interest in state intervention to revitalize and rebuild them. For primary schools, the average teacher to student ratio is 33 to 1; however, this fails to take into account the disparities across the region because of the large population that lives a nomadic, rural lifestyle (UNICEF 2015). Although data coming from Somalia has been scarce, reports show that currently less than half of

students enrolled in grade one progress to grade five, and literacy rates, especially among school-age girls, are particularly low at 37 percent (UNICEF 2015). School-age girls face particular challenges specific to gender, such as menstruation, early marriage, and the need to drop out of school to help with farming and livestock.

There are programs that aim to reverse the trend in Somalia by bolstering the confidence of young women and girls and addressing circumstances that might prevent them from enrolling. The Puntland and Somaliland Ministry of Education (MoE) have established “Gender Units” to actively engage the community and help to mainstream issues of gender throughout the country. These units facilitate community outreach programs that broadcast issues of gender and education throughout Somalia’s radio and television services. They also educate teachers on the specific needs of young women and girls, such as menstruation, early marriage, and pregnancy. The units are funded through the Accelerated Female Participation in Education (AFPE) fund that allows for the distribution of sanitary kits and the sponsorship of scholarships for female students (UNICEF 2015). Other organizations include the Somali-based Daryeel Women Organization (DAWO), which addresses the topic of education as intersectional with other issues, such as health care access, financial stability, and food sovereignty and security as well as the participation of women in the political sector.

Health

According to the World Health Organization (WHO), life expectancies at birth in Somalia remain low at 51 years for males and 55 years for females, with infant mortality rates improving slightly from 134–224 per 1,000 births in 1999 to 86–135 in 2006 (WHO 2014). Maternal mortality rates in Somalia are among the highest in the world, with 1,044 deaths per every 100,000 live births (WHO 2014). Around 59 percent of the population practice a nomadic lifestyle and routinely have no access to social services; they also have a high rate of malnutrition and disease (Qayad 2007). Often, the stories of those who live a nomadic lifestyle or who are displaced are not included in these statistics, nor is the extent of their suffering well documented. The current health care status in Somalia has been aggravated by the ongoing internal conflict and the continued displacement of the population, especially in the South-Central zones. Several administrations utilized different strategies in regard to the formation of a health care system in Somalia,

and this discrepancy, lack of communication, and leadership stifled any further efforts to expand health services to the citizens. Other issues also affect the status of health throughout Somalia. Incidences of environmental degradation, droughts, famine, poor governmental organization, high rates of population growth, and urbanization make it difficult to organize a centralized health care system.

Access to Health Care

For women in Somalia, access to health care has been limited by the internal conflict; however, there are organizations started by Somali women that provide health care services to women and children throughout the country. Organizations established for and by women within Somalia and other countries in the region include Horn of Africa Relief and Development Organization (Horn Relief); Galkayo Education Center for Peace and Development (GECPD); WAWA (We Are Women Activists) Network; and Daryeel Women Organization (DAWO). In local Somali language, *Dawo* means “remedy,” and this organization aims to accomplish this through grassroots organizing and pooling of capital. DAWO’s mission is to help women and children attain self-sustainability and peace within their communities to facilitate health improvement and environmental protection without the need for foreign intervention. WAWA is a network that established itself with the principal belief that they could not succeed without the involvement and continued activism of Somali women (WAWA 2015).

Maternal Health

Only 9.4 percent of live births in Somalia are attended by a skilled health care worker; the density of nurses and midwives per 1,000 women is 0.1 percent (WHO 2014). What these statistics do not include, however, are the number of traditional midwives who have received little to no formal training but who have extensive knowledge in traditional childbirth care. Traditional birth attendants (TBA) in Somalia are women who assist mothers before and during childbirth who have acquired their knowledge through participating in deliveries themselves or through completing an apprenticeship through other TBAs. A TBA has social ties with the community and works closely with the mother throughout her pregnancy, often residing near or in the mother’s household. Although the mothers are aware that childbirth can be safer at health care facilities,

they routinely choose the service of a TBA, especially in the poor rural regions (Pyone et al. 2014).

With Somalia currently lacking a central government since 1991, the main threat to the lives of women is not the consequences of war, but the process of childbirth and the lack of antenatal and postnatal care. Lack of knowledge and isolation also contributes to the high rate of infant mortality, as women do not have the resources or connections needed for them to have access to care. However, many women consciously select not to rely on modern postnatal facilities by choice rather than lack of access. Many Somali women choose not to seek postnatal care after experiencing few or no complications after giving birth, resulting in only one in four mothers seeking treatment (Deyo and Bartlett 2012). Mothers in Somalia often have a distrust of government and nongovernmental organizations (NGOs), which are regularly structured with high fee rates, poor service, unskilled staff, and a lack of supplies. Given the reputation of these facilities and the improving but still dismal maternal and infant mortality rates, women are making conscious, informed decisions regarding maternal health care.

Diseases and Disorders

Major diseases of concern in Somalia include but are not limited to tuberculosis (TB), hepatitis A and E, typhoid fever, malaria, dengue fever, HIV/AIDS, acute watery diarrhea (AWD), and cholera. Of these health concerns, there are three that emerge as major threats to the population of Somalia, especially women and children: tuberculosis, HIV/AIDS, and AWD. Continued instability in the country has led to the degradation of the sanitation of water and safe water infrastructure that existed prior to the internal conflict. It is estimated that only 10 percent of the rural population and 63 percent of the urban population have access to improved sanitary water conditions (Brown n.d.). These circumstances culminate to produce an environment that supports the reproduction and distribution of waterborne parasites that carry disease to the human population as well as to their livestock.

The Centers for Disease Control and Prevention (CDC) reports that, in 2005, the estimated rate of tuberculosis was 224 per 100,000, and in 2004, 1.4 percent of new TB cases were resistant to multiple drugs, with 56 percent of cases presenting as extrapulmonary (CDC 2008). Drug use throughout Somalia, especially use of a narcotic leaf called “qat,” which is traditionally chewed by men, contributes to

the spread of TB. Qat-chewing sessions are a social activity that often takes place in rural areas in small confined huts with several men packed tightly together. Men who contract TB through these sessions can, often without knowing, spread the disease to their wives and sexual partners. According to the CDC’s report, women are less likely to contract the disease through substance abuse, but they are continually at risk of infection through their male sexual partners or male relatives (CDC 2008).

Employment

Employment for women in Somalia varies from region to region. A 2011–2015 UNDP Gender Brief states that female participation in specifically nonagricultural jobs is 33 percent in South Central Somalia, 36 percent in Somaliland, and 40 percent in Puntland (UNDP 2015, 2). Due to near constant conflict in and outside Somalia, more and more women have had to step forward as leaders within their families. Women are “increasingly tak[ing] on roles as providers of basic needs—particularly as these are often extracted from scarce natural resources (land, water, vegetation, etc.)” (UNDP 2015, 4). The largest industries across Somalia are agriculture and pastoralism.

Many high-paying jobs rest within these industries, but success in these areas remains crushingly unattainable for women. This is largely due to the prevalence of a clan system of decision making called *siya*. These clans are run by groups of elders to whom all problems are brought and by whom they are resolved. These groups are exclusively male and go so far as to forbid women from attending or going near meetings. One career that women have been drawn to, as the main breadwinners of their families, is work as street vendors and small shop owners. But they generally lack the skills and capacity to grow their businesses (UNDP 2015, 4). No evidence of laws that protect women in the workplace can be found.

Family Life

Women in Somalia are central to the family unit, which presents as a well-organized kinship network of relatives and social ties throughout the community. The family goes beyond the nuclear unit and often includes elder relatives, cousins, uncles, aunts, and family friends who are close to the husband (Somaliland Cyberspace 2015). Being a patrilineal society, domestic units usually consist of a man at the head of the household, his wife or wives, and

their children. When there is the need for a separation or divorce, the children remain with their mother and retain inheritance rights through their father. Polygyny is commonplace in rural Somalia. Each wife resides in her own home with her children, separate from the other wives. Women in polygamous relationships form close bonds with one another and often pool their resources and share in the care of children, livestock, and personal costs. Many men were killed during the armed conflict and have died from diseases such as tuberculosis and HIV/AIDS. In their absence, women began to self-organize unions that handle matters of family business and property management; they have even created credit unions for times of hardship.

Power dynamics within the family in precolonial times left women in a submissive role, though not without great influence on the family unit. Today, women continue to be responsible for all the labor of farming, raising livestock, delegating responsibilities to children, and, often, educating the children. Women hold more power as a sister or daughter than as a wife or daughter-in-law. As daughters, they hold claim to half of their father's inheritance, and brothers are fiercely protective and accommodating to sisters (Somaliland Cyberspace 2015).

Marriage

In precolonial Somalia, traditional wedding ceremonies, called *nikaah*, were less about the union of two people and more centered on the union of two family or clan kinship networks. Organized as a large party, the *nikaah* is attended by the entire extended family and friends and is not completely focused on the bride and groom. As some women partake in traditional singing and dancing, other women work to prepare the traditional dishes and treats to be served. The ceremony is presided over by a Muslim sheikh, keeping in observance of Islamic law in a symbolic union and contract between the two families. Traditionally, there is a bride-price, or dowry, paid to the bride's family by the family of the groom that consists of a dozen or so female camels. In modern times, however, the dowry remains but cash is preferred, with fine gold jewelry given to the bride by the groom's family as insurance in case of divorce (Visual Peace Media 2013).

LGBTQ Justice

LGBTQ rights in Somalia are not protected by law. Currently, same-sex relationships are illegal in Somalia, and same-sex relationships and sexual acts are punishable by

imprisonment. In some parts of Somalia, any sexual orientation that is not considered heterosexual is punishable by death (Amnesty International 2014). Unfortunately, information about the LGBTQ community in Somalia is scarce because of the harsh penalties in place for identifying outside of heteronormative sexual or gender identities.

Under Article 409 Homosexuality, the law states, "Whoever has carnal intercourse with a person of the same sex shall be punished, where the act does not constitute a more serious crime, with imprisonment from three months to three years. Where the act committed is an act of lust different from carnal intercourse, the punishment imposed shall be reduced by one-third."

Article 410 Security Measures reads, "A security measure may be added to the sentence for crimes referred to in Articles 407, 408, and 409."

The political climate in Somalia is still complicated due to the fall of the government in 1991; therefore, the enforcement of the national penal code can be questioned. Somaliland, in the north, has declared itself an independent state and continues to enforce the Somali Penal Code about same-sex relationships.

Politics

In Somalia, there are two semiautonomous states, South-Central Somalia and Puntland, which fall under the Somali Provisional Constitution drafted in 2012 (USIP 2017). In addition, there is another state called Somaliland, which seceded from Somalia and declared its independence in 1991 (UNDP 2015, 9). Somaliland has its own constitution that varies slightly in its stances on women's rights; it also recognizes various international human rights instruments that the provisional constitution of Somalia does not (6).

The federal government of Somalia has ratified three out of the four international bills on human rights as well as the African (Banjul) Charter on Human and Peoples' Rights. The provisional government's constitution reflects some positive and some negative implications on women's rights. Articles 3, 11, and 22 guarantee female inclusion in national institutions (particularly in regard to elected positions within the government), equality before the law, and the right of political participation (5).

However, the federal constitution is often not followed. When Somaliland seceded from the government in 1991 and Puntland became a semiautonomous state within the Somali federal structure in 1998, the entire country

reverted to clan-based government. Using customary law alongside sharia and *Xeer*, both of which are systems of belief and law based in Islam, the country's most commonly practiced religion. Sharia law actually contains many laws that could benefit women, most revolving around a woman's ability to inherit land and livestock from her male family members (5). But once again, these aspects of law are rarely applied. The men lead the clans and interpret the laws. Women are not even allowed to attend hearings that involve them; therefore, the interpretations of law almost always fall in favor of the men involved.

Religious and Cultural Roles

The overwhelming majority of the population of Somalia is Sunni Muslim (99.8%) (PEW 2012, 49). Therefore, Somali women are expected to live according to the tenets of traditional Islam, albeit with certain beliefs incorporated from tribal religions that predate Islam (LOC 2017). Most citizens believe in Allah as the one true God, though most still hold beliefs regarding ancient spirits that can possess the body and cause many illnesses.

Issues

Women in Somalia face hardship at every turn. Civil war and conflict put more and more pressure on women to take care of their families. The return to clan-based politics shut women out of any kind of political participation. Misinterpretations of Islam and misguidance of clan leaders allow traditions such as the practice of female genital cutting and mutilation (FGC/FGM) to continue, even with the knowledge that it provides no benefit to a woman's health and can in fact cause health issues. An FGM advocacy paper by UNICEF presents several case studies, each one showing the various stages of abolishing FGM in Somalia. Many Somali are beginning to understand the devastating effects FGM has on women in their community. With an FGM rate of 95 percent in Somalia, according to UNICEF, it is clear how widely accepted the practice is. UNICEF hopes to end FGM through the education of Somali mothers, daughters, medical practitioners, and religious leaders. With time and patience, the people of Somalia will accept that the practice is not necessary and will abolish it themselves.

The continuous conflict inside Somalia has internally displaced its own citizens since the fall of the state in 1991 (Hammond 2013, 1). Between 1990 and 1994, 2 million

Somali and 75,000 external refugees were displaced into camps throughout Somalia. In these refugee camps, there is little to no governmental supervision. As a result, they quickly became hostile places for anyone to be, but especially women and children. Physical, mental, and sexual abuse, including rape, are common, though statistics are difficult to find due to the lack of oversight. Currently, there are still more than 2 million internally displaced women in Somalia (USIP 2017).

Somalia is rife with sexual abuse. According to the UNDP, "During the month of September 2012, UN partners registered 277 cases of sexual violence in Mogadishu alone—237 of which were rapes" (UNDP 2015, 1). Statistics outside of major cities are difficult to come by, but if Mogadishu is any indication, the situation is dire across the country, particularly in internally displaced persons camps, where a majority of sexual assaults are committed by men in uniform (1).

South Africa

Overview of Country

South Africa is located on the southernmost tip of Africa and borders Botswana, Limpopo, Mozambique, Namibia, Swaziland, and Zimbabwe. It is the 25th-largest country in the world, covering 471,011 square miles (1,219,090 sq. km). It is topographically diverse and has access to both the Indian (west) and Atlantic Oceans (east). As of July 2015, the population of South Africa was 54,960,000, with approximately 28,070,000 (51%) of the population being female. The racial profile of women in South Africa was as follows: 80.4 percent African (black), 8.9 percent colored (mixed race), 2.4 percent Indian, and 8.3 percent white (Statistics South Africa 2015d). Indigenous South Africans are from multiple tribes throughout the nation, and South Africa has 11 official languages.

South Africa has a history of violence and segregation. Apartheid was a system of racial segregation enforced by the ruling political party through legislation and violence between 1948 and 1994. This system affected access to basic services as well as economic opportunities for black, colored, and Indian South Africans as well as other ethnic minorities. The legacy of this structural system of inequality and violence continues to affect the ability of women to access equality.

Gender equality is enshrined in the South African Constitution (1996), and South Africa has extensive legislation furthering gender equality and preventing discrimination on the grounds of sex, gender, and sexual identity.

Despite this, the legacy of apartheid socioeconomic inequality, high levels of violence against women, and widely held patriarchal values create a context of inequality for women. In 2014, the UN Development Programme ranked South Africa 83rd out of 187 nations based on the Gender Inequality Index (GII, 0.407).

High levels of violence against women prevail, with more than 1 million contact crimes against women (e.g., assault, assault with the intention to do grievous bodily harm, sexual offences, murder) reported to the police between 2007 and 2013 (South African Institute of Race Relations 2013). Women in South Africa are more likely to be poor, unemployed, and HIV positive than men. Yet, at the same time, the representation of women in government and parliament is among the best in the world (Inter-Parliamentary Union 2015).

Girls and Teens

As of 2015, the population of adolescent females between 15 and 19 years old was 2,559,030, with a further 8,252,643 girls under the age of 15 in South Africa (Statistics South Africa 2015d). Thus, just over one-third of all women in South Africa are under the age of 19.

Adolescent Fertility

The World Health Organisation (WHO 2015) estimated that for the period of 2007 to 2012, South Africa's adolescent fertility rate was 54 births per 1,000 girls aged between 15 and 19 years old. Births to adolescent mothers made up less than 10 percent (8.9%) of all births in 2009. This percentage varies by region and was highest in the Eastern Cape, Northern Cape, and Mpumalanga and lowest in Gauteng.

The General Household Survey also examined the extent of teenage pregnancy in South Africa (Statistics South Africa 2015b). The survey found that the prevalence of pregnancy increased with age, from 0.8 percent for females aged 14 years to 11.9 percent for females aged 19 years.

A contributing factor to adolescent pregnancy is the lack of condom use during sexual activity. A 2010 Medical Research Council Survey found that 17.9 percent of learners between grade 8 (13 years old) and grade 11 (17 years old) who had already had sex did not use any contraception at all. Pregnancy is not the only negative consequence of sexual activity during adolescence, and this type of activity puts young women at risk of contracting HIV, especially when their partner is older (i.e., transactional sex).

A challenge to addressing adolescent fertility and teenage pregnancy is the lack of a national standardized policy on the matter. Adolescents are legally allowed to access sexual and reproductive health services; however, community and social norms often create stigma around this access. Similarly, pregnant teens are sometimes prevented from continuing with their education despite this being a legal right in the constitution. In 2008, 13 percent of all girls between the ages of 13 and 19 who dropped out of school in South Africa did so because they were pregnant (UNICEF 2013).

Education and Literacy

At a primary school level, the gross enrollment ratio is slightly higher for boys (104%) than for girls (99%). However, the net enrollment ratio is slightly higher for girls (91%) than boys (90%). Overall, these figures indicate that South Africa is on target for parity in education. It is of concern that 10 percent of all children of primary school age are not in school (UNICEF 2015a). While enrollments are good, information on the number of children who remain in the system to complete their education is not readily available. In addition, in 2015, the World Economic Forum ranked South Africa 140th in the world in terms of the quality of schooling, and 144th in terms of the quality of mathematics and science education (World Economic Forum 2015).

In terms of the youth (15–24 years) literacy rates, the average youth literacy rate was 99.2 percent, with the female youth literacy rate slightly higher than the average at 99.5 percent (UNESCO 2013).

Education

The right to education is enshrined in Section 29 of the Constitution, which states, “Everyone has the right to a basic education, including adult basic education; and to further education, which the state, through reasonable measures, must make progressively available and accessible” (Constitution of the Republic of South Africa 1996). Primary and secondary education are discussed in the section on girls and teens; therefore, this section focuses on postsecondary education.

Undergraduate University-Level Education

In 2015, a number of student protests took place around the affordability of tertiary education under the campaign

#feesmustfall. Many young people in South Africa do not receive strong enough results in their secondary education testing to enter tertiary education at all. Of those who do qualify for tertiary education, many struggle with the financial means to access such education.

In terms of tertiary education, by 2012, women made up 58 percent of all enrollments (South African Department of Higher Education and Training 2014). Of the 457,387 women who enrolled for undergraduate courses in 2012, 65.54 percent enrolled for degrees, and the remaining enrolled for diplomas. And 55.4 percent were enrolled in contact learning, with 44.6 percent enrolled in distance learning. Similarly, female graduates were more likely to be enrolled in contact learning than distance learning. Of female students who achieved an undergraduate qualification in 2012, 57.69 percent earned a degree; the others earned a diploma or certificate. In terms of course success rates, women performed slightly better than men, with 78 percent of women and 74 percent of men completing their courses in 2012.

The highest number of women's enrollments was in the business and commerce fields (29%), followed by humanities (26%), education (23%), and science, engineering, and technology (SET) fields (22%) (Council for Higher Education 2014).

University-Level Education (Postgraduate)

At the postgraduate level, women outnumbered men in enrollments up to honors level; thereafter, men outnumbered women. Despite women outnumbering men at universities, men remain more likely to get a doctoral degree than women.

Literacy

UNESCO (2013) estimated that by 2015, South Africa would have an adult overall literacy rate of 94.2 percent, with the female adult literacy rate slightly lower than the average at 93.2 percent. It was further estimated that women make up 58.7 percent of the adult illiteracy population.

Health

Health Care Access and Overview

The right to health is included in South Africa's Constitution in Chapter 2, which states that "everyone has the right to have access to health care services including reproductive health care; and no one may be refused emergency medical treatment" (Constitution of the Republic of South Africa 1996).

Women's Voices

Nadine Gordimer

Nadine Gordimer was a South African writer and political activist. The subject matter for her novels and short stories was the violence and negative impact of apartheid on the people of South Africa. Through her writings, she became a bold campaigner against racism and an outspoken promoter of free speech. Several of her books were banned by the government, including *The Late Bourgeois World* (1966) and *Burger's Daughter* (1979). She was a leading member of the African National Congress and fought for the release of Nelson Mandela. In 1991, she was awarded the Nobel Prize in Literature. The Nobel Committee honored Gordimer's writing as having been "of very great benefit to humanity" (Nobelprize.org 2014). In her later years, she became active in HIV/AIDS causes.

—Karen G. Massey

Nobelprize.org. 2014. "Nadine Gordimer—Facts." Retrieved from http://www.nobelprize.org/nobel_prizes/literature/laureates/1991/gordimer-facts.html.

Public health expenditure made up around 14 percent of the South African government's expenditures in 2015. Only 16 percent of the population is on medical aid, and the likelihood of being on medical aid remains determined by race. African South Africans are least likely to be on medical aid (11%), and white South Africans are most likely (76%) (South African Institute of Race Relations 2016). This discrepancy speaks to the lasting effects of racial apartheid.

There are five categories of public hospitals in South Africa: district, regional, tertiary, central, and specialized. Each category offers different levels and types of services. Most hospitals in the country are district hospitals (65%). Clinics provide primary health care services in many communities, but they are only open during the day for about eight hours. They are run by professional nurses with training, and are supported by visiting doctors from the district. There were 407 public hospitals and 3,182 clinics in South Africa as of 2014 (Health Systems Trust 2015). In addition, there were a further 203 private hospitals across the country. This translates to 116,429 hospital beds in the country.

Although health care facilities of some form are thus available for many South Africans, there remain challenges to achieving good maternal health coverage, and challenges with diet and other health factors have a significant impact on women's health in South Africa.

Life Expectancy and Death

As of 2015, South African females have a higher life expectancy than males at birth; the life expectancy of females as of 2015 was 64.3 years, and for males, it was 60.6 years (Statistics South Africa 2015d). Life expectancy has been steadily increasing over the past decade.

Where cause of death is specified, the leading cause of death among females was tuberculosis, followed by diabetes mellitus and cerebrovascular diseases. Transport deaths were the leading specified cause of nonnatural deaths among females in 2013 (13.3%) (Statistics South Africa 2014b). Assault and medical and surgical care complications are the other leading nonnatural causes of death for women. However, "other external causes of accidental injury" represented 57.6 percent of nonnatural causes, amounting to 6,369 deaths.

Maternal Health

Although health care facilities of some form (clinic, hospital, general practitioner rooms) are available for many South Africans, there remain challenges to achieving good maternal health coverage, and the number of maternal deaths remains high.

Prenatal and Postpartum Care

South Africa's high maternal mortality rate has been linked to poor uptake of prenatal care. High HIV infection rates require good prenatal care to ensure that women are able to participate in the Prevention of Mother to Child Transmission Programme, whose aim is to reduce the transmission of HIV in South Africa. In addition, prenatal care can save lives by identifying risk factors such as hypertension and diabetes.

The 2014–2015 Department of Health targets for prenatal care included a goal of 65 percent of pregnant women in that year having their first visit before 20 weeks of pregnancy; however, only 53.9 percent of women met this target. The Department of Health attributes this low uptake to multiple factors, including cultural beliefs. However, between 2013 and 2015, there has been an increase in the proportion of women accessing this service (South African Department of Health 2015a).

Many rural women face challenges in returning to facilities for postnatal care, including a number of traditional customs that require women to stay indoors for a specified period after birth. Attempts to address this include ward-based outreach teams who follow up with new mothers and link them to postnatal care.

Childbirth Attendants and Practices

UNICEF (2015b) estimated that by 2008, 94.3 percent of all births were attended to by a skilled attendant in South Africa. An estimated 95 percent of all births took place within a health care facility.

Breastfeeding and Infant Feeding

The most recent data on breastfeeding was from 2003 and noted that 81.5 percent of infants had been breastfed. However, only 11.8 percent of babies under four months had exclusively been breastfed. Of babies under six months, this dropped to 8.3 percent. It should be noted that the sample sizes for these surveys were small (WHO 2010).

Maternal Mortality Rate (MMR)

South African women have a 1 in 300 risk of maternal death (UNICEF 2015b). More maternal deaths occurred between 2008 and 2010 than in any previous years. The five leading causes of maternal death were nonpregnancy-related infections (largely caused by HIV infection complicated by illnesses such as tuberculosis or pneumonia); complications caused by hypertension (high blood pressure) during pregnancy; obstetric hemorrhage; pregnancy-related sepsis; and medical and surgical disorders. The top three causes account for almost 70 percent of all deaths (South African Department of Health 2012).

Maternal deaths are often avoidable or preventable. The fifth report on the confidential inquiries into maternal deaths in South Africa notes that maternal deaths due to obstetric hemorrhage were possibly and probably preventable in 81 percent of cases, and deaths caused by hypertension were possibly and probably preventable in 61 percent of cases. In 53.4 percent of all deaths, different management might or would reasonably have been expected to make a difference to the outcome (South African Department of Health 2015a).

In 2014, the Department of Health launched the Mom-Connect project to try to improve the uptake of prenatal and postpartum care. The project uses cell phone technology to register pregnant women in public and private

health care and sends them regular alerts and instructions related to their health care prior to birth. For one year after delivery, the messages contain information about the health needs of newborns. In the first eight months, the department registered 383,354 pregnant women on the system (South African Department of Health 2015a).

Access to Termination of Pregnancy

The South African Constitution makes provisions for women to make choices relating to their reproduction. In Section 12 of the Bill of Rights, it states that everyone has the right to bodily and psychological integrity, including the right to make decisions concerning reproduction. Consequently, the Choice on Termination of Pregnancy Act 92 of 1996 was passed.

Diseases and Disorders

HIV

As of 2015, an estimated 11.2 percent of the total South African population was HIV positive; 16.6 percent of the adult population is HIV positive. The median time from HIV infection to death was 10.5 years for men and 11.5 years for women. For every two men aged 15 to 49 years infected with HIV, three women are infected with the virus. In addition, as of 2015, almost one-fifth of South African women in their reproductive ages are HIV positive (Statistics South Africa 2015d); women aged 15 and older living with HIV represent 57.35 percent of the people living with HIV in South Africa (UNAIDS 2014).

In 2012, more men than women indicated that they had used a condom in their last sexual act (Shisana et al. 2014). Condom use at first sex increased from 18 percent in 1992 to 66 percent in 2012 (South African Institute of Race Relations 2013). Research indicates that people who use condoms during their first sexual experience are more likely to use them throughout their lives; thus, it is important that condoms continue to be distributed throughout the public health system and that sexual education programs focus on condom use.

Given unequal gender relations that can make it difficult for women to negotiate the use of male condoms during sex, women should be empowered to choose a female condom if they would like to. Condom distribution, particularly of female condoms, could be increased. In the 2014–2015 period, only 28 percent of these condoms were female condoms (South African Institute of Race Relations 2016). Gender-based violence is extremely prevalent in

South Africa, and this contributes to the spread of HIV by increasing the risk of transmission.

Other Health Issues

In 2014, the primary chronic conditions diagnosed by a medical practitioner or nurse were hypertension, diabetes, and HIV/AIDS (Statistics South Africa 2015b). As of 2004, men were far more likely than women to have an alcohol or drug abuse disorder. South African females were less likely than males to smoke. Only 8.2 percent of females smoked at the time of the survey. Women are less likely than men to commit suicide, with the adult suicide rate of 1.1 females per 100,000 as of 2012 (WHO 2016). In terms of access to mental health care, there is a 75 percent probability that those who cannot access private health care will not receive the professional attention they require (Health Systems Trust 2015).

Disability

About 7.5 percent of people in South Africa are living with disabilities. Of those with disabilities, 1,682,071 (58.61%) were female. Sight disabilities were the most prevalent form of disability among women in South Africa. Disability has an impact on education, income, and likelihood of employment. Males with disabilities were more likely to attend secondary school than females (Statistics South Africa 2014a).

Disparities between women and men with disabilities in employment exist. Males with disabilities earned double that of females with disabilities, regardless of the severity of the disability (Statistics South Africa 2014a).

Employment

Labor Force Participation and Unemployment

As of April 2015, there were 18.3 million women of working age in South Africa (South African Department of Women 2015). Between 2009 and 2014, the number of employed persons in South Africa increased; however, there was also an increase in the number of unemployed persons (Statistics South Africa 2015c). South Africa ranked 84th out of 144 countries in the Global Competitiveness Index for female participation in the labor force in 2015, a slight improvement from the 2013 position of 88th out of 148 (World Economic Forum 2015).

The unemployment rate for women has been consistently higher than the national unemployment rate. The expanded definition of unemployment includes discouraged work seekers and those who could be economically active but are not. Using the expanded definition, the female unemployment rate was as high as 34.9 percent, whereas the male unemployment rate was 31.1 percent. Thus, using this definition, the female unemployment rate is 3.8 percent higher than the male unemployment rate (Statistics South Africa 2015c).

Employment by Industry and Occupation

Most employed women in 2014 were involved in trade or in community and social services (including government). Men outnumber women in every sector of industry except community and social services and “other,” where they are in equal numbers. The industry with the highest percentages of women was private households (77.4%), likely indicating domestic cleaning work.

The sectors that women are employed in have a significant impact on their earnings. Between 2010 and 2014, earnings increased in all industries except community and social services, where a decrease was observed. This is the category where almost one-third of all employed women work. The largest increases in earnings were observed in mining and utilities, where women are least likely to be employed.

Women make up the majority of technicians, clerks, and domestic work. In all other occupations, men are dominant. Women make up less than one-third of all managers in South Africa. Grant Thornton International (2015) notes that there has been very little change in terms of senior roles held by women in South Africa since 2004. When salaries are considered, this has significant impact.

Earnings

The average monthly earnings of employees in the formal nonagricultural sector was 16,461 rand (USD\$1263) (Statistics South Africa 2015e). Women earn 900 rand (USD\$69) less per month than men in general, but this varies depending on the sector. In sectors such as utilities and transport, women earn more than men.

Employment Equity

South Africa has a state entity, the Commission for Gender Equality, that seeks to evaluate the level to which gender equality is enforced in all sectors. The latest reports (2014)

indicate that men, especially white men, are most likely to be in positions of senior and top management.

Access to Family and Maternity Leave

Only about half of South Africans had access to maternity or paternity leave at their workplace (Statistics South Africa 2015c). By law, employees are entitled to at least four consecutive months of unpaid leave, and employers are not required to pay them during this time, although many do. Slightly more women than men have access to these benefits. Benefits are most likely to be provided in the mining and electricity sectors, and they are least likely to be provided in private households and agriculture sectors. Because women are more likely to be employed in these sectors, this has a significant impact on women's ability to enter and remain in these careers while raising children.

The Department of Women (2015) notes that the female labor force is slightly older because women are more likely to exit the labor force during their childbearing ages and return later on.

Family Life

Marriage and Divorces

There are three ways of getting married in South Africa: civil marriage, customary marriage, and civil union. Civil unions are for same-sex marriages. Each of these types of marriage is recorded differently because they apply under different laws. In 2014, registrations took place for 150,852 civil marriages, 3,062 customary marriages, and 1,144 civil unions (Statistics South Africa 2015a). The number of civil unions in 2014 was the highest on record since 2003. In contrast, both the number of civil marriages and the number of customary marriages recorded in 2014 were the lowest recorded since 2003 (Statistics South Africa 2015a).

Age at the time of first marriage is considered an indicator for the status of women's rights and experience of equality worldwide. A later age reflects the possibility of women having alternative life options (e.g., education, employment). South Africa still allows marriages for children under the age of 18, but with restrictive conditions. Minors under the age of 18 must have the consent of a parent or guardian or the commissioner of welfare. In addition, boys under 18 years old and girls under 16 years old require the consent of the minister of home affairs. Despite these restrictive conditions, marriages of young

brides still occur far more often than marriages of young bridegrooms. For example,

- In 2012, 9 bridegrooms and 206 brides under the age of 18 were registered; 2 of the bridegrooms, and 13 of the brides had been married before.
- In 2013, 14 bridegrooms and 172 brides under the age of 18 were registered; 1 bridegroom and 12 brides had been married before.
- In 2014, 10 bridegrooms and 131 brides under the age of 18 were registered; 6 of the brides had already been married before. (Statistics South Africa 2015a)

Positively, the number of brides under the age of 18 is decreasing each year, but it is still of concern.

In 2014, there were 24,689 divorces, 51.7 percent of which were initiated by women. It is positive to note that women are economically and emotionally able to exit relationships they are not happy in. Most divorces occurred in marriages that had lasted less than 10 years. A total of 22,218 children under 18 years of age were affected by divorces that took place in 2014 (Statistics South Africa 2015a).

Fertility

South African fertility has declined since 2001, with the 2011 data indicating a fertility rate of 2.67 per woman in South Africa. This rate varies by race, with the levels of fertility among African (2.82) and colored (2.57) population groups higher than those of white (1.70) and Indian (1.85) population groups (Statistics South Africa 2015a).

The proportion of women who indicated that they were childless was highest among the 15- to 19-year-old age category (86.1%) and declined thereafter. In the 20–24 age category, 50.9 percent of women were childless. This decreased to 29.5 percent for the 25- to 29-year-old category and further declined thereafter. This mirrors the patterns described by the birth statistics in the health section. After the age of 25, more than two-thirds of women had children (Statistics South Africa 2015a).

The most common age for women when they first give birth is between 18 and 20 in the 2011 census. Fewer than 5 percent of births occurred after the age of 30 years of age. The mean age at first birth was 21.8 years (Statistics South Africa 2015a).

These figures are important in South Africa because the earlier women start giving birth, the more children they are likely to have. Women who had first given birth at an

age younger than 15 years had a mean number of children of 4.18. In contrast, women who had given birth at 25 or older had an estimated 2.55 children. The proportion of women aged 45 to 49 years of age who only had one child was highest when women had first given birth at age 25 and above (Statistics South Africa 2015a).

Education levels continue to influence the likelihood of having children and the number of children a woman will have. Higher educational attainments are linked to lower average number of children. The average number of children born to women who had given birth when they were younger than 15 was highest among women who had no education (4.4 children) and lowest among women with higher education (2.9 children) (Statistics South Africa 2015a).

Household Roles and Responsibility

Despite legislative gains in terms of gender equality, household roles and responsibilities remain traditional, regardless of whether women are employed. Women are more likely to do the housework than males, and they likely to spend more time on caring for family and children. A gendered analysis of time allows governments to understand the impact and benefits derived from certain policies. It is a good indication of where women face barriers to entering and remaining in the workforce and to the social norms that reinforce gendered inequality. Statistics South Africa notes that “in general the responsibility of household work and caring for children and the elderly lies with women more than it does with men” (Statistics South Africa 2013b).

The most recent information on use of time is the 2010 Survey of Time Use prepared by Statistics South Africa, which provides a good indication of the gendered division of labor within homes. These participation rates indicate how likely the respondents were to participate in that type of activity. Personal care includes activities such as sleeping and eating, hence the high participation rates. A significant difference emerges between the participation rates in household maintenance and care of persons, with women 18 percent more likely to perform household maintenance than men and 21.1 percent more likely to take care of others (Statistics South Africa 2013b).

For women, household maintenance was the second-highest rate of participation, whereas men were more likely to participate in mass media use or social and cultural activities than household maintenance. In contrast, men’s participation rate was higher for work in establishments,

primary production, and learning than women's. On average, women spent 107 more minutes per day on household maintenance than men, and men spent 54 more minutes at work establishments than women (Statistics South Africa 2013b). Men spent 34 more minutes than women on average on social and cultural activities and 14 more minutes on mass media consumption.

Women spent 24 more minutes than men per day on the care of persons. Overall, female respondents were three times more likely to participate in the care of persons than male respondents. When a child under the age of seven was living in the household, males spent a mean of 13 minutes on child care per day, whereas women spent a mean of 80 minutes (Statistics South Africa 2013b).

Household Heads

As of 2008, most households indicated that a male was the decision maker and head of household, with only 39.8 percent of households surveyed headed by women. The likelihood of a household being female-headed was influenced by race. Only 22.3 percent of white households were headed by women, whereas 43.8 percent of African households were headed by women (Statistics South Africa 2013a).

As of 2015, female-headed households were more likely than males to receive a housing subsidy from the government as a result of a policy that targets the provision of households to vulnerable groups (Statistics South Africa 2015b).

Sexuality and LGBTI Rights

South Africa's Constitution protects the right to be free from discrimination on the grounds of sexual orientation, and South Africa was the first country in Africa to legalize same-sex marriage through the Civil Unions Act in 2006. Other legislation that protects and promotes the rights of LGBTI persons is discussed below. However, South Africa remains a patriarchal society, and LGBTI persons remain extremely vulnerable in terms of access to health care services and justice.

The Protection of Equality and Prevention of Unfair Discrimination Act (2000) protects against harassment on the grounds of sexual orientation. The Domestic Violence Act (Act 116 of 1998) provides legal protection from violence in same-sex partnerships. The Alteration of Sex Description and Sex Status Act (Act 49 of 2003) provides

legislative recognition of the separation between biological sex, gender identity, and sexual orientation. The act allows for application to the Department of Home Affairs for a change of sex description on birth records. The Civil Union Act (Act 17 of 2006) provides for same-sex marriages and provides individuals within civil unions the same rights as those under the Marriage Act. Each Department of Home Affairs office is required to have at least one marriage officer to perform same-sex marriages. However, the act does allow marriage officers to object on the grounds of conscience, religion, or belief to solemnizing a civil union if they write to the Minister of Home Affairs. In such cases, the department must deploy an alternate marriage officer to perform the service. The Criminal Law (Sexual Offences and Related Matters) Act (Act 32 of 2007) (Sexual Offences Act) sets uniform ages of consent, and it repealed previous legislation that limited protections against sexual offenses for homosexual individuals.

"Corrective rape," or the rape of lesbians to "correct" their sexuality, has been frequently reported, as have a number of other hate crimes against LGBTI people, including assault and murder. In 2011, following a number of violent rapes, the government established a national task team to investigate the attacks, to deal with violence against LGBTI persons, and to consider the development of legislation related to hate crimes. The section on marriages indicates the use of the Civil Unions Act for same-sex marriage. In 2016, after several years of sustained activism by LGBTI organizations, the Department of Justice published a draft bill to deal with the issues of hate crimes, including those against LGBTI persons.

Although the Alteration of Sex Description and Sex Status Act was passed in 2003, a number of challenges still arise when people wish to alter their sex description and register in the gender identity of their choice. Long delays at the Department of Home Affairs as well as a lack of clarity around the procedure for implementing the legislation continues to hinder meaningful access to the rights this piece of legislation provides.

Several nongovernmental organizations (NGOs) in South Africa work exclusively to promote LGBTI rights, including, but not limited to, the Triangle Project, Gender Dynamix, Out, and Gay and Lesbian Memory in Action (GALA).

Contraception

South Africa measures contraceptive use by the couple protection rate, examining the rate at which couples

(specifically women within couples) are protected against pregnancy by using contraception methods (including sterilizations). Women between the ages of 15 and 49 are considered for this rate. As at 2014, the couple protection rate was 46.8 percent. While this is low, it is important to note that the 2000 figure was 25.3 percent, and the proportion has grown each year (Health Systems Trust 2015). Interestingly, the rate is the lowest in Gauteng Province, which is the most urban and highly populated province with possibly the best access to health facilities.

POLITICS

Participation in the Executive and Parliament

National Government

Between 1994 and 2014, great strides have been made in increasing the representation of women in the National Assembly (NA, the upper house of Parliament) and National Council of Provinces (NCOP, the lower house of Parliament). As of the 2014 national elections, 41.9 percent of all National Assembly members are women, and 35.2 percent of all National Council of Provinces permanent delegates are women. In addition, the speaker of the National Assembly and the chairperson of the National Council of Provinces are both women. As of September 2015, South Africa was ranked eighth in the world in terms of gender representation at a parliamentary level (Inter-Parliamentary Union 2015).

At an executive government level, in 2009, 13 of 34 ministers were women, representing 38.2 percent. As of June 2014, 15 of 35 national ministers were women, representing 42.8 percent of all ministers and a marked increase from the 2009 figures. In 2009, 15 of the 32 deputy ministers were women (46.8%). In 2014, out of 37 deputy ministers, 17 were female, representing 45.9 percent, which is a slight decrease in women's representation at this level (Levendale 2015).

Provincial Government

South Africa has nine provinces, each with a premier (head of the executive branch), executive council (provincial cabinet), and provincial legislature. Members of the executive council (MECs) are appointed by the premier.

The representation of women as a member of the executive council and member level varies. As of 2014, only two of nine premiers were women, whereas the majority of speakers were female. On average, women make up more than 30 percent of all members of provincial legislatures.

Table 1 Women's Representation in Provincial Government

Eastern Cape Province			
Premier	Speaker	MECs	Members
M	F	6/10 are women (60 percent).	27/63 are women (42.7 percent).
Free State Province			
Premier	Speaker	MECs	Members
M	F	5/10 are women (50 percent).	13/30 are women (43.3 percent).
Gauteng Province			
Premier	Speaker	MECs	Members
M	F	4/10 are women (40 percent).	27/73 are women (36.9 percent).
KwaZulu-Natal Province			
Premier	Speaker	MECs	Members
M	F	5/10 are women (50 percent).	31/80 are women (38.7 percent).
Limpopo Province*			
Premier	Speaker	MECs	Members
M	F	5/9 are women (55.55 percent).	43/77 are women (55.8 percent).
Mpumalanga Province			
Premier	Speaker	MECs	Members
M	F	6/10 are women (60 percent).	13/30 are women (43.3 percent).
Northern Cape Province*			
Premier	Speaker	MECs	Members
F	M	3/10 are women (30 percent).	12/29 are women (41.4 percent).
North West Province			
Premier	Speaker	MECs	Members
M	F	5/10 are women (50 percent).	14/32 are women (43.7 percent).
Western Cape Province			
Premier	Speaker	MECs	Members
F	F	2/10 are women (20 percent).	15/42 are women (35.7 percent).

Table 1 provides information on the breakdown of women's representation at a provincial government level as of 2015 (Thorpe 2015).

The Western Cape performs most poorly with respect to gender equality at the level of MECs and members; Mpumalanga performs best in terms of women's representation with a range of 20–60 percent representation by women in the country's provinces.

Local Government

The Local Government Gender Policy Framework (2007) provides an implementation plan to ensure that gender equality is promoted at the local government level (South African Department of Provincial and Local Government 2007). South African local government administers cities and smaller regions (municipalities). There are three categories of municipality—metropolitan, district, and local—each with varying functionality and power. Metropolitan municipalities have exclusive municipal executive and legislative authority within their boundaries. Local municipalities share municipal executive and legislative authority with a district municipality in its area (SouthAfricaInfo.gov 2016).

In addition, municipalities are made up of wards, with councillors that seek to address community-level issues. Wards are geopolitical subdivisions of municipalities for electoral purposes. After 2011, there were 4,277 wards (SouthAfricaInfo.gov 2016).

In October 2015, 39.48 percent of local government representatives were female. The provinces with the best representation by women were Mpumalanga (51.95%) and North West (47.44%). The worst-performing province was the Western Cape, with only 37.08 percent of proportional representation candidates being female as of October 2015 (SouthAfricaInfo.gov 2016).

In 2000, 38 percent of proportional representation councillors were female, and by 2015, this had increased by 45.24 percent. At a ward council level, the increase in women's representation between 2000 and 2011 was more substantial. However, there is certainly room for improvement. In 2000, 17 percent of ward councillors were female. By 2011, 33.01 percent of ward councillors were female (Independent Electoral Council 2015). The local government elections that took place in 2016 will provide a critical look at how the government enforces some of the existing regional commitments in relation to gender parity.

At a ward level, the gender representation is far lower, with most provinces having less than 40 percent female representation. Of significance, KwaZulu-Natal had the

lowest representation, with only 18.12 percent of ward councillors being female as of October 2015. The best-performing province at a ward council level was Limpopo, with 40.70 percent of all ward councillors being female (Independent Electoral Council 2015).

Participation in the Judiciary

Transformation of the judiciary is essential to gain a balanced perspective on the application of the law. As of October 2015, transformation of the judiciary remained poor. Of the 10 constitutional court judges, only two were female. At the supreme court of appeals level, 6 of the 24 judges were female. At the labor court level, only 3 of 11 judges were female (Thorpe 2015).

At the high court level, 30.65 percent of judges were female (61 out of 199). Females made up 50 percent of the judges on the high court in only one province—the North West (Office of the Chief Justice of South Africa 2015).

South African magistrates' courts are lower courts that hear less serious criminal cases. As of February 2014, 1,649 magistrates were appointed in South Africa. Of these, only 677 were female, representing 40.45 percent (Whittle 2014).

Laws That Support Women or Further Gender Equality 1994–2015

The Constitution of the Republic of South Africa (Act 108 of 1996) enshrines the rights to equality and human dignity and prevents discrimination on the basis of gender. In addition, it prescribes that cultural rights may not conflict with the basic human rights enshrined in Chapter 2, and it established the Commission for Gender Equality.

The Labor Relations Act (Act 66 of 1995) is the main act that deals with sexual harassment in the workplace. It has a Code of Good Practice on Sexual Harassment that sets out the best ways to deal with complaints about sexual harassment.

The Commission on Gender Equality Act (Act 39 of 1996) formerly established the Commission for Gender Equality, which aims to promote gender equality and women's rights in South Africa.

The Choice on Termination of Pregnancy Act (Act 92 of 1996) is widely consulted and was one of the first legislative processes in the history of the South African Parliament to encompass wide-ranging public debate and public participation. The act repealed the restrictive and inaccessible provisions of the Abortion and Sterilization Act (Act 2 of 1975). It promotes reproductive rights and

extends freedom of choice by affording every woman the right to choose whether to have an early, safe, and legal termination of pregnancy according to her individual beliefs.

The Criminal Procedure Second Amendment Act (Act 85 of 1997) effected further amendments to the bail laws to ensure that persons who are accused of committing serious offences are not released and relates particularly to offenses where women and children are the victims.

The Employment Equity Act's (Act 55 of 1998) purpose is to achieve equity in the workplace by promoting equal opportunity and fair treatment in employment through the elimination of unfair discrimination. It also speaks to the implementation of affirmative action measures to redress the disadvantages in employment experienced by designated groups and to ensure their equitable representation in all occupational categories and levels in the workforce. Considering the large numbers of women who are in informal and casual employment, there is a need for better implementation and enforcement of the Employment Equity Act.

The Maintenance Act (Act 99 of 1998) deals with challenges with previous maintenance laws that often negatively affected women. It made provisions for maintenance to automatically be deducted from a person's salary and placed a duty on the state to trace people who failed to pay maintenance.

The Domestic Violence Act (Act 116 of 1998) is the primary legislation aimed at protecting women against violence in the home. It constitutes a substantial broadening of the limited scope of its predecessor, the Prevention of Family Violence Act of 1993. In its preamble, this act recognizes that domestic violence is a serious social evil and an obstacle to achieving gender equality.

The Recognition of Customary Marriages Act (Act 120 of 1998) went into effect in November 2000 and gives full legal recognition to customary marriages for the first time in the history of South Africa. Prior to the commencement of the act, customary marriages, (better known as customary unions) did not enjoy the same status as civil marriages concluded under the Marriage Act (Act 25 of 1961). This act prescribes that both partners must consent to a marriage and must be over the age of 18, and it governs practices such as *ukuthwala* (abducting girls and forcing them to marry). It also provides that women have equal rights to acquire and dispose of property in a customary marriage.

The Promotion of Equality and Prevention of Unfair Discrimination Act (Act 4 of 2000) (PEPUDA) aims to give effect to the constitutional requirements to equality and to

facilitate compliance with international law obligations. It prohibits discrimination by the state and by private organizations and individuals based on gender, sex, pregnancy, or marital status. This also relates to the inheritance of property.

The Traditional Leadership and Governance Framework Act (Act 41 of 2003) defines traditional communities as those that are subject to traditional leadership and that observe customary law. It requires that 40 percent of traditional councils be democratically elected, and a third of all members must be women.

The Civil Union Act (Act 17 of 2006) provides for females in same-sex relationships to marry and receive the same protections as spouses married under the Marriage Act of 1961.

The Criminal Law (Sexual Offences and Related Matters) Amendment Act (Act 32 of 2007) expanded the definition of rape and created a number of new crimes to cover the extent of violence against women in South Africa. The act removes the cautionary rule, where rape survivors' testimony is regarded with suspicion, and ensures that rape within marriage is classified as rape. In addition, the act specifies minimum sentences for categories of sexual violence, unless substantial and compelling circumstances exist.

The Reform of Customary Law of Succession and Regulation of Related Matters (Act 11 of 2009) did away with the rule of primogeniture, which prevented women from inheriting land. It also provides that spouses in polygynous marriages may inherit the equivalent of a child's share of their husband's estate.

The Protection from Harassment Act (Act 17 of 2011) protects women from harassment and provides for them to apply for protection orders in this regard. This act also applies to online harassment. It defines harassment to include direct and indirect conduct as well as sexual harassment.

The Prevention and Combating of Trafficking in Persons Act (Act 7 of 2013) introduces trafficking as an offense and sets up mechanisms to offer support to victims of trafficking. It also establishes harsh sentences for those involved in trafficking in persons.

In addition, the Women's Empowerment and Gender Equality Bill was introduced; however, this bill has not yet been signed into law because of criticisms from civil society groups (Mail and Guardian 2014).

Overarching Policy and Its Commitments to Women

South Africa has extensive policy supporting gender equality. It is important to note that key departments such as education and health administer their budget, policies, and programmes at a provincial level. Thus, the application of policies is based on provincial context. While the complete list is too extensive to include, it is worth noting South Africa's key policy document, the National Development Plan, and its relation to women.

The National Development Plan (NDP)

The National Development Plan (NDP), South Africa's primary policy document on development up to 2030, makes particular commitments in relation to women's rights and issues in a number of sections (National Planning Commission 2013). The section on "Women and the Plan" in the overview of the NDP summarizes the recommendations in relation to women, two of which specifically relate to the roles of women in government. The first is that the role of women as leaders in all sectors of society should actively be supported. The second is that social, cultural, religious, and educational barriers to women entering the job market should be addressed. Concrete measures should be put in place, and the results should be evaluated over time. Access to safe drinking water, electricity, and quality early childhood education, for example, could free women from doing unpaid work and help them seek jobs. The NDP thus recognizes that both legal and nonlegal barriers to women's involvement in government exist, and it commits South Africa to addressing them.

The Commission for Gender Equality (CGE)

The Commission for Gender Equality (CGE) is an institution supporting democracy that was established in Section 187 of the South African Constitution. The purpose of the CGE is to promote respect for gender equality and the protection, development, and attainment thereof. It undertakes research, public education, policy development, legislative initiatives, and monitoring and evaluation of South African commitments to gender equality.

The Department of Women

Between 2009 and 2014, championing women's rights within government was allocated to the Department of Women, Children and People with Disabilities. Both the

department and the minister of the department were criticized for inefficacy as well as spending their budget on nonessential activities (Thelwell 2014). Following the 2014 national election, the department was dismantled, and issues for children and people with disabilities were assigned to the Department of Social Development.

The new Department of Women falls under the ambit of the presidency and explicitly focuses on women's issues (South African Department of Women 2016). This department is consistently allocated the smallest budget of all the departments in the government, with half of its budget being made up of a financial transfer of funds to the CGE. Therefore, the department has limited ability to enact meaningful change in the lives of women. In addition, the department's focus is heavily on economic equality rather than addressing the broader issues of women's equality.

Issues

Violence against Women

Gender-based violence is a significant problem in South Africa. Between 2006 and 2013, more than 1 million contact crimes were committed against women, including murder, sexual offenses, and assault (South African Institute of Race Relations 2013). Sexual and domestic violence are extremely prevalent. An estimated three women per day are murdered by their intimate partners (Carte Blanche 2015). Hundreds of thousands of applications for protection from a partner are made each year under the terms of the Domestic Violence Act.

Women in Conflict with the Law

The most recent statistics on the number of women in the South African prison system indicate that women continue to represent a minority of prisoners, at 2.3 percent of the prison population. Female inmates were imprisoned for the crimes of murder, armed robbery, theft, child abuse, and fraud. As at March 2013, there were 3,029 sentenced female prisoners in South Africa, of which the majority were over the age of 21. In addition to these offenders, there are a further 1,089 remand detainees (ongoing trials) and other unsentenced inmates (state patients, deportation cases, persons awaiting extradition). This brings the total number of women in prison to 4,118. In some cases, this results in the overcrowding of facilities (Judicial Inspectorate for Correctional Services 2015).

In South Africa, Section 20(1) of the Correctional Services Act 111 of 1998 (as amended by the Correctional

Services Amendment Act 25 of 2008) determines that children may accompany their mothers in prison up to the age of two years, after which time they must be removed from the prison environment. As of March 2015, there were 81 babies living in correctional facilities (Judicial Inspectorate for Correctional Services 2015).

The Role of Women in the Abolition of Apartheid

Women in South Africa played an important role in challenging and protesting against the apartheid regime. The Federation of South African Women (FEDSAW) was one of the key mobilizers of women, uniting them against the apartheid regime and toward building a nonracist, non-sexist society. FEDSAW developed the Women's Charter, which called for the enfranchisement of men and women of all races and for equal rights for men and women. Many of these demands were incorporated into the Freedom Charter of the South African Congress Alliance.

One of the key moments celebrated in South African society is August 9, 1956, when an estimated 20,000 women marched to the Union Buildings in South Africa to protest the extension of pass laws to women. This day is now celebrated each year and known as National Women's Day. Women were organizers and active participants of the Defiance Campaign to exert pressure on the government to end apartheid.

Current Race Relations and How They Impact Women and Girls

Despite significant legislative and policy commitment to promote race relations in South Africa, in many instances, the intersection of class, race, and gender continues to make black women the most vulnerable members of South African society. In 2016, school protests arose around the stigmatization of black hair in schools, and in many instances, women were the leaders of the #feesmustfall campaign, which focused on equal access to tertiary education for all South Africans. The South African Constitution commits all South Africans to the values of nonracism and nonsexism, but the lived realities of many South African women do not necessarily correlate with those ideals. Black women continue to be the most likely to be poor and unemployed, and they struggle to access decent basic and other state services.

South Sudan

Overview of Country

South Sudan is Africa's newest nation, obtaining independence from the north of former Sudan on July 9, 2011. It is located in Northeast Africa, bordered by Sudan to the north, Ethiopia to the west, the Central African Republic to the east, and the Democratic Republic of Congo (DRC)

and Kenya to the south (SSNBS 2014). Juba, the capital, is the largest city in South Sudan, located in the state of Central Equatoria. The country is divided into 10 states, the other 9 being Western Equatoria, Eastern Equatoria, Lakes, Jonglei, Upper Nile, Unity, Warrap, Northern Bahr el Ghazal, and Western Bahr el Ghazal. The total population is 8.26 million, 52 percent male and 48 percent female. The average household has a family of seven. Largely due to years of civil war and ongoing conflict, 51 percent of the population is under the age of 18 (SSNBS 2014).

South Sudan is composed of expansive grasslands, swamps, and tropical rainforests and is traversed by the large White Nile River. This river provides one of the country's major sources of livelihood, fishery, especially for the Mandari tribe, who fish the river with nets and spears. With 83 percent of the population inhabiting rural locations, 78 percent of households depend on crop farming or animal husbandry for their primary source of income (SSNBS 2014).

History

Originally under joint British and Egyptian rule, the former country of Sudan established independence in 1956. Since then, the country has experienced two devastating civil wars. Much of the tension sparking the first war arose from disputes between the government, located in the capital of Khartoum in the north, and the people of the south. While under British-Egyptian rule, Egypt largely controlled the north of Sudan, while Great Britain ruled the south. As a result, the north became predominantly Muslim. After independence, the Sudanese government, based in the north, sought to expand national policies imposing an Islamic and Arabic identity, clashing with the southern people who predominantly followed indigenous traditional beliefs and practices (BBC 2014). This disagreement, combined with the capital's unfulfilled promise of creating a federal system of government after independence, sparked the first civil war between the south and the Sudanese government. The war endured until 1972, with the establishment of the Addis Ababa Peace Agreement that allowed the south some autonomy. These arrangements, however, were canceled by the Sudanese government prior to implementation, leading to the second civil war in 1983 (BBC 2014).

Led by the Sudan People's Liberation Movement (SPLM) and its army, the Sudan People's Liberation Army (SPLA), the south conducted 22 years of guerilla warfare

that wreaked havoc on Sudan's infrastructure, economy, and citizens. This war has been the longest-running civil war in African history and is responsible for the displacement of thousands. The second civil war ended in 2005, with a comprehensive peace agreement that guaranteed the south representation in a power-sharing national government as well as regional autonomy (BBC 2014).

Sources of Conflict

Despite South Sudan's newly established independence, major sources of conflict still exist between Sudan and South Sudan. The Abyei region, a small disputed territory that lies on the border between the north and south regions, covers 4,000 square miles and contains rich oil reserves, which has led to military invasions by the armies of both Sudan and South Sudan, displacing thousands of local residents. Its border location also lends to the clashing of many different ethnic groups, cultures, and languages that contribute to conflict. In drawing up the peace agreement in 2005, the governments of South Sudan and Sudan agreed to let the Abyei people decide for themselves which country they would belong to with a referendum that would redraw the borders (Zapat 2013). Scheduled to occur in 2011, along with South Sudan's independence, the referendum has been delayed several times due to disputes over the definition of "resident" and other voter-eligibility issues. The status of the Abyei region has yet to be established (BBC 2014).

Tensions exist within South Sudan, especially within the SPLM, over a perceived Dinka domination of the government. Fears arose in December 2013 that such tensions would erupt in a civil war, but it was subdued by peace talks. Many rebel armies opposing the SPLM government have emerged, including the South Sudan Liberation Army (BBC 2014).

Deadly cattle raids by rival ethnic groups within South Sudan continue to kill and displace hundreds of thousands of people, mostly women and children (BBC 2014). In 2012, one of the most violent raids occurred in the village of Pibor, in which 6,000 armed Lou Nuer warriors attacked residents of the Murle tribe, killing possibly thousands and abducting women and children. The village was razed to the ground, and tens of thousands were left homeless (Onyiega 2012).

Cattle raids by rivaling ethnic groups in Sudan have occurred for more than 100 years due to disagreements over access to water and land grazing. Cows represent

wealth, a source of food, dowry, and property—one cow can be worth hundreds of dollars (BBC 2012). While such raids used to be fought with sticks and spears, 23 years of civil war have caused an influx of small arms and other automatic weapons into the region that have made these attacks increasingly fatal since independence in 2011 (Onyiega 2012).

Education

A staggering 91 percent of South Sudan's population has no educational qualifications, and 71 percent of the population has never been to school. The adult literacy rate is 27 percent; however, this rate increases among young people to 44 percent for males aged 15–24 and 30 percent for females (SSNBS 2014), perhaps signifying a change in infrastructure and cultural values. Regardless, a significant gap exists between urban and rural literacy rates: 53 percent of the adult urban population is literate and only 22 percent of rural adult citizens.

Only 10 percent of women age 15 and older have completed secondary education, compared to 15 percent of men. Postsecondary completion rates shrink to 2 percent for women and 3 percent for men. Despite such low rates, enrollment in primary schools has been increasing by 20 percent each year since 2005. But with little improvement in infrastructure, this increase has led to increased pupil-teacher ratios and overcrowded classrooms (Oxfam Canada 2013, 5–6).

Health

Access to Health Care

The situation in South Sudan is dire. The conflicts of past decades have led to massive population displacement. Other factors contributing to poor health include lack of infrastructure, inadequate transportation, long distances to health facilities, and harmful social practices, such as female genital cutting and mutilation (FGC/FGM) and early child marriage (Koyok 2013). About 40 percent of girls marry while still children (Koyok 2013); the average age of first marriage is 19 years (SSNBS 2014). Organizations such as the United Nations Children's Fund are working with the South Sudanese government to improve maternal and child health (Koyok 2013).

Maternal Health

South Sudan has the highest maternal mortality rates in the world at 2,054 per 100,000 live births. Women have

a one in seven chance of dying due to pregnancy-related complications (UNDP 2014). This is a result of many factors, such as insufficient traditional birth attendants (TBAs). Most women give birth in their homes under the supervision of a TBA. TBAs and laboring women may have low or no access to health care facilities (Koyok 2013). There is only one qualified TBA per 30,000 people (UNDP 2014). About 90 percent of women give birth without the assistance of a skilled professional (Oxfam Canada 2013). Only 17 percent of women have more than 4 antenatal visits, and 17 percent of women are attended by a skilled birth attendant. The chance that women will die from maternal causes is 42 percent (WHO 2015).

Contraception Use

The usage of contraception is low among South Sudanese women. Among married women and those in a relationship, only 4 percent reported using any form of contraception in 2011 (Oxfam Canada 2013). Women have access to various forms of contraception, the most common method being lactational amenorrhea—an induced infertility caused by breastfeeding for the first six months after childbirth—and less common methods, such as condoms, diaphragms, and oral contraceptives. Abortion is a highly unpopular solution, due in part to the 2008 Penal Code Act's law that makes it punishable by imprisonment for up to seven years. However, if it is determined a woman proceeded with abortion to avoid shame, the term of imprisonment is lowered to a maximum of three years (Oxfam Canada 2013).

Diseases and Disorders

The health situation in South Sudan is deteriorating rapidly. Health services have been severely disrupted, and with massive population displacement leading to overcrowding and worsening environmental conditions, disease outbreaks are rampant. Reports of cholera, meningitis, hemorrhagic fever, measles, and malaria have been reported, and the World Health Organization (WHO) recommends more rapid response to contain infectious diseases (WHO 2017).

Employment

Economy

The unemployment rate for those aged 15 and older is 12 percent. Sixty-three percent of those 15 and older work in

agriculture, fishery, or animal husbandry. While this may seem optimistic, only 13 percent of this population is paid employees, the rest being unpaid laborers for families or self-sustenance (SSNBS 2014).

Poor infrastructure, especially access to clean water and sanitation, continues to be an issue that the new government will have to work toward resolving. Only 48 percent of households have access to improved drinking sources, such as mechanical boreholes, filtering stations, or hand pumps, and only 24 percent have sustainable access to a pit latrine or flush toilet. Nine percent of households own a mobile or landline phone, and 98 percent use solid fuels (SSNBS 2014).

Though South Sudan is one of Africa's least-developed nations, strong investments in infrastructure and utilities since the 2005 peace agreement have dramatically boosted its economy (BBC 2014). The current economy is highly dependent on oil and likely to benefit most from Sudan's oil wealth, as the country contains 75 percent of the former Sudan's oil reserves. However, the pipeline to the Red Sea and the refineries are located in present-day Sudan, which has caused ongoing border conflicts over revenue sharing that actually led to a halt in oil production in 2012; production has since resumed with an agreement to create a demilitarized zone on the shared border (BBC 2014).

At all levels of income, women earn lower wages than men. The main source of livelihood in households headed by women is crop farming, and only 10 percent of female-run homes earn wages or salaries (Oxfam Canada 2013, 6).

Family Life

There are many ethnic groups living within South Sudan. The second-largest group is the Nuer tribe, composed of 1.5 million South Sudanese. Men and women both hold important roles in family life and society, but they often differ in authority. These differences are reflected in various cultural traditions and values.

Cattle are central to daily life in South Sudan and often a family's most valuable possession. Many people take on a "cattle name"—the name of their favorite cow or oxen—and prefer to be greeted by this name. Cattle play pivotal roles in religion and traditional ceremonies, as well; a cow or oxen is sacrificed at every Nuer ritual. During the menstrual cycle, women are prohibited from drinking milk, eating food prepared in a kettle used for boiling milk, or visiting the cattle area; such actions are viewed as potentially harmful to the cattle (Gatkuoth 2010).

When a death occurs in Nuer culture, the mourning period for men is 5–6 months. Mourning for women lasts only 2–3 months (Gatkuoth 2010).

Traditionally, women are mainly responsible for managing the household and raising children, while men are expected to protect the tribe and care for the cattle. However, women are consulted on community affairs and contribute largely to mediating family and community disagreements and disputes (Gatkuoth 2010).

Gender roles have been influenced by new conditions imposed by two civil wars. With many men absent from family life because of fighting in war or being killed in such efforts, women began to take on male roles and responsibilities in addition to their original tasks, acquiring education, skills, and work experience. Though women continue to take leadership roles in society, sexist and patriarchal cultural norms still persist (Gatkuoth 2010).

Marriage

Marriage stands as the primary ambition for children and the ultimate life goal. A girl typically marries at age 17 or older (Gatkuoth 2010); however, there are cases of forced marriage among younger girls despite the Child Act of 2008 that criminalizes early marriage and the Transitional Constitution that prohibits forced marriage (Oxfam Canada 2013). Child marriage often inhibits or prevents education for girls and results in injuries, disabilities, or even death for the mother or child due to physical complications in childbirth, as the young girl's body is not yet developed adequately for childbirth. A girl is three times more likely to die from childbirth than to enter the eighth grade (UNDP 2014).

The marriage process includes a dowry, or payment, to the groom's family by the bride's family in the form of cows. This may consist of anywhere from 40 to 100 cattle, depending on the education level and physical beauty of the bride. Several rituals are also carried out prior to the final wedding ceremony, serving to foster a strong relationship between the two families. A marriage is considered incomplete until the birth of the couple's first child. Once the child is born, the mother is given her own hut as well as gifts, such as cooking sets, butter, and other provisions, to aid in caring for her husband and family. If a man impregnates a woman, he is expected to marry her and sometimes may suffer cattle raids by the girl's family (Gatkuoth 2010).

In the case of relational problems, a husband and wife may physically separate themselves by staying in relatives'

homes while males from either family meet to discuss the best solution for the problems. Usually, the couple will follow the advice of the families. Divorce may be granted to men or women for many reasons, such as drunkenness, unfriendly relationships with a mother-in-law, incompatibility, adultery, and impotence or barrenness. However, if a woman divorces her husband, child custody goes to the male (Gatkuoth 2010).

Politics

Government

The Republic of South Sudan is led by President Salva Kiir Mayardit, who is both head of the government and chief of state (CIA 2014). South Sudan has a bicameral national legislature, which consists of the National Legislative Assembly, with 332 seats, and the Council of States, with 50 seats. The three main political parties are the Sudan People's Liberation Movement (SPLM) (currently in power), the National Congress Party (NCP), and the Sudan People's Liberation Movement for Democratic Change (SPLM-DC). The judicial system is headed by a Supreme Court of seven justices, and there are subordinate courts at state, county, and customary levels (CIA 2014).

Participation in Government

South Sudan grants universal suffrage rights to both men and women over the age of 18. Compulsory and voluntary military service is now limited to citizens age 18 and older because of a reversed action plan signed with the United Nations in 2012 to demobilize the recruitment and training of child soldiers in the Sudan People's Liberation Army (SPLA) (CIA 2014).

Though the constitution gives equal rights to both men and women, equality is hardly enforced in rural settings where traditional practices still influence attitudes and behavior. The constitution states that 25 percent of political seats must be held by women across all levels of government (Meintjes 2012). However, women are still largely underrepresented in government. Overall, females hold 26.5 percent of the seats in the national parliament, represent 1 of 6 presidential advisers, 4 of 29 cabinet ministers, 4 of 27 undersecretaries, and 2 of 20 heads of commissions. In an effort to improve women's participation in politics and public services, South Sudan's Development Plan for 2011–2013 included

policies addressing harmful customs and practices that can inhibit women from fully taking part in capacity-building programs and the political process (Oxfam Canada 2013, 4–5).

Obstacles for women accessing the political sphere exist in the form of a lack of formal education, technical knowledge, experience, and language, as most positions require a fluency in Arabic and English. Also, because it is the males who traditionally control women's finances and own property, most women do not have the resources needed to afford election campaigns and nomination fees. Prevailing attitudes that leadership positions should be reserved for men pose a challenge for women in gaining votes and the trust of the public. Such attitudes also expose many women in political positions to verbal and sexual harassment in the workplace, further hindering their advancement in politics. Regardless, a passion to fix the nation's poor state of education and public health, both of which affect women daily, has pushed many women to become politically involved (Meintjes 2012).

Religious and Cultural Roles

Religion

South Sudan society is patriarchal, and the practice of polygyny (having multiple wives) is still common, though beginning to dissipate, likely due to globalization and development (Beswick 2001). The major ethnic groups, ranked by size, are the Dinka, Nuer, and Shilluk. While there are many ethnic groups inhabiting South Sudan, the majority follows traditional animistic religions, with a minority following Christian practices (BBC 2014). The Nuer people, the second-largest ethnic group in South Sudan, believe in the all-encompassing god *Kuoth* that is associated with the sky and spirits and present in all things living and nonliving. This god is viewed as the creator and origin of the ancestors (Gatkuoth 2010).

The Nuer have great reverence for the deceased. It is believed that through death, people become powerful and godlike spiritual beings. Ancestors are a significant aspect of religion, as they are considered active members of society that hold great authority and power to influence the well-being of the living or to change the course of events. They are considered an intermediate between the living and the gods. It is believed that the living communicate with their ancestors through possession and dreams. Worship of one's ancestors is necessary to avert illness, drought, famine, and other adversities (Gatkuoth 2010).

Issues

Violence against Women

Militarization and concurrent efforts to forge women's roles in the liberation struggle as mechanisms of reproduction to replenish the nation have increased violence against women (VAW). During the war, VAW was viewed as an inevitable occurrence; young male soldiers came to expect their sexual demands to be met as a form of payment for their military contribution. The nationalization of the wombs of women served to permit young men to assume rights over women's sexuality, creating an atmosphere conducive to VAW.

Such social attitudes have caused an increase in marital rape, as it is viewed as a husband's right to his wife's sexual services to produce offspring. Male sexual demands are seen as a woman's reproductive task that tradition requires her to fulfill (Jok 1999). In times of militarization, civilians living in areas of conflict often find themselves victimized by rival factions or the very military controlling that area. For example, in western Dinka, anti-SPLA troops raided several villages, killing the people, looting, and raping the women, including children and the elderly. Once they left, the controlling factions continued these atrocities on their own civilians to punish them for associating with the enemy (Jok 1999).

Traditional attitudes also encourage sexual violence against women by creating the image of the "good," or sexually pure, woman, and the "bad," or promiscuous, woman. Sexual violence is viewed as a discipline or given consequence to the latter. Many Dinka songs attempt to discourage sexual promiscuity of women by portraying rape and other sexual coercion as punishment for the "bad" women. They portray women as having an insatiable appetite for sex and deserving of such punishment because of their socially unacceptable sexual behavior. Soldiers have used this reasoning to justify committing acts of sexual violence against women (Jok 1999).

Domestic violence is the most commonly reported form of violence against women and is traditionally viewed as socially acceptable behavior. Nearly 80 percent of women in a study on the intermarital violence reported being battered several times throughout their married life for refusing sex. Militarization increases domestic violence by causing the displacement of women, which scatters people and changes social structures (especially gender roles), rendering women dependent on male leaders for protection and economic support. Such dependency can put

women at high risk for sexual exploitation and violence justified by women's reproductive roles (Jok 1999).

Militarization and displacement also create shifts in traditional gender roles, especially the provision of resources for the family. What was once the husband's duty falls to his wife when he can no longer provide due to joining the military or a loss of income from displacement. These shifts can cause tensions between genders, and men who feel their masculinity is being challenged may use violence against their wives and children to outlet their frustrations. Many women face the challenge of balancing their commitment to ensure reproductive continuity, their role as guardian of cultural identity, and protecting their own health and well-being (Jok 1999).

Since the 2005 Peace Agreement was signed, physical and sexual violence against women has increased due to the provision of small arms, increased alcohol consumption in the region, and the socialization of soldiers that encourages a hypermasculinity. However, South Sudan has no laws specifically regarding violence against women (Oxfam Canada 2013).

The SPLA has issued the death penalty for rape, and some soldiers have in fact been convicted of the crime; however, there remains no legal or cultural definition of rape. In the Penal Code Act of 2008, which criminalizes physical assault, such violence is classified as "gender offense." Rape is classified as a criminal offense, but the definition of rape excludes forced sex within a marriage (Oxfam Canada 2013). The lack of a clear definition of sexual violence paired with cultural notions of a woman's sexual role may serve to perpetuate violent acts against women, especially wives, in the region.

Law enforcement and justice systems have not effectively addressed cases of domestic abuse. Women have reported local police as unhelpful or uncooperative toward reported cases of domestic violence. Thus, most women and their families turn to a customary justice system instead of the police. Such systems are composed of tribal chiefs and clan heads that typically favor negotiation and restorative settlements versus punitive actions. Because of this custom, many cases of domestic violence go unpunished, and women are left vulnerable to repeated and increased violence (Oxfam Canada 2013).

Violence against women has a significant impact on a woman's emotional and physical health, specifically in the form of sexually transmitted diseases (STDs), reproductive health, unwanted pregnancy, adolescent fertility, maternal morbidity and mortality, and mental health.

Forming a National Female Identity

A women's issue that has arisen in the wake of Sudan's independence is the misrepresentation of women's contributions to the recent civil war by the government and popular media. Women are often portrayed as having fought as combatants alongside male soldiers, when in actuality, the majority of women contributed to the war effort as camp followers, members of women's associations, refugees, and even SPLA soldiers involved in noncombat support tasks (Pinaud 2013, 153).

Camp followers served troops as cooks, sources of support tasks, and sexual comforters. Oftentimes, these women joined as a means of survival for them and their families, or they were abducted in regions through which the troops had traveled. Sometimes, women of other nationalities were even uprooted from their communities and forced to marry soldiers. The marriages between soldiers and camp followers usually did not entail the traditional bridewealth typical to traditional marriage, and thus were not recognized as legitimate marriages. Because of this, these women were often viewed as unrespectable prostitutes and drunkards who left their homes and families to follow the armies. This absence of a bridewealth exchange became the most significant determinant of the status of camp followers (Pinaud 2013, 156–157).

A minority of women did in fact serve as combatants in the second civil war, in a female battalion called the Ketiba Barat. Most of them were under 20 years of age and belonged to the Dinka tribe, the largest and wealthiest ethnic group in South Sudan. Many were highly educated and went through a military training program at the University of Juba before joining the SPLA soldiers (Pinaud 2013, 154–155). As 90 percent of women in South Sudan were illiterate at the time, and the majority of them contributed as camp followers, this group of women is not representative of women involved in the war at that time. These women were married into the SPLA's ruling elite, to commanders and officers who paid bridewealths, creating a status division between Ketiba Barat women and camp-follower women (Pinaud 2013, 155).

Nevertheless, the SPLA advertises the Ketiba Barat women as symbols of South Sudanese women's efforts in the war, silencing the more realistic and somewhat controversial history of the camp followers. Denying this more negative side of the struggle for independence makes this group of women invisible. Valorizing the Ketiba Barat

members enhanced the social status of these women, giving them high-ranking positions in the government after independence, while most camp-followers did not even receive intended benefits from the government's Disarmament, Demobilization, and Reintegration Program, repaying them for their service. Such silencing has perpetuated social inequalities between South Sudanese women. This usurping of the national collective memory of women in the war serves to consolidate the power of the Dinka elite and contributes to the creation of a national identity of the "good" South Sudanese woman as the patriotic girl, wife, and mother, as opposed to single women and prostitutes represented by camp-followers (Pinaud 2013).

Many of these camp-followers are still held behind locked gates in the barracks, in forced servitude of the troops. Efforts by the United Nations to interview these women during the demilitarization period were refused by barrack guards claiming the women inside were only prostitutes (Pinaud 2013, 162). The hiding of these women from the public and international community inhibits the access of these women to political power, as acknowledged military contribution can justify the representation of women in political institutions, especially in a conservative and militarized society (Pinaud 2013, 153–154).

Human Trafficking

South Sudan continues to be placed on the United Nations' Tier 2 Watch List for not complying with the minimum standards for eliminating human trafficking. While the government has begun implementing a UN-backed campaign to eradicate the trafficking of child soldiers for military exploitation, other forms of trafficking, such as forced labor and sex work, have yet to be addressed (CIA 2014).

The country continues to be a major source and destination for men, women, and children sold into forced labor and sex work. South Sudanese women and girls from rural villages, especially those internally displaced by conflict, are often promised jobs in urban areas only to be forced into the sex trade. Currently, there are 708,900 internally displaced persons and 212,755 refugees living in South Sudan, mainly due to ethnic conflict, flooding, and drought (CIA 2014).

The government's strategy for handling situations of trafficking may contribute to its perpetuation. Individuals in prostitution are often arrested and sentenced to prison, including children trafficked for sex work, instead of delivering victims to organizations where they can find

treatment and care. There is currently no legal discrimination between voluntary and forced sex work (CIA 2014).

Land/Property Ownership

In 2011, the Southern Sudanese Land Commission developed a Land Policy encouraging government agencies and traditional authorities to not only recognize but also protect equal land and property rights for men and women. Included in their strategy is the development of programs to train, mentor, and recruit women for land administration roles and the establishment of rural paralegal organizations to provide legal advice and assistance to women regarding inheritance and land issues (Jok 1999).

Activism

Women's roles in society have been shifting to holding positions of greater political power. Strong desires to improve the poor state of public health and education have motivated many women to take a stronger role in politics, advocating for women's and girls' rights and challenging oppressive systems, such as unequal property ownership laws, wife inheritance, and violence against women (Meintjes 2012).

Women's grassroots activism was established long before South Sudan's independence. After the second civil war, women, exhausted from the adverse impacts of war on their health, social, political, and economic well-being, began to organize. Increasing discontent with their marginalization led to the formation of women's groups, including Women Empowerment for Peace Development, Numba Women for Peace, the National Democratic Alliance, and Sudanese Women in Nairobi, among others, that all promoted women's involvement in political rights and the peace process (Zaynab 2011). These women faced many obstacles to their efforts, including a lack of international recognition, limited mobility due to hostile travel conditions resulting from the political and military situation, lack of funding, and harassment. Eventually, the Royal Netherlands Embassy rendered support and facilitated the further organization of women's grassroots activism under the initiative the Sudanese Women Empowerment for Peace (SuWEP) (Zaynab 2011).

SuWEP formed nine committees, each representing different political parties or communities of Sudan, that received training in conflict resolution and mediation. These committees created a constituency of women's groups from the north and south, including the Sudanese

People Democratic Front (SPDF), SPLM United, Nonpartisan Women's Group, and the SWVP group in the north, and the Sudanese Women Civil Society Network for Peace, the National Democratic Alliance, the National Working Committee for Peace, and the Southern Women Group for Peace in the south. These member groups, composed of more than 1,000 directly involved Sudanese women, meet annually and are governed by democratically elected committees (Zaynab 2011).

Where SuWEP's original goal was to stop war by promoting negotiation to resolve conflict, it currently focuses its efforts toward empowering women to participate in peace-building and development processes and ensuring recognition and realization of women's rights (Zaynab 2011).

Other Grassroots Activism

Sudanese Women's Union (SWU)

Established in 1951, the Sudanese Women's Union (SWU) began by publishing a magazine called *The Women's Voice*, which spoke out against specific women's issues, such as facial scarification, polygyny, colonialism, genital mutilation, maternity benefits, unequal pay, and rights. The organization was banned from 1958 to 1964. In 1964, one of the SWU founders, Fatimah Ahmed Ibrahim, led the first women's demonstration in response, several hundred women strong, hastening the women's suffrage movement. In 1971, the organization was made official by the Sudanese government, but this meant the SWU could no longer challenge the government policies. The original organization, with 750,000 members in all provinces, was forced to work underground to implement projects on literacy, price controls, family welfare, savings unions, handicraft skills training, market development, and women's work co-ops. They currently work with both local and international women's organizations (Immigration and Refugee Board of Canada 2002).

Sudanese Women's Voice for Peace (SWVP)

The Sudanese Women's Voice for Peace (SWVP) was started in the mid-1980s by a group of refugee women from Sudan, and it has led community-building projects for Sudanese women refugees living in Uganda and Kenya to teach skills for reconciliation and trauma healing. Most refugees are currently returned to South Sudan, so SWVP mostly works with them in the villages. They help refugee women in rebuilding their lives after conflict by organizing efforts to bring them out of poverty. They collaborated

with Mercy beyond Borders, an international organization, to fund a women's tea café in Loa, South Sudan, and gave bicycles to women in 10 rural villages (Mercy beyond Borders 2013).

Sudan

Overview of Country

Sudan received independence from the joint British-Egyptian rule in 1956, yet the liberation was short-lived when General Ibrahim Abboud led a military coup against the civilian government elected in 1958 (BBC 2015; UNICEF 2009). General Abboud's coup is an example of the omnipresent alternative forms of government, authoritative and democratic, the Sudanese people have experienced. Sudan's periods of conflict, specifically 1955–1972 and 1983–2005, are the most extensive in Africa's postindependence history. Sudan was once the largest and most geographically diverse state in Africa. Southern rebels signed a comprehensive peace deal with the government to end the civil war in January 2005. Yet, another war ensued in the western region of Darfur, which has contributed to the country's inequities. In July 2011, people of South Sudan seceded. Regardless of the secession from Sudan, the territory continues to be plagued with issues of oil revenue and precise border demarcation. South Sudan's independence vastly affected the economy of Sudan

because more than 80 percent of Sudan's oil fields are in the southern part of the country. The situation between the countries intensified because of their inability to reach an agreement over transit fees from oil in South Sudan.

Sudan is the third-largest country on the African continent, with a total area of 1,882,000 square kilometers. Sudan's capital is Khartoum, and the country is bordered by seven states: Egypt, Eritrea, Ethiopia, South Sudan, Central African Republic, Chad, and Libya. The Nile River, the largest river in the world, passes through Sudan and South Sudan, while the Red Sea washes up on the eastern coast. The population in Sudan is approximately 38,800,000 people. Sudan is made up of individuals of Arab descent, particularly Fur, Beja, Nuba, and Fallata, as well as indigenous African groups. The official language is Arabic; however, Nubian, Ta Bedawie, and Fur are also spoken. The UN Development Programme (UNDP) estimates that more than 97 percent of the population of Sudan is Sunni Muslims. Christians are a small minority.

The UNDP ranked Sudan 167th out of 187 based on the Gender Inequality Index (GII) of 0.479 (UNDP 2015). The comprehensive economic growth in Sudan has not guaranteed equal human development improvements in the area. The continued differences between the urban and rural areas are apparent, contributing to an increasingly urban informal sector that accounts for more than 60 percent of Sudan's gross domestic product (GDP). In fact, investments and services are concentrated in and around Khartoum. This has encouraged a rural-to-urban migration that weakens the agricultural productivity and deepens poverty in both urban and rural areas (UNDP 2015).

More than 46 percent of the population lives in poverty in Sudan and experiences only 2.8 percent real GDP growth (UNDP 2015). Particularly as it pertains to Sudanese women, the role and positionality of women has been heavily influenced by the historical conflict and changes in the political system. Because of the internal and external conflict in the region, Sudanese women have been subjected to significant levels of violence from state and nonstate actors.

Girls and Teens

Education

Access to Basic Education

Traditionally, girls' education was one of the most underdeveloped systems in Sudan. It was frequently provided

by the khalwa, or religious school, where Koranic studies were the primary studies of girls. Schools did not prepare girls to be a part of the mainstream educational sphere, where their exclusion was even more prominent. Because of the work of Shaykh Babikr Badri, the Sudanese government established five elementary schools in 1920. While the establishment of the girls' elementary schools was a success, the further development of these educational institutions for Sudanese girls was slow. This was a result of the prejudice for boys to obtain a higher education, as girls' education was restricted to the elementary level until 1940. In 1940, the Omdurman Girls' Intermediate School was opened, and by 1955, 10 intermediate schools for girls were developed. In 1960, the Omdurman Girls' Secondary School for Girls was the only girls' secondary school operated by the government. The secondary school enrolled approximately 265 students. By 1960, 245 elementary schools for girls had been established; however, only 25 junior secondary or general school and two upper-secondary schools were established for girls. Although there were no vocational schools for girls, there was a Nurses' Training College with only 11 students. Nursing is not seen as a respectable occupation for Sudanese women.

It was in the 1960s and 1970s that girls' education made significant strides, and 1,086 primary schools, 268 intermediate schools, and 52 vocational schools for girls were established by 1970. Sudanese resources for girls' education claimed approximately one-third of the total resources available. Although the number of educational institutions increased in the north, in war-torn South Sudan, the number of schools remained the same.

The underdevelopment of girls' education is Sudan's tradition; parents of Sudanese girls tended to look upon girls' schools with suspicion and fear that schools would ruin the morals and ethics of their daughters. Preference is given to males because it is believed that males need to have the ability to advance themselves and their earning potential for their families. Sudanese females' values are measured by their adherence to domesticity to prepare for marriage and dowry that accompanied the ceremony. Sudanese females are thought to be a more valuable asset in the home until marriage, where they are primarily positioned in the kitchen.

The lack of access and development of schools has discouraged Sudanese parents from educating their daughters. Although there have been vast improvements for Sudanese girls, Sudanese educational institutions continue to face low enrollment rates among girls and high levels of

illiteracy. Nongovernmental organizations (NGOs) such as UNICEF have taken on the challenge of encouraging more children into the classrooms in Sudan. UNICEF has committed itself to enhancing the learning environment and quality of teaching for all levels of retention and matriculation. Its goal has been to support access and quality of education by “enabling 5.2 million children and young people to access quality basic education and other forms of learning; assisting 250,000 nomadic children to move from primary to secondary education; and ensuring 1 million children currently out of school have access to alternative forms of education” (UNICEF 2012).

To expand the access to education for Sudanese young people, specifically for Sudanese girls, UNICEF supports the expansion of school construction and the enhancement of school supplies. In addition, UNICEF promoted the “Alternative Learning Approaches,” which includes vocational training, adult education, literacy programs, teacher training, and social mobilization to promote the education of the entire Sudanese community. UNICEF supports child-friendly school environments where water and sanitation facilities are advanced beyond basic conditions. Efforts are underway to ensure that Sudanese educational facilities provide a comprehensive, child-focused education, with a strong focus on improving teaching and learning skills, and including issues such as HIV/AIDS awareness, life skills, literacy, and numeracy and psychological development (UNICEF 2012). Partnerships and government-sponsored initiatives assist the educational sustainment of Sudanese individuals, including, but not limited to, the establishment of the support for administrators to train teachers and manage financial and human resources (UNICEF 2012).

Higher Education and the Legacy of Secularization for Sudanese Girls

After the Euro-Egyptian army decisively defeated the Sudanese nationalist forces, a young Sudanese man named Babiker Badri traveled up the Nile and settled in the village of Rufu’a. It was in the village of Rufu’a that Badri opened a secular school, instead of a religious school, for boys. Badri was a very religious man and respected for his knowledge of the Koran. However, he had a radical notion that the girls should receive at least a minimum education so that they could be more compatible with their husbands. Badri’s radical idea to educate Sudanese girls equally to Sudanese boys was influenced by his large family, 13 girls and some sons. In 1904 and

1906, he requested British authorities’ permission to open an elementary school for girls, but the request was denied. His determination to open the school ultimately proved to be successful, and in 1907, Babiker began his secular school for girls in a mud hut with 9 of his own daughters as well as neighbors’ daughters. By the time Babiker Badri died in 1954, he was hailed as an educational pioneer in Sudan and given the honor of being addressed as Sheik Babiker.

It was from these humble means that the Badri family nurtured the private education in Sudan for over three generations. In 1966, Badri’s son Yusuf carried on his father’s work by establishing the Afhad University College for Women in Omdurman, across the Nile from Khartoum and next to the site where Badri had fought as a young Sudanese soldier. Afhad University began with only 23 students and 3 faculty members, including Yusuf. The university now has an enrollment of more than 5,000 students and occupies a new and modern campus. Professor Yusuf Bedri died in 1995 and was recognized as a pioneer in the education of Sudanese women. His son, Dr. Gasim Badri, has continued to expand Afhad’s curriculum and teaching innovations.

The Afhad University College for Women was granted full university status in Afhad in 1995. The university is the oldest and largest private university in Sudan and may be the only private women’s university in Africa. “Afhad,” in Arabic, means for “our grandchildren.” Currently, Badri’s grandchildren are among the leaders and faculty of the Afhad University for Women. Afhad University College for Women continues toward its objective of preparing women for more responsible roles, personally and professionally.

Teacher Education for Sudanese Girls

In 1898, there was an underwhelming amount of education, especially for girls. However, the education of boys was planned immediately and appropriately to fit the needs of the country’s male-dominated objectives. However, it was in 1920 that the growth of education in Sudan rose when Miss J. D. Evans was appointed by the government to organize a system of elementary schools and teacher training for half the country. By the year of 1939, in the northern and Muslim sections of Sudan, the education of girls was not universally accepted in the country. J. D. Evans was joined by her sister Dora Evans to provide a foundation for training schoolmistresses to engage in a more enlightened curriculum. While J. D. Evans’s goal of educating schoolmistresses beyond conforming to household duties faced

great objection, parents began to realize that a girl's salary was a useful addition to the family income. Although parents struggled with the idea of young women earning money, teaching became a respectable occupation for them.

Effects of Childhood Marriage

Compulsory childhood marriage is a significant issue in Sudan, although information about its prevalence is not documented. National childhood legislation introduced in 2010 does not include protection against early or forced marriage in Sudan. A large household survey, including data from Sudan and South Sudan, conducted by the government of South Sudan in 2006, found that 36 percent of women in Sudan were married before the age of 18. The survey also found that 12 percent of women were married before the age of 15. Early marriage is more prevalent in rural areas. Sudanese females are more often to experience domestic violence and less likely to take action against their mates in a child marriage. Sudanese child brides are more likely to believe their partners are justified in beating them.

Health

Access to Health Care

Sudanese hospitals, both public and private, are unequipped to serve its population. The hospitals have scarce resources. Their health care professionals are exhausted and continue to sacrifice their own time and resources. Sudan's weak public health care infrastructure is a significant consequence of the economic policies of President Omar al-Bashir's National Congress Party (NCP). His attempt to privatize the health care system has largely failed. Consequently, millions of Sudanese citizens have been left without access to health care and insurance, especially without a large NGO presence. As Malik (2014) discovered, doctors have been known to spend their last financial resources to buy their patients lifesaving medications. A person in a Sudanese hospital will always find a doctor that is stretched beyond his limits. Public and private hospitals face problems of scarce resources and health care professionals. As the gaps between the rich and poor proceed to widen, patients are burdened with the cost of medications, injections, and basic scans. Patients "carry their subscriptions scribbled by the specialists who charged them the last of their money, and hobble from car to bystander to pedestrian, asking for help in paying

for their medicine and scans" (Malik 2014). It is common for parents to be unable to pay for their children's medical bills. Even families with the most comprehensive insurance plans have limited means and must pay out-of-pocket costs for prescriptions.

The overwhelming reelection victory of President Bashir reinforced that Sudanese citizens cannot bring change through their vote. In an attempt to combat some of the financial pressures, some doctors have resorted to the use of social media. Doctors promote funding or the transportation of patients to hospitals through social media, specifically on WhatsApp groups and Facebook pages. Sharià-al-Hawadith, a three-year-old initiative, aims to meet Sudan's child health insurance gap by gaining support for medical care online. Sharià-al-Hawadith is named after the street where it was founded, which translates into "Accidents Lane," and it is the largest organization in the new wave of Internet-based initiatives that addresses the inaccessibility to Sudan's health care infrastructure. Doctors treating children can call volunteers that are available around the clock and fulfill requests for medicine that children's parents cannot afford. Volunteers post requests on Facebook, and individuals can send their donations by phone or directly to curbside teams found in all of Sudan's 18 states. Sharià-al-Hawadith's initiative sustains itself by not labeling itself as an NGO and existing only online. The initiative is rooted in traditional Sudanese self-help groups that assist communities in their times of need. While the initiative faces critiques from the government about having a communist agenda, a member of Sharià-al-Hawadith states the authorities will not close in on them "because we are providing and helping a huge number of patients" (Pantinkin 2015).

Maternal Health

Sudan has 10.6 million women of reproductive age who give birth to 5–6 children each (UNFPA 2016). Contraceptive use is low; only 9 percent of women access some form, compared with 46 percent in the larger region, and contraceptive use is lowest in rural areas. The most commonly used form is oral contraception (70%) (WHO 2016). Condoms are rarely used for family planning, and UNFPA reports that supplies are often out. Only 20 percent of births are attended by a skilled birth professional (UNFPA 2016). In rural areas, it is common for not even basic midwifery services to be available. One in 32 Sudanese women dies due to pregnancy- or birth-related causes. More than

60 percent of these deaths were easily prevented. The complications could have been easily treated if the women had had access to skilled birth attendants or fully staffed hospitals with medical resources, including medications, blood supplies, and surgical equipment. UNFPA is assisting with training for village midwives and technicians in underserved rural areas. Though 75 percent of pregnant women have at least one antenatal appointment, only 47 percent receive the recommended four visits that are directly connected with good birth outcomes for mother and baby (UNFPA 2016). Mortality rates for children under five years old have dropped from 128 per 100,000 in 1990 to 77 per 100,000 in 2013.

The civil war and continued violence in Sudan have led to reduced access to education as well as health services, which contributes to these poor outcomes. A woman who is literate and has had more education is more likely to use contraception and to seek out information that improves her health and the health of her family. She is also more likely to be older when getting married and having her first baby. Ten percent of girls 12–14 years old and 38 percent of those 15–19 years old are married. “Of these married girls, 1 percent aged 12 to 14 years and 16 percent ages 15 to 19 years have begun childbearing, and yet 95 percent of them have no access to family planning” (UNFPA 2016).

Diseases and Disorders

As in any country with a recent history of civil war and violence, Sudan is at greater risk for treatable diseases due to the lack of health care infrastructure and the tenuous education system that leads to a shortage of health care and medical professionals as well as an underinformed population. Malaria remains a critical issue for the country and, along with communicable, perinatal, and nutritional conditions, contributes to 53 percent of deaths. Death due to injuries is at 13 percent, and noncommunicable diseases such as cardiovascular, cancer, chronic respiratory diseases, and diabetes are the most common (WHO 2016).

Female Genital Cutting

Female genital cutting (FGC), sometimes called female genital mutilation (FGM), is a practice that originated in the Pharaonic times in Egypt and Sudan. It refers to “all procedures involving partial or total removal of the female external genitalia or other injury to the female genital organs for non-medical reasons” (UNICEF 2016). There are

three forms of practice in FGC, and a significant majority of Sudanese women have been subjected to one of the most severe forms. Although the British administration created legislation against FGC in 1946, it affects more than 88 percent of women in Sudan, or 9 out of 10 Sudanese women aged 15–49 (Abbas 2013; Simonsen 2013). The majority of the women have undergone a procedure known as infibulation, or pharaonic circumcision, in which all or part of the inner and outer labia and usually the clitoris are removed. The operation is usually performed by a traditional birth attendant. The procedure has no benefits but significant detriments. Fatema, a Sudanese woman, states, “It creates so many problems. It affects a woman during her period. It causes infections. It is a problem early in the marriage, and during pregnancy and delivery” (Simonsen 2013). Kassala, a town in Sudan, has the third-highest prevalence of girls and women who have been cut, approximately 78.9 percent (Simonsen 2013). However, there has been a shift in attitudes toward discontinuing the practice of FGC.

In 2007, UN organizations, civil society groups, and other institutional agents came together to create a campaign to end FGM in Sudan. A campaign named Saleema, a word that translates “to complete, to signify that a girl should remain the way that she was born,” was created (Abbas 2013). The campaign has increased its fight against FGC and FGM and utilizes extensive media outreach to foster discussion around the once taboo issue in Sudan. Saleema’s message encourages parents to allow their girls to remain “whole,” “intact,” and in her “God-given condition” (Simonsen 2013; Abbas 2013). Celebrities and other respected individuals are plastered across billboards with the saying, “Let every girl born Saleema grow Saleema” (Abbas 2013).

While the name Saleema is being shared with the citizens, individuals such as Sarah Osman, believe the message of the detriments of FGC is not getting across. With a greater aim to promote discussion about FGM, messages of Saleema are disseminated through the radio and television as well as in health facilities, such as the Saudi Hospital in Kassala, that educate pregnant women on the benefits of not cutting. The ability to counsel and discuss with Sudanese females the benefits of not cutting their children helps dismantle the attitudes of “women, not men, who are most reluctant to abandon the practice of cutting girls” (Simonsen 2013). Aziza, a 30-year-old mother of three girls and three boys states, “None of my three daughters have been cut, I myself am convinced that cutting is bad—I have suffered its consequences when giving birth. But my mother

and grandmother are not supporting my decision” (Simonsen 2013). However, in an attempt to decrease family conflict, Aziza suggests that her daughters be cut in a “less intrusive procedure” (Simonsen 2013).

Although Saleema is a nationwide initiative that is supported by state institutions, FGC is not criminalized by law in Sudan. In 2010, activists and the international community were surprised to discover that an article to ban FGM was taken off from the much-awaited Child Law. A bill that prevents FGC and requires a maximum 10-year imprisonment of the parents if the daughter dies has been reviewed by the parliament since 2007; yet, there have been no improvements in the practice of FGC. Civil rights groups such as Babiker Badri Scientific Association for Women’s Studies, based at Ahfad University for Women in Omdurman (the twin city of the capital Khartoum), work to combat FGC by fostering dialogue on the negative consequences of the practice. Mahasin Ali, the coordinator of Babiker Badri Scientific Association, stated, “We used to talk about the harmful sides of FGM and for the longest time, no real change was observed in attitudes and in practice. Then we changed our approach and began selling the positive aspects, what is positive about not carrying out FGM on a girl” (Abbas 2013). The discussion about carrying out the practice of FGM across the different communities in Sudan assisted the organization in developing a more inclusive approach and campaign. The Babiker Badri Scientific Association is having group discussions about the negative consequences of FGC with women, men in sports, and cultural clubs in Sudanese communities. These discussion-oriented approaches have aided in redeveloping the Saleema campaign, which has broadened its efforts in reaching more people and being more transparent in its approach.

Abdelraouf Elsiddig Ahmed, a UNICEF child protection specialist notes, “If we compare the 2006 and 2010 Sudanese Household Surveys, we see a notable decrease in the practice of cutting. For instance, in the 5 to 9 age bracket, 34.5 percent had been cut in 2010, compared to 41 percent in 2006. In the next Household Survey, we expect to see a further decrease. That is when we will see the impact of the Saleema program” (Simonsen 2013).

Family Life

Marriage and Sudanese Women Rights

The 1991 Personal Status Law for Muslims governs the marriage between men and women. Currently, all northern-

based political parties, as well as the Sudanese Communist Party, advocate for their interpretation of the family law and sharia law (laws based on Islamic interpretations of the Koran). The political parties are in opposition to the Muslim Personal Status Act of 1991 that allows Sudanese males to marry four wives, but he has to treat them all fairly. The minimum age for marriage is defined as both the Sudanese male and female having reached puberty. Both parties need to give consent to marry; however, the Sudanese female must obtain permission from a male guardian, or wali, to validate the marriage. The male is responsible for providing a dowry, which is the property of the wife, and the man is the financial provider for the family. A husband has the capability of denying that his wife can work outside of the home, even if he fails to provide sufficient financial resources.

Women’s ability to initiate divorce varies according to the variety of laws in Sudan. While men have the capability of divorcing women unilaterally just by saying, “I divorce you,” women only have the right to file for divorce in particular circumstances. These situations include the following: “if the husband fails to fulfill his financial obligation to support her; if her husband has more than one wife and she can prove that her husband does not treat all his wives equally; if the husband has a defect she did not know about before marriage; if the husband suffers from an incurable mental illness; if the husband is impotent; if he behaves cruelly; if he is abroad for more than one year; and if the husband is sentenced to prison for more than two years” (Tonnessen 2007; SIGI 2016). Although Sudanese women experience these rigid divorce policies, there have been two improvements: a woman may obtain a divorce if her husband had a defect she was not aware of before the marriage and, after divorce, the wife is not required to return to the principle of the “house of obedience,” or maintain occupancy in the same household, as the husband.

Parental authority is granted solely to the fathers, and men have the legal status as the head of the family. A divorce under Islamic and Coptic family law specifies that the mother has custody of a female child until she is nine years old and male child until he is seven years old. Once the children reach these ages, the courts can order custody arrangements that would be more sufficient for the child, but Sudanese men automatically obtain custody if the woman remarries. “Islamic family law women have inheritance rights. However, under the rule of *tāʿseeb*, or inheritance by filiation, the share for women and daughters is generally half of that to which men are entitled”

(Tonnessen 2007; SIGI 2016). Women do not have any inheritance rights under the customary law. In addition, under the customary law, widows are mandated to marry another man in the husband's family. While Christian and Muslim women share the same parental authority rights, Christian women and men have equal rights in regard to inheritance (SIGI 2016).

Politics

Economics and Politics

Sudan has an abundance of rich natural resources, such as natural gas, gold, silver, zinc, iron, uranium, copper, cobalt, aluminum, and others. While agriculture has served as the primary source of income and employment for the Sudanese people, oil production drove the majority of Sudan's post-2000 economic growth. In 2012, the industrial and service sectors decreased because of the oil loss, and the agriculture sector saw positive growth. The Sudanese government attempts to diversify its cash crops; yet, limitations in major agricultural exports, transportation, and irrigation deter Sudan from obtaining a dynamic agricultural economy. To combat these issues, the government engages in strategic relationships with domestic and global actors to increase agricultural exports. These relationships have been essential to help with the lack of equivalent human developments and poverty reduction initiatives.

Sudanese women are given at least 25 percent participation in Parliament based on the 2008 Electoral Law, and women currently make up 28 percent of the Parliament seats. However, while gender equality may be central, women continue to "shoulder the burden of displacement and poverty associate with conflict, and in rural areas, less than a third of women have had access to any form of education" (SIGI 2016).

Under Article 32 of Sudan's Interim Constitution, women and men had equal entitlement to all civic, political, economic, social, and cultural rights. Article 32 also specified the state "shall promote woman rights through affirmative action [and] . . . shall combat harmful customs and traditions which undermine the dignity and status of women" (Government of Sudan 2005, 14). According to Article 15 of the Sudanese Interim Constitution, "The state shall emancipate women from injustice, promote gender equality, and encourage the role of women in family and public life" (8). However, after the Sudanese president Omar Hassan al-Bashir announced South Sudan's

secession, he introduced a new constitution that would be based on sharia law. Consequently, women are subjected to negative social and cultural perceptions that fuel discrimination and harassment.

According to a new report by the Human Rights Watch (HRW), there has been abuse of and repression against female activists and human rights supporters in Sudan (HRW 2017). Specifically, Sudanese women are subjected to harsh policies that affect what they wear, where they can work, and uses of infrastructure. The HRW uncovered several cases of alleged rape and sexual violence by authorities. One activist said men surrounded her and then beat and raped her while she was distributing pamphlets. These tactics, as well as attacking women's reputations to silence them, occur while authorities repress civil society groups, especially those that are dedicated to women's rights.

LGBT rights are not protected in Sudan. Same-sex relationships are illegal and punishable by death; a man's first offense is punishable by lashing. Rooted in conservative and religious ideas, the Sudanese rarely talk about sexual identity, and the first organization to work on LGBT rights, Freedom Sudan, was formed in 2006. A second organization, Bedayaa, was formed in 2010 to serve Sudanese and Egyptian people.

ISSUES

Resistance and Violence against Sudanese Women

Women and girls in Sudan are constantly faced with detriments imposed by the public order regime that prevents their freedom and ability to make personal choices. Sudanese women are confronted with initiatives and laws that impose corporal punishment for what is deemed immoral behavior. Specifically, Sudan's Criminal Penal Code of 1991, Article 152, or the Society of Safety Code, calls for the punishment of

Whoever does in a public place an indecent act or an act contrary to public morals or wears an obscene outfit or contrary to public morals or causing an annoyance to public feelings shall be punished with flogging which may not exceed forty lashes or with fine or both. The act shall be contrary to public morals if it is regarding as such according to the standard of the person's religion or the custom of the country where the act takes place. (End Corporal Punishment 2017)

In 2009, the Sudanese government faced international outrage following the arrest of UN officer Lubna Hussain and 13 other Christian women who were threatened with 40 lashes for wearing pants. In 2012, 70 percent of the 43,000 cases sent to the public order courts involved women. Amal Habbani, a civil and human rights advocate with the group No to Women's Oppression Initiative, argues there are 40,000–50,000 women arrested and flogged every year because of their clothing (Mutiga 2014). Eight out of every 10 women charged were drawn from vulnerable groups, including those internally displaced by civil war (Mutiga 2014). Meriam Ibrahim was sentenced to death for converting to Christianity from Islam, but Ibrahim was eventually allowed to leave Sudan. In 2013, civil engineer Amira Osman Hamed faced a public flogging after her arrest by 10 police officers for “indecent dressing” because her hair was not covered (Mutiga 2014). After a global outcry, she was not flogged.

President Omar al-Bashir enacted his tolerance toward Christians and gender equity through language and implementation of the sharia (Islamic law) for over 25 years. He infamously stated in a 2010 speech, “We don't want to hear anything about diversity—Sudan is an Islamic and Arabic country” (Salih 2015). While President al-Bashir has been charged with war crimes in Darfur by the International Criminal Court, he has maintained power and control through his relationship with the ruling National Congress Party and security forces.

Women are held to a different standard than men, and Christians in particular are targeted by the state. Fardos Al Toum, a 19-year-old Sudanese Christian woman, was arrested for indecency with 11 other women in June 2015, in front of a church in Khartoum, by the “morality police.” The women, between the ages of 17 and 23, were originally from the Nuba Mountains region on the border with South Sudan. In 2015, Saadia Rajab, 22 years old, was charged with adultery and sentenced to death by stoning (Ahmed 2015). Article 146 of Sudan's Criminal Act of 1991 specifies that death by stoning is the punishment for adultery by a married person. Based on Saadia's plea of not guilty and withdrawal of the complaint by her husband, the charges were dropped. Human rights groups state the continued overpolicing and overgovernance of Sudanese Christian females is demonstrative of the government's intolerance to its minority female and Christian populations. The group of women gained a significant amount of support from international organizations such as Amnesty International and the United Nations, who called for the charges

against the women to be dropped: “The public order law is imposed in a way which is hugely discriminatory and totally inappropriate and violates women's rights” (Salih 2015). While women's rights activists face tremendous consequences for their determination, Sudanese women and organizations such as Amnesty International and No to Oppressing Women Initiative (NOW) aim to dismantle these discriminatory policies.

Amira Osman Hamed and other women's rights activists are hoping to increase the international support to overturn Sudan's public order laws. Rights activists state, “These laws are arbitrarily enforced and used as cover to oppress vulnerable groups, particularly women, who face long spells in jail for infractions such as dancing with men or operating a hair salon before the age of thirty-five” (Mutiga 2014). These laws have a “women-are-the-devil” mentality, and therefore women's daily life activities need to be policed and controlled. A 2014 report by London-based Equal Rights Trust and in partnership with the Sudanese Organization for Research and Development, *In Search of Confluence—Addressing Discrimination and Inequality in Sudan*, accuses the government of mass rights violations embedded in the law (Mutiga 2014). The report relied on oral testimonies from more than 260 people and includes an analysis of Sudan's laws. One of the most interesting findings, according to Equal Rights Trust executive director Dimitrina Petrova, was the number of government critics and journalists imprisoned. Fifty-five out of 60 civil society activists had been arrested in the past three years because of this work (Mutiga 2014). The report addresses issues across a range of intersections, such as race, ethnicity, religion, political opinion, health, and sexual identity. It also included the first testimony from Sudan's gay community, which the report notes is highly oppressed. Women continue to face a disproportionate burden of abuses in the highly male-dominated society of Sudan.

Syria

Overview of Country

Syria is located in the western Mediterranean between Turkey, Lebanon, Israel, and Iraq. It is roughly 84,172 square miles (185,180 sq. km), with 83 miles of coastline. From the mountainous border it shares with Lebanon, Syria's topography descends to a fertile valley that runs from south to north, and then east along the Euphrates River. Most of Syria's geography is high desert, with mountainous areas in the north. In 2014, the UN Development Programme (UNDP) ranked Syria 119th out of 187 nations based on the Gender Inequality Index (GII, 0.533) (UNDP 2014).

Syria's population is approximately 23 million, about half of whom live in the major cities of Aleppo (3 million), Damascus (2.5 million), Homs (1.4 million), and Hamah (1 million). For several decades, Syria was experiencing rapid population growth through persistently high birth rates. Between 1970 and 2010, its population tripled from 6 million to 22 million. Nearly a third of the population is under the age of 15, creating greater demands on Syria's educational system and opportunities for employment. Since the beginning of the civil war in 2011, Syria's overall population has experienced negative growth through the exodus of refugees into neighboring Jordan, Lebanon, Turkey, and Iraq. The United Nations estimates that nearly one-third of the population will be refugees by the end of 2017; more than 4.5 million having fled to neighboring countries, and 6.5 million live as displaced citizens within Syria's own borders (UNHCR 2016).

Religion

Syria's religious and cultural groups trace their beginnings back to the Roman Empire. Jews and Christians as well as Greeks, Romans, and other religious and ethnic groups lived in the cities of Damascus, Homs, and Aleppo from the first century CE. When Muslim armies conquered the area in the seventh century, many of these communities converted to Islam, and much of Syria was absorbed into an expanding Umayyad empire whose primary language was Arabic. Today, Syria is a multiethnic, multireligious country with diverse religious and cultural groups. The state guarantees freedom of religion (albeit with restrictions on interfaith marriage and religious conversion) and allows workers leave for religious holidays. State offices are

closed on Friday, the Muslim day of rest, and Christians are provided time off for Sunday worship and other holidays.

The majority of Syrians are Sunni Muslims (74%). Approximately 10 percent identify with Shia Islam, including offshoots of Shiism many conservative Sunni's consider to be different enough that they are no longer within Islam, including Ismailis and Alawis (the religion of the current president). Nine percent of Syrians are Christian (mostly from Syriac, or Eastern Christianity, as well as Armenian Christians and smaller minorities of Roman Catholics and Protestants). Three percent of the population is Druze (an offshoot of Islam), and a very small number of Jewish residents continue to live in Damascus and Aleppo. The population of religious minorities has rapidly declined since the civil war devastated the city of Homs (where the Christian population has dwindled from 160,000 to approximately 1,000 in the past three years) and the Yezidi communities in the northeast and in Aleppo.

Different sects see the relationship between religion and government differently. For example, Sunnis believe God can be known through regular worship and indirectly through ritual specialists and the Koran and that law should be shaped by religious principles. Alawis, on the other hand, have more of a sense that God is known mysteriously but directly through religious authorities (or "gates" that are available in every age) and that religion and politics are complementary but separate spheres of life.

Ethnicity

The majority of Syria's population is Arabs (90%) with smaller groups of Armenians, Kurds, Turkmen, Circassians, and Chechens. Ethnicity and religion often, but do not always, overlap, so while most Muslims are also ethnically Arab, Christians may be Arab, Armenian, or Palestinian ethnically. Ethnic and religious groups tend to live in separate urban neighborhoods or villages, exacerbating cultural and economic divisions across groups. Children of women married to non-Syrians take on the nationality of the father.

Education

Hafiz al-Asad (president between 1971 and 2000) and his son Bashar al-Asad (president since his father's death in 2000) have had tremendous influence over Syria's educational system. The elder Asad credited his rise to power in part to the education he received in village schools

established by the French between World War I and World War II. He was a great advocate of education and invested in elementary and secondary schools across the country. His son, Bashar, was an active promoter of the Syrian Computer Society prior to becoming president and has gone on to create the first private universities and programs in online education (both of which remain very expensive and relatively small in terms of enrollments).

Education is considered the right and responsibility of all Syrians, and primary school is mandatory until age twelve. The vast majority of girls attend public school, although elite families are likely to send their children to private schools or foreign schools for their education. Only 4 percent of all students are enrolled in private schools. Education is free; however, families must purchase supplies and school uniforms in the lower grades and pay for books and supplies at public universities. Under Hafiz and Bashar al-Asad, girls as well as boys have been encouraged to attend military-style summer camps beginning at age nine. Attendance is not mandatory; however, participation in the camps and membership in the youth Baath Party student association provides bonus points on mandatory university entrance exams. This baccalaureate exam is taken at the end of a student's final year of high school—the score of which determines both the university a student may attend and the topic they may study. Those who score very high on the baccalaureate exam may study medicine, engineering, or pharmacy, while those whose scores are lower may only be admitted to programs of study in the social sciences or English language and literature.

Compared to other Arab states, Syria's comparatively higher investments in education have produced higher enrollments, lower illiteracy, and greater access to a range of fields for women. Since the mid-1970s, literacy among women has risen from 50 percent to 78 percent (well above the regional 51% average in other states). Among younger women (ages 15–25) literacy is even higher, around 93 percent. Primary school enrollment is mandatory and stands at about 98 percent for girls, compared to a regional average of 78 percent. Women are just under half of all university students at the state's flagship university in Damascus (with most women concentrated in teaching (75%); literature and humanities (64.7%); pharmacy (61%); architecture (52%); and sciences (41%) (CBS 2014). Young women may also enroll in vocational schools for training in education, computers, foreign language, sewing, or business.

Despite these gains in basic education, dropout rates remain a significant problem, especially for girls. Nearly 30 percent of all girls leave school with less than a ninth grade education, and another 30 percent never go beyond a high school diploma. Most leave to help care for siblings at home or go to work (either out of economic need or because they fail the exams necessary to advance to the next level). Enrollments are lower in rural areas than in urban areas as children leave school to work in agriculture or family businesses.

Recreation

Athletic clubs in urban areas have been popular venues for girls' athletics since the 1950s. Participation in coeducational sports is limited, particularly as girls reach adolescence and families become more concerned about public appearance and interactions with nonrelated men. Syria's General Union of Sports promotes sports in rural areas, and schools provide training and recreational activities for girls and boys in combined classes in younger grades and separate classes in school facilities or in sport clubs nearby for students in high school and university. The General Sport Federation promotes recreational activities through more than 300 sports clubs throughout the country (Karfoul 2010); however, women make up less than 10 percent of club membership. The hijab, or headscarf, is not required for Muslim girls and women athletes; however, the practice is increasingly popular as a sign of personal and religious identity. Gymnastics, swimming, basketball, track, and, more recently, soccer are popular recreational sports.

While organized sports are increasingly popular, particularly within urban areas, it is more common for women and girls to participate in informal recreational activities with family and friends. Hiking, excursions to the mountains and seaside, and picnicking are inexpensive social activities that allow girls from lower incomes opportunities for physical activity and socializing.

Family Roles

Syria remains quite traditional in terms of domestic roles. Girls in both urban and rural areas are often involved in helping their mothers at home, caring for younger siblings and, in middle-income households, doing chores. Village girls may be given responsibility for caring for younger siblings, working in the fields, or helping as vendors in

family businesses. As they approach later adolescence, girls may complain about a lack of things to do as their outside activities become more limited because of parents' concerns about preserving their daughters' reputations. It is not uncommon for girls to begin to feel they are simply sitting and waiting to marry in the years between finishing high school and becoming engaged. Marriage is assumed to be the role girls (and boys) will inevitably take on as they enter adulthood. Girls who do not eventually marry remain with their parents or in a brother's or other relative's home throughout adulthood. It is very unusual for Syrians to live apart from family, especially in the case of women and girls. In old age, widowed women also commonly live with relatives, whether brothers or adult sons, rather than live alone.

Health

Health Care Access

Health and health care access is in severe crisis due to the ongoing Syrian Civil War. As of January 2016, the World Health Organization (WHO) reported that more than 640 health care workers had been killed since the conflict began, representing a 45 percent drop in available health care professionals in the country. A staggering 58 percent of public hospitals and 49 percent of primary health centers are just partially functioning or have closed completely; some have even been deliberately bombed. The loss of basic utility services has had a disastrous impact on the existing health facilities. Locally produced pharmaceuticals are 70 percent less available, and there is a severe shortage of skilled birth attendants. Diseases, including cholera, diarrheal diseases, typhoid, and hepatitis A, are surging, particularly in areas housing displaced persons within Syria. Malnutrition is rampant. Severe mental illness is impacting at least 600,000 Syrians, and it is estimated that one out of every four children is at risk for mental illness (WHO 2016a).

"In Syria today, there are 15 besieged areas where up to 700 000 people, including an estimated 300 000 children, still remain trapped. Nearly 5 million people, including more than 2 million children, live in areas that are extremely difficult to reach with humanitarian assistance due to fighting, insecurity, and restricted access" (WHO Joint Statement on Syria 2017). In December 2016, WHO responded to the fighting in Aleppo by medically evacuating 200 patients from East Aleppo, and 94 with traumatic injuries were treated immediately. Common injuries

include eye and brain damage as well as complications of chronic conditions such as diabetes that had gone untreated during the siege. Many more people in Aleppo were in need of medical attention than could be evacuated (WHO 2016). UNICEF estimates that 6 million Syrian children are in need of humanitarian aid.

Before the civil war began, Syria spent 3.2 percent of its gross domestic product (GDP) on health care, and life expectancy was 70 years for women and 60 years for men (WHO). Thirty-five percent of the population was under the age of 15, and the median age was 22 years old, with 57 percent of the population living in urban areas. The government was able to finance complete vaccinations for children. Now, humanitarian aid is supplementing immunization needs. The most common cause of death for children under 5 years old was prematurity, and the mortality rate was 15/1000 in 2013 (WHO).

Maternal Health

Fifty-eight percent of women used some form of contraception. Most birthing women were attended by a skilled birth attendant (96.2%) and had attended at least four antenatal appointments (63.7%) (UNICEF). The maternal mortality rate was 49/100,000, and Syrian women had only a 2 percent likelihood of dying from maternal causes (WHO).

Diseases and Disorders

HIV rates are very low, and comprehensive knowledge about HIV/AIDS is low. Elevated glucose levels and high blood pressure were the leading risk factors for women in 2008 (WHO). The leading cause of death in Syria is the conflict. In 2012, 43.7 percent (59,000) of Syrians died because of the civil war (WHO). The number two cause of death was heart disease at 23 percent (WHO).

Employment

Syria's economy rests on agriculture; manufacturing (primarily cotton textiles, although these jobs are fading through competition from China); raw materials, such as phosphates for fertilizer; and moderate levels of oil production. Most manufacturing jobs are seen as inappropriate for women, and agricultural work and domestic service are considered unattractive or unacceptable by many families because they are physically demanding or bring women into too much contact with nonrelated men.

The careers available to women are shaped by their location, education, ethnicity, and marital status. If necessary, young women in rural areas are likely to work on small farms as unpaid agricultural workers or, more often, limit their work to helping within the home. Opportunities for paid employment for women in urban areas are more varied, but they are similarly affected by education and the degree to which a woman's male relatives support her working for pay, particularly outside the home.

Urban women in poorer households, especially those with high school or lower levels of education, have few opportunities for employment. They may work in a small family business (especially if they may do so from home) or do sewing, make crafts, set up a hairstylist shop at home, or sell extra produce to neighbors. Some work as housekeepers for families in wealthier parts of the city, but they do so clandestinely, as families generally disapprove of this type of work because it creates the impression that the family is desperate for income and that husbands, fathers, or brothers are not good providers. These types of informal-sector employment account for nearly half of entry-level employment in rural areas (ILO 2010).

Women in urban areas with higher levels of education have greater opportunity, although those opportunities are still shaped by the preferences of male relatives. Young women most frequently work in retail shops, offices, banking, tourism, or education. Having more education broadens the types of jobs that women can do and also provides rationale for convincing male relatives that they seek employment not out of economic need but as a way to develop personally and give back to the community. Although they lag behind male counterparts in engineering and sciences, women are employed at comparable rates within agriculture, the arts, and some clerical white-collar jobs. Elite women are often involved in voluntary philanthropic, cultural, and artistic activities. A small but growing handful of women entrepreneurs have emerged over the last decade, opening shops for women's clothing, crafts, and household goods. These women struggle with patriarchal assumptions of the business community, often having to have husbands come along to sign contracts or negotiate purchase of retail space.

Women's experiences with employment reflect a number of tensions between the values and policies of the Baath Party and gender ideals around women's dependency and men's responsibilities for the household. Managing these two sets of values is made more complicated by the stagnation of Syria's economy, the decline of international aid,

the uneven political and economic reform under President Bashar al-Asad, and the persistent regional tensions with Israel, Turkey, Lebanon, and Iraq as well as the West. The constitution guarantees women “all opportunities availing them to fully and effectively participate in the social, cultural and economic life [and] removes the restrictions that prevent women’s development and participation in building the socialist Arab society” (Syrian Constitution, Article 45).

Although women’s economic independence has a long history of support within Islam, men are perceived as primary providers—often working two or three jobs to keep families afloat. A survey done by the Syrian Central Bureau of Statistics in 2009 showed that more than 40 percent of Syrians believed women and girls should not be employed under any circumstance. Eighteen percent approved of women’s employment only when economically necessary, 11 percent only if it did not interfere with other responsibilities, and 2 percent only if the workplace was gender segregated. Less than a quarter believed women’s employment was acceptable under any circumstance (ILO 2010).

Social class, education, and Syria’s changing politics and economy also play important roles in shaping women’s employment. For centuries, rural women and girls worked in agriculture and as shepherds on land owned by tribal leaders. During the second half of the 19th century, these occupations dwindled as small farming shifted to larger scale cotton production managed by urban landowners and, later, by state-owned and managed mega-farms modeled after those in the Soviet Union. In the first decade of the 21st century, the state returned large tracts of agriculture to rural resident control, and rural women began to have greater opportunities to work in smaller scale farm production again.

In 1995, 46 percent of employed women were counted as “unpaid family workers” working on farms in rural areas or at home for small family businesses; 27.7 percent of employed women and 25.2 percent of employed men worked in the public sector. Since then, the distribution of employment has remained relatively stable for men, but more and more women have been moving into the public and informal (paid but not regulated or counted) sectors of the economy. By 2010, 60 percent of employed women worked in the public sector, and only 11 percent of women workers remained counted as unpaid family labor (CBS 2010). Retirement from public-sector jobs is at age 60, and while bloated bureaucracies and overemployment in manufacturing leave some workers with very little actual work to do during the day, job security and

long-term retirement benefits make these jobs attractive, especially when there are few alternatives. Approximately 20 percent of urban women in their midtwenties are in the labor force, while among middle-aged women (those more likely to be married with children), labor force participation is about 15 percent (about double what it was in 1990).

Even with these increases, women’s employment is generally seen as something most appropriately done for personal development or contribution to society rather than a way to help support a family. Most young women withdraw from the labor force once married to focus their energies on supporting husbands and being the primary parent at home. Only 25 percent of all Syrian women are employed within two years of leaving school. Nearly the same number of women have transitioned in that same time to full-time housework as wives and often mothers. (By comparison, two-thirds of Syrian men are employed within two years of finishing school, with men’s employment overall standing at about 80 percent.) Rates of employment among women in rural areas are even lower.

Pay and Benefits

According to the Constitution, work is a “right and duty of every citizen” (Article 36). The state has responsibility to determine working hours, provide social security, and regulate leave time and compensation. Within the private and informal sectors, wage disparity is much greater than in government positions, with many women working for very little in small businesses or as unpaid family laborers in rural areas.

In government positions, pay for women is equal to men for performing similar work. Women working in government jobs also benefit from relative job security, paid maternity leave, and the availability of public nursery schools. Government employment is made easier for women because of extensive and generous maternal and child care leave policies. Women working in companies employing 100 or more persons are guaranteed paid leave around pregnancy and delivery, including 60 days of maternity leave, unspecified leave before delivery, sick leave during delivery, and 40 days of obligatory leave following delivery. A total of six months is allowed, all at full salary. In addition, nursing mothers are allowed two half-hour periods per workday for breastfeeding for up to a year and a half following delivery.

These policies, as beneficial as they may be, are only available to a small proportion of Syria's working women.

Family Life

Across ethnicity and religious background, family connections and relationships are central to women's lives. Personal identity (for men as well as women) is embedded in networks of relationships with immediate and extended family. For women, this is heightened by general dependency on fathers, uncles, husbands and brothers for material and social support.

In urban areas, parents and children are on their way to work or school by seven in the morning. Businesses are generally closed between two and five for lunch, after which men return to work for a second shift or second job. Leisurely evenings are spent visiting relatives or at home with a light but late meal, around ten or eleven is the preferred ideal. As prices for basic goods and services have skyrocketed over the past decade, particularly since the start of the civil war, family time has dwindled as households struggle to maintain family wages. Men's absence from the household because of second and even third shifts of work increases the burden on wives and mothers to manage household and children on their own, making even married women's lives more like those of single parents. Participation in networks of exchange with extended family as well as trusted neighbors help women bridge income and expenses. Exchange both redistributes resources and reinforces alliances that are especially important for women for whom opportunities for economic and social independence are limited.

Marriage

Across class, it is still fairly common for parents to be highly involved in the selection of a marriage partner for their children. Parents provide connections, screen candidates, and negotiate the material goods each party will bring to the marriage for nearly 70 percent of all marriages. By law, girls may marry as young as 16 years old and boys as young as 18 (although with parental permission, a judge may allow boys to marry as young as 15 and girls as young as 13 years of age). A generation ago, it was common for girls to marry around age 14 or 15. Girls in villages may still be married off by their parents as soon as they reach puberty. In urban areas, girls in very conservative religious families may marry in their late teens; however, most marry in their early twenties, after they have completed

high school or some university study. Their husbands are often 5–10 years older because men delay marriage until after they have completed their mandatory military service, become established in a job, and, ideally, purchase and furnish a home. Marrying against parents' explicit wishes can jeopardize women's long-term well-being, as parents and extended family are the safety net to which women turn in cases of abuse, abandonment, or divorce.

By law, parents and guardians are forbidden from forcing daughters (or sons) to marry without their consent. Parents do not typically sign contracts for their children's future partners at birth, nor are most young people forced into marriages against their will. In practice, the notion of "semiarranged" gets closer to the reality of the experience for most young women. Sons who are economically established and ready to marry will ask their mothers for help in identifying a prospective bride, offering their own suggestions in addition to those their mothers believe are from suitable families. Young women approached by their parents with the offer of marriage from a family friend or close cousin are asked what they think of potential suitors and given multiple opportunities to turn down those they find unacceptable.

In the best-case scenario, parents who love their children and are not faced by the need to marry off a child as a matter of survival are keenly interested in helping children locate and screen suitable partners. In many households, marriage between cousins account for about 27 percent of all marriages in urban areas and 36 percent of all marriages in rural areas (Othman and Saadat 2009); cousins are well-known, and the marriages strengthen family ties. High expectations are placed on children to fulfill their religious duty to please their parents, and the notion that one's own children will treat you the way you have treated your own parents encourages young women to respect their parents' good judgment. Brothers are often active in the process, intervening both before and after a marriage to protect their sisters from men who do not appear to have their best interests in mind; sisters help coach young brides as they become integrated into new networks of kin. When things do not go well, parents, siblings, cousins, and close family friends all may intervene to help couples resolve difficulties and live amiably together (Gallagher 2012).

Sexuality

Syria is a reserved society when it comes to demonstrations of affection in public. Girls may link arms and young men

hold hands while walking together. However, this type of physical affection is reserved for same-sex friends. Across religious and ethnic groups, Syrians are very conservative when it comes to sexuality and sexual intimacy. Within the majority Muslim population, physical contact is prohibited between nonrelated individuals. These restrictions are relaxed somewhat during engagement, when couples begin to have time alone in public and while visiting family. Engaged couples may hold hands, and a prospective bride may begin to spend time with her fiancé without covering her hair. After the ceremony in which the names of the couple are written in the marriage registry, additional intimacy is allowed. However, couples are expected to refrain from intercourse until after the wedding when the bride moves into her husband's home. Homosexuality is outlawed, and openly gay men and lesbians are ostracized by family and may be imprisoned for up to three years. As with heterosexual intimacy outside of marriage, same-sex intimacy places individuals at risk of being victims of an honor killing by relatives.

Household Responsibilities

The division of household responsibilities in Syria is quite gender-based. In many households, men shop for groceries and other household items on their way home for a midday meal, but the labor-intensive work of meal preparation, child-rearing, and housework are women's jobs. Wives, daughters, and sisters spend much of their days cooking, cleaning (assuming they have no other paid domestic help), and visiting with relatives and neighbors. The amount of time devoted to each is shaped by social class as well as proximity to relatives. As urban areas have become more densely populated, younger families have moved into outlying areas where housing is less expensive but customary daily trips to visit parents are considerably more difficult.

Politics

Rights and Participation

Syrian women received the right to vote in 1953, and all female citizens over the age of 18 have the right to participate in elections. Elections up until recently have been limited to candidates from the president's Arab Socialist Baath Party, with the president himself being consistently reelected by over 90 percent of the vote. Records are not

available for what percentage of women actually casts ballots.

A strong internal security service has long dampened political debate within Syria. The country was under an official state of emergency for nearly 50 years (1963 to 2011) because of conflict with Israel over the Golan Heights. This state of emergency allowed the government to restrict assembly, establish special security courts, and maintain broad powers for security personnel. These were removed during the early phases of the current civil war; however, dissent remains very dangerous. The government continues to control and heavily censor both public speech and the media, including television and the Internet. Nevertheless, a small but growing number of women are active in explicitly political associations seeking to bring about reforms that protect and enhance women's rights vis-à-vis the government and conservative religious extremists.

Women make up approximately 12 percent of all members of Parliament. Syria's Women's Union is the official association sponsored by the government. It is a forum for mobilizing activists on behalf of equal employment and child care facilities for career women, and it provides a voice for popular concerns within Parliament as well as a venue through which the state may channel sentiment around social change. Women are increasingly active in civil unrest, protesting and demonstrating both in favor and in opposition to the government and occasionally engaging in military efforts to overthrow the regime.

Religious and Cultural Roles

Across religious communities, formal and informal practices and beliefs are blended in women's everyday experience. Women are expected to fulfill the same religious duties as men in terms of prayer, giving to the poor, fasting, and upholding a high standard of personal moral behavior that demonstrates respect for oneself and others. Women from Muslim backgrounds are expected to pray five times daily (with missed prayers made up at a later hour) and often rise before dawn to pray before preparing an early meal for husbands and children. Muslim women may also go on pilgrimage to Mecca with male relatives and be leaders of informal religious discussion groups. In addition, women visit religious shrines and participate in informal religious practices. Invoking the name of God for protection when getting in or out of a microbus, greeting a mother and child with a blessing to ward off a spirit of jealousy, drinking from a special cup to calm fears that a

reputation might have been harmed by some inappropriate behavior, or picking up a piece of bread fallen in the street and placing it on a wall or windowsill are all as salient expressions of religious values as daily prayers, fasting, and giving to the poor.

The practice and styles of women's head covering is complicated in that the Koran is interpreted differently in different communities and the veil (as a symbol of modesty) is understood as form of political resistance as well as accommodation by different sects, regions, and social classes. In fact, in 2010, the burqa and niqab were banned at universities, eliciting outrage that was mitigated over the next year for schoolteachers who had refused to uncover. In 2014, militant fighters demanded that all woman wear the veil, but it is unclear what effect this has had on actual practice in the country.

While the law prohibits discrimination on the basis of religion, religious minorities face day-to-day discrimination and are victims of violence in areas of social unrest. The burning of minority places of worship, forced eviction, confiscation of property, rape, and acts of violence are on the rise, especially in areas controlled by radical Islamist groups such as the Islamic State (IS). The threat of rape, enslavement, or death is a particular danger for women and girls living in these areas.

Issues

Family laws codified in the early 20th century synthesized several schools of Islamic law with pre-Islamic patriarchal and tribal customs that preserved specific rights for women. Among the most important of those are the right to contract for their own marriages, receive a dowry, retain control over their own property, receive basic income "maintenance," and receive a share of inheritance. Within this same legal system, however, personal status laws legalize numerous forms of discrimination against women. These laws provide easier divorce for men, lenience for honor crimes, and more severe penalties for adultery for women, and they allow men convicted of rape to avoid penalty if they agree to marry their victim. Muslim women are restricted in their ability to marry non-Muslim men and to own property or start their own business without a husband's approval, and they are unable to pass their nationality on to their children if they marry non-Syrian men. Because the government tightly regulates the formation of groups and meetings of individuals who might oppose its policies, efforts to change these laws are limited

Refugees of the Civil War in Syria

According to the United Nations, nearly 6.5 million people have been displaced due to the Syrian civil war that began in the spring of 2011. Almost 50 percent of the 4,799,677 registered refugees that have fled Syria are women, and almost half of these women are between 18 and 59 years of age. Syrian refugees in Turkey number 2.7 million, in Lebanon 1 million, in Jordan 655,000, and in Iraq 239,000; Egypt has an additional 135,000 that was absorbed by North Africa. Germany and Serbia (with Kosovo) have taken in 64 percent of the refugees in Europe, followed by Sweden, Hungary, Austria, the Netherlands, and Denmark with 24 percent.

The refugee crisis has elicited political controversy in Europe and around the world. Underfunding across the region affects the following areas identified by the United Nations as critical for refugees: protection, food security, education, health and nutrition, basic needs, shelter, hygiene, and livelihoods. Poverty rates are high in refugee communities, and when basic needs are not met, education rates go down. Resilience is a key marker for transition success for refugees, and education and jobs are important to sustainability and hope.

—Kryn Freehling-Burton

to online discussions or an occasional article in a woman's magazine or newspaper opinion piece.

Violence

While ostensibly protected by both religious and civil laws, women and girls are subject to male authority within households. Fathers, brothers, and uncles may restrict their movement and may use emotional or physical intimidation to restrict women's and girls' behavior. While there are no official statistics available on domestic violence, a United Nations study in 2006 estimated that one-quarter of Syrian women are victims of physical violence (Roumani 2006). Women themselves describe the problem as widespread, and few have resources to detach themselves from abusive relationships.

The most extreme cases of violence against women are "honor killings," where a woman is killed by a male relative

on the grounds that he was “provoked” by discovering her in an “illegitimate sexual act” (e.g., being sexually intimate with anyone other than a husband) or “suspicious state.” Prior to 2009, the law exempted perpetrators of honor killings from punishment on the grounds that the perpetrator acted unintentionally (unpremeditatedly) in a blind rage in an effort to purge the family honor. In 2009, President Bashar al-Asad replaced the existing law with one that required a sentence of at least two years for such crimes.

Violence against women has been exacerbated by Syria’s civil war. Women are victims of assault, harassment, rape, beating, and torture from fighters from all parties (e.g., violence is not limited to government forces or religious extremists, see HRW 2014). In 2014, the United Nations estimated that 145,000 Syrian refugee families (nearly one out of every four) were headed by mothers whose husbands had been killed or captured or had disappeared or otherwise become separated. Many women struggle with violence against themselves and their children (UNHCR 2014). Only a handful of shelters exist in Syria: one in Damascus sponsored by an unregistered nongovernmental organization (NGO), a second sponsored by the state specifically for trafficked women, and a third also sponsored by the state for victims of domestic abuse in Aleppo.

Refugees of the Civil War

According to the United Nations, nearly 50 percent of the 4,799,677 registered refugees that have fled Syria are women; almost half of these women are 18–59 years of age. Nearly 6.5 million people have been displaced. Syrian refugees in Turkey number 2.7 million, in Lebanon 1 million, in Jordan 655,000, and in Iraq 239,000. Germany and Serbia (with Kosovo) have taken in 64 percent of the refugees in Europe, followed by Sweden, Hungary, Austria, the Netherlands, and Denmark with 24 percent. The refugee crisis has elicited political controversy in Europe and around the world. Underfunding across the region impacts the following areas identified by the United Nations: protection, food security, education, health and nutrition, basic needs, shelter, wash, and livelihoods.

Inequality

While patriarchy is meant to provide women protection, provision, and connectedness, it also limits women’s experience in significant ways. In Syria, women’s lives are

governed by civil and religious laws that codify the legal and social subordination of women to men within families. Divorce, inheritance, and child custody are examples of social and economic inequality that figure large in the minds and experience of Syrian women.

Divorce

According to official statistics, Syria’s divorce rate is approximately 13 percent (Central Bureau of Statistics 2010). By law, a man may divorce his wife by repudiation—by saying “you are divorced” three times. In the past, husbands could unilaterally divorce their wives by repeating the phrase three times in one session, leaving wives susceptible to instantaneous divorce by a husband angered by some offense or failure, whether large or small. This changed under the Baath Party rule, so the law now requires pronouncement of divorce to take place at three different times so as to allow greater opportunity for reconciliation and to prevent divorce in cases where a husband’s judgment was temporarily impaired by anger, intoxication, sickness, or psychological distress. The law also requires that application for divorce be made through the courts and that wives be notified of the proceedings.

Syria was the first state in the region to allow the courts to require husbands to pay maintenance to former wives for up to three years. A woman who is divorced is entitled by law to the unpaid portion of her dowry as well as maintenance payments for as long as she retains custody of any children age two or younger.

Women may also file for divorce, but only under specific circumstances. These include a previously unknown defect in the husband that prevents him from having sexual intercourse, insanity, abandonment, a greater than three-year prison sentence, and failure to pay his wife’s maintenance. Either spouse may apply for divorce on the grounds of discord that causes such harm that they can no longer live together. In the latter cases, divorce is granted only after the court and appointed family members have attempted and failed to bring about reconciliation. Women may file for divorce for adultery only if they are able to document that sexual intercourse took place within the family home, whereas there is no such requirement for men. Overall, while divorce law strongly favors men, recent reforms have begun to provide greater protection for women, although protections are still thinly and unevenly applied.

Although the law allows for equal division of property acquired during a marriage, women generally have no

documentation of purchases made with their own money. When people shop, they pay cash. There are typically no receipts given with a purchase, and because credit purchases are rare, if a woman buys a coffee table, or dresser, or refrigerator, or other items for the household, she has no way to document the purchase. Women are entitled to ask that they be registered as owner of a house or its contents when they marry, but most are reluctant to do so because men resist or accuse women of planning divorce. Women are deeply worried about divorce because the feeling is that when a woman divorces, she leaves the house with nothing but the clothes on her back.

Inheritance

Inheritance law for Syria's Muslim majority is shaped mostly by Hanafi legal principles applied through Syria's Personal Status Laws. According to the Koran, sons inherit twice as much as daughters, while a surviving wife inherits only a fraction of the family estate. If a man dies leaving a wife and two boys and two girls, his wife inherits an eighth of his estate, his sons a third, and his daughters each a sixth. The application of this principle under various family configurations is much more complicated than saying a daughter's inheritance is half that of her brothers. For example, women are entitled to financial support from their male relatives because the law recognizes that women inherit less. Thus, an adult son is obligated to financially support an unmarried sister who has no husband once their father dies. If he fails to do so, she has the right to sue him for that support. (The underlying principle is that wealth should remain the property of male heirs within the family of origin, rather than flow to the family of a spouse or to children.) Yet, in many cases, women are not aware of their rights, and so they turn over property to male relatives. While changes in women's status and rights under the law and educating women about those changes would improve women's independent access to resources, that independence runs against the grain of mutual interdependence that is foundational to the sense of self, social, and economic security in Syrian society.

Child Custody

In 2003, family law was revised to allow divorced women to retain custody of their daughters up until they are age 15 (rather than age 11) and sons until they are age 13 (rather than age 9). While advocates argued this change was beneficial to women, the practice shifted child-rearing

responsibilities to fathers at the age when children were closer to completing their education and becoming able to contribute to the household economy. Moreover, it created greater inequities in the remarriage market because men were reluctant to marry divorced women and even more reluctant to marry divorced women with children. In practice, mothers generally continue to retain custody of their children until they are grown, serving as caregiver but not legal guardian (e.g., mothers may not change residence with the children or register them for school). Most often, men remarry as soon as possible following a divorce, and new wives are reluctant to care for children from a previous marriage. Should a woman remarry, she may lose custody of her children, while men who remarry retain custody as long as they wish.

Trafficking

Although President Bashar al-Asad has signed the International Declaration of Human Rights, the political uncertainty and violent unrest of the civil war have created conditions in which women and children are increasingly at risk of trafficking. Prior to the civil war, Syria was primarily a destination for trafficking in women brought from the Philippines, Somalia, or Ethiopia to work as domestic servants (U.S. Department of State 2013).

Syria is a country of contrasts in terms of women's rights. Government policies keep prices for basic necessities within the reach of most households, and programs of child care, education, and equal earnings in similar public-sector jobs are more substantial than those in many other nations in the region. The current civil war, on the other hand, increases the vulnerability of women and girls to violence, rape, and displacement. Yet, these disruptions also create opportunities for women (many of whose traditional providers and protectors are absent or deceased). Women are now more likely to be earning income, navigating bureaucracies, and exercising control over their own lives as they struggle to rebuild their country.

T

Tunisia

Overview of Country

Tunisia is a North African country located on the southern shore of the Mediterranean Sea, across from Italy. It occupies a strategic position at the straits that separate the eastern part of the sea (between Africa and the Middle East) and the western part (between Africa and Europe). Tunisia's position as a crossroads between three continents (Africa, Asia, and Europe) has, since the founding of Carthage by Queen Dido in 814 BCE and Hannibal's battles with the Roman Empire, given the country a complex historical and cultural depth. It is small, geographically (63,169 square miles or 163,610 sq. km), and the population is around 11.2 million (CIA 2015).

Tunisia is a majority Muslim country (99% Sunni). The population is mainly Arab at 98 percent, European at 1 percent, and Jewish at 1 percent. Black activists estimate the black population at 10–15 percent, but Tunisian demographic authorities do not use skin color as a parameter. The official language is Arabic, with French being used often in commerce and Berber (Tamazight) still being spoken in a few communities. In 2014, the UN Development Programme (UNDP) ranked Tunisia 90th out of 187 countries, placing it in the “high human development” category (CIA 2015).

Topographically, the country is divided into three distinct regions: the fertile northern region, which explains

why the country has been known historically as “Tunisia, the Green”; the central region containing arid steppes in the interior and extensive olive groves in the *sahel*, or coastal region; and the south, with its spectacular date palm oases, its iridescent salt flats, and the Sahara Desert, which covers the bottom third of the country and boasts a bit of oil, but not much.

Since winning independence from the French colonial occupiers in 1956, Tunisians have experienced three periods of governance: the government of President Habib Bourguiba (1956–1987), the government of President Ben Ali following a bloodless coup (1987–2011), and the transition to democratic governance after the January 2011 revolution marked by the flight of the dictator Ben Ali and the initiation of the Arab Spring in the region. In all three periods, the governments strongly supported progressive policies on women's rights, from the initial Code of Personal Status developed by Bourguiba in 1956 and instituted even before the Tunisian Constitution, to the continued strengthening of those rights under Ben Ali, to the post-revolutionary transition governments that wrote the new Tunisian Constitution (2014), which states in Article 21:

All citizens, male and female, have equal rights and duties, and are equal before the law without any discrimination.

The state guarantees freedoms and individual and collective rights to all citizens, and provides all citizens the conditions for a dignified life.

Having promulgated legislation and instituted practices to address the three deficits identified by the Arab Human Developed Reports (AHDR) that afflict the Arab region—empowerment of women, knowledge acquisition (education), and freedom as defined by human rights and good governance—Tunisia is considered as one of the most progressive Arab countries. A historical overview of Tunisia since independence (1956) shows that measures to address women's empowerment and to strengthen education were taken from the start (after France left), but freedoms guaranteeing respect for human rights and good governance only began to become a reality following the January 2011 revolution. Tunisia's Code of Personal Status, which went into effect in 1957, embodied significant measures affecting the lives and well-being of women and girls: it forbade polygamy and repudiation (divorce based on a verbal statement by the husband), instituted legal divorce proceedings, promoted consensual marriage based on the free choice of the two spouses, and set legal ages for marriage for both males and females. When Bourguiba instituted a National Family Planning Program in 1964, providing increased access to contraception, sterilization, and abortion and encouraging the norm of small families, it was the first such program in the Arab world and in Africa. On a 1966 visit to Tunisia, the chair of the Population Council Board of Trustees, John D. Rockefeller III, asked Bourguiba how he came up with these progressive ideas. Bourguiba replied, "I've got a lot of brains" (Brown 2007, 67).

Although measures to empower women, improve literacy, increase access to education and health care, and improve working conditions were top-down, they have been widely embraced and accepted by Tunisians. As the "father of nation," Bourguiba commanded respect, but his autocratic approach to governance led to a severe weakening of the system in the mid-1980s. Ben Ali removed him in the November 1987 coup. However, Ben Ali himself quickly became a dictator feared and despised by the people.

While women's empowerment and access to knowledge have progressively increased over the decades, it took a revolution to achieve good governance. Women and young people were deeply involved in this revolution. Tunisia went through an extremely rocky period during the 2011–2013 transition to a democratic system. Tunisians struggled with economic instability, institutional reforms, the establishment of the cornerstones of good governance, and the reconciliation needed for those who had suffered human rights abuses. Part of that transition included a

What Is the Arab Spring?

In December 2010, a fruit vendor in a small Tunisian town was refused the right to earn his living without the proper permit. In anger and humiliation, Mohamed Bouazizi went to a government building and set himself on fire. This was the beginning of the Arab Spring. People immediately joined in the revolt, documented it with their phones, and posted photos and videos on social media. As the world watched, the dictatorship of Tunisia was successfully overthrown in January 2011. This success spawned several revolutions in the Middle East and North Africa region (MENA). Egypt's dictator of 30 years, President Hosni Mubarak, stepped down in February 2011.

Women were on the front lines as the people of Libya, Syria, Yemen, Algeria, Iraq, Jordan, Kuwait, Morocco, and Oman all revolted against leaders they believed unjust. There were varying levels of success. In fact, many of these revolutions are ongoing. Some have mired the countries in war for all these years, largely due to third parties that wish to gain power in the vacuums left by collapsed governments. MENA's revolutionary change will be a long-term process, but assured women will continue to fight for justice for themselves and their families.

—ReGina E. Kaylor

point in 2013 when widely divided politicians and general social unrest led to a mediation of differences by four civil society groups (nongovernmental organizations, or NGOs)—the Tunisian General Labor Union; the Tunisian Confederation of Industry, Trade and Handicrafts; the Tunisian Human Rights League; and the Tunisian Order of Lawyers. For their role in establishing good governance, this group, known as the Tunisian National Dialogue Quartet, was awarded the 2015 Nobel Peace Prize.

While the legalization of women's rights in Tunisia has a strong foundation, reaching the goal of gender equality is an ongoing process with need for improvements both in governmental policies and in customary practices, which lag behind the progressive laws. Numerous civil society organizations have kept attention focused on women's rights in Tunisia. The International Planned Parenthood Foundation (IPPF) office for the Arab region is in Tunis,

as is the Center of Arab Women for Training and Research (CAWTAR), which monitors women's status in the Arab world and advocates for gender equality. The Center for Research, Studies, Documentation and Information on Women (CREDIF) conducts research on women and their status in Tunisian society as well as on their contributions to the development of society, under the auspices of the Ministry of Women, Family and Childhood. The Association of Tunisian Women for Research and Development (AFTURD) founded by Tunisian university women, has, since the mid-1980s, done research to understand and explain the obstacles to women's effective participation in social, economic, and political life. The Tunisian League of Human Rights, and the Tunisian Association of Democratic Women carried out courageous defense action in favor of women's rights, despite harassment under Ben Ali. One of the oldest women's organizations in Tunisia is the National Union of Tunisian Women (UNFT), which was formed in 1956 and was, until the revolution, state-sponsored. UNFT had outreach in every region and many cities but was closely tied to the repressive regime that funded it. Postrevolution, the UNFT faced legal challenges and bankruptcy, and the current government (2015) is looking into the case.

Before the 2011 revolution, the majority of Tunisians suffered from lack of free speech and from the threat of severe punishment for those who did speak out, including Islamic activists (who went into exile or prison), minorities, and LGBT people. The postrevolutionary period has seen a flood of organizations exercising free speech and advocating for the rights of minorities. Examples include the Association for Equality and Development (ADAM, founded in 2012); the "Equality Caravan" organized by black Tunisians protesting racial discrimination in daily life; and various organizations advocating for LGBT citizens, such as the Tunisian Association in Support of Minorities, Tunisian Association for Justice and Equality (DAMJ), and the SHAMS association to decriminalize homosexuality in Tunisian law. In October 2015, the prime minister sacked the minister of justice who stated that Article 230 of the Constitution, criminalizing consensual sex between men, was one of several laws that are inconsistent with the country's new Constitution, especially Article 21 (Middle East Eye 2015; Constitute 2014).

Girls and Teens

The sex ratio at birth in Tunisia is 1.07 males/females, and it remains relatively balanced throughout the life cycle,

with the exception of the age group 25–54 years, where the ratio is 0.95 males/females (largely due to male migration for work) and the group 65 years and over, 0.96 males/females (Index Mundi 2015). Attendance in primary school shows parity between boys and girls. Girls begin to outnumber boys at the secondary level, and the World Economic Forum's 2015 Global Gender Gap Index ranks Tunisia first out of 145 countries for enrollment of women in higher education (1.62 females/males). The literacy rate for youth 15–24 years of age is 98 percent for males and 96 percent for females.

Tunisia was the first country in the Middle East and North Africa (MENA) region to introduce information on reproduction and family planning into its school curriculum (early 1960s). The National Office for Family and Population has posted information online specifically addressed to youth in a changing world. The site has sections on AIDS and sexuality, youth and celibacy (chosen or imposed), tobacco use, and domestic and social violence. Question-and-answer sections address premarital consultations, contraceptive methods, infertility, sexually transmitted diseases, cancer, and menopause. Tunisians on average marry relatively late (age 27 for females and 32 for males): only 1 percent of youth 15–19 are married, and 14 percent of those aged 20–24 are married.

Family is central to most Tunisians, whether their worldview is liberal or conservative. It has been the institution that has served as a support network when other institutions—economic, political, or social—fail. Much socializing is done within the family network, and a significant number of young people live with their families until they marry. Within many families, gender dictates the tasks boys and girls do, and male children are still generally privileged compared to females and given more freedom of expression and circulation. Even for families who have migrated to cities, identification with place of origin is strong, and family reputation is an element of identity for all members of the family.

Today, girls and teens must navigate a contradictory set of expectations. Given their level of education, access to global information via the Internet and television, positive attitudes about family planning, and the progressive laws about women's rights, Tunisian girls and teens have many opportunities and advantages in life. Coming from a tradition where identity is strongly other-centered and family loyalty is a primary concern, Tunisian girls experience the contradictions that arise where patriarchal attitudes are still prominent, customary divisions around gender

structure behavior, and youth reach maturity long before they reach the average marriage age. Tunisian young people participate in youth centers, civil society organizations, and organized sports.

Health

After independence, President Bourguiba took a number of steps to improve health care. At the end of the French Protectorate in 1956, Tunisian life expectancy was 47 years, the mortality rate 25 per 1,000 inhabitants, and the population growth rate 3.0 percent. Of a population of almost 4 million, 46.5 percent were under the age of 15. Today, Tunisian life expectancy is around 74, the mortality rate is 6 per 1,000, and the population growth rate is 0.92 percent. Of the 11.2 million, 23 percent are under age 15, and 7.5 percent over age 65 (Index Mundi 2015).

The remarkable progress Tunisia made in improving these key indicators can be tied to the early policies Bourguiba implemented concerning health care, many of them focused on women's health needs, and universal education. As he had done with the Code of Personal Status, Bourguiba initiated changes by using his abilities as a consummate politician. Bourguiba had vastly expanded women's rights by having the Code of Personal Status be instituted first as a Beylical Decree by Tunisia's outgoing Bey (King) in 1956, before Tunisia became a republic and Bourguiba took over as president. Thus, he established shared responsibility for this unprecedented change in women's rights between the traditional system and the new government. In addition, he obtained the approval of influential Islamic judges concerning the content of the code by framing these rights as reinterpretations that were consistent with Islamic law. For example, while religious law may allow polygamy, saying a man may have up to four wives, the additional requirement is that they be treated absolutely equally. This, Bourguiba maintained, was a human impossibility, thus the texts were reinterpreted as being arguments for monogamy (Riddell 2009, 82). Instituting a progressive family planning program followed this same pattern of Islamizing modernization by demonstrating that health care goals were consistent with Islamic teachings and Muslim society. While religious views did not support birth control as prevention, they did support "planning" as a benefit to family and society. Although socioeconomic conditions improved for Tunisians in the late 1950s, the fertility rate remained high at 7 births per woman.

In 1961, Tunisia became the first former French colony in Africa to abolish a 1920 French law that forbade the promotion and use of contraceptives and outlawed abortion. In 1962, Bourguiba spoke out about family planning with an eye to the well-being of future generations: "With our rapidly growing population, the rising generations are exerting pressure on us. If we are not careful now, in ten to twenty years' time, there will be a marked disproportion between the national income and the number of people we have to feed" (Winkler 2005, 119). Thus, planning population growth became a national duty and involved improving health care and education for women, two factors tied to lower birth rates.

As soon as contraception became available and free in 1963, Dr. Tewhida Ben Sheikh opened a family planning clinic at Charles Nicole Hospital where she was head of the Gynecology Department. Ben Sheikh was the first woman doctor from the Arab world, graduating from medical school in Paris in 1936. She was the first Tunisian woman to receive a baccalaureate (high school) degree. By 1964, Tunisia had adopted a national family planning program. Among the strategies to limit population growth were access to abortion during the first trimester and if the couple already had four children. In addition, government subsidies for children were limited to only the first four children. Family planning had become an openly discussed topic, and there was no religious objection to it. In 1966, abortion was legalized for any reason (within gestational limits) and without requiring the husband's approval.

Dr. Ben Sheikh, with others, started the first family planning clinic of the Tunisian Family Planning Association, Mont Fleury clinic, which became a model clinic and trained doctors from around Francophone Africa in family planning. Tunisia's health care system continues to be considered one of the very best in Africa and the Middle East because of its integrated approach to reproductive rights, its expansion of health coverage from the bottom-up (having started with coverage for the poor and vulnerable rather than in a trickle-down fashion), and the commitment of the government to cover health care expenses. The massive social unrest that led to the January 14, 2011, revolution was due, in part, to the unequal distribution of goods and services to various regions of the country. The Tunisian health care sector, while scoring 6 out of 7 for its performance by the World Economic Forum in its 2015 *Global Competitiveness Report*, nonetheless illustrates the challenges that face the effort to provide equal care. Article 38 of the 2014 Tunisian Constitution states that "health is

a right for every human being.” Thus, “The state shall guarantee preventative health care and treatment for every citizen and provide the means necessary to ensure the safety and quality of health services.” And further, “The state shall ensure free health care for those without means and those with limited income. It shall guarantee the right to social assistance in accordance with the law.”

In the MENA region, women’s access to health care can be hindered by traditions—religious and cultural—that insist on gender separation. This was not the case in postindependence Tunisia. Although this separation is a deeply rooted societal feature, Tunisia largely succeeded in transcending it. After 65 years of universal coed schooling and vigorous extension projects targeting adults, women’s and girls’ health care became easier with the acceptance of practitioners regardless of their gender. At the same time, the number of female doctors increased significantly. Tunisia went from one small faculty of medicine in 1965 to six major medical schools in 2015, including a pharmacy school and a dentistry school. All these schools are gender neutral both for student admission and for teaching careers. In Tunisia, 40 percent of doctors and 70 percent of pharmacists are female (Sidiqi and Ennaji 2013, 8).

After the 2011 revolution, the Islamic Party (or Ennahdha), formerly banned and persecuted by the Ben Ali regime, won a relative majority in October 2011 and became the dominant member of the ruling “Troika” (of parties) during the transition. This political makeup led to legitimate fears among women and secular activists that gender gains might be rolled back. They resisted and protested Ennahdha’s attempts to write into the new constitution such a rollback. This was one of the key factors that led to the standoff between the Troika government and civil society. Mass protests in the summer of 2013 led to the process initiated by the Tunisian National Dialogue Quartet, a mediation which literally brought the country back from the brink of civil war and was responsible for both Tunisia’s additional achievements in women’s empowerment and the peaceful transition to a democratic system of governance.

Access to Health Care

Tunisia’s health care system includes both public state-owned facilities and hospitals and private-sector medical care. State-owned facilities and hospitals provide free services to all Tunisian citizens and residents, with costs reimbursed for those seeking care at primary care health

centers, district and regional hospitals, and university hospitals. Health insurance is managed by the National Health Insurance Fund. The public sector, which in 2014 included 2,085 public health care clinics and 109 district hospitals, covers two-thirds of consultations and 90 percent of hospitalizations. Private medical services may also be covered if the condition is chronic or severe, as is hospitalization and surgery in some cases. Most dentists and opticians work in the private sector, and three-quarters of the pharmacists are in the private sector. Medical tourism is an aspect of the Tunisian economy, with the private sector offering affordable high-quality cosmetic surgery, spas, and thalassotherapy to foreigners, many from the European Union.

For many years, Libyans have sought health care in Tunisia that was lacking at home. In 2009, for example, 100,000 Libyans traveled to Tunisia for medical care. Following the Libyan revolution in 2011, Tunisians opened their homes and provided services to more than 300,000 Libyan refugees. In 2013, over half the clinic beds in Tunisia were occupied by Libyan patients, and the clinics were full to capacity, stretching the system to its limits and racking up multimillion-dollar medical bills that a failed Libyan state has not paid (Joyce 2013).

The Tunisian health care system illustrates the uneven distribution of resources that was one cause of the Tunisian uprisings in 2011. In 1956, Bourguiba established a national health care system as one of his immediate reforms to encourage the idea of social solidarity. Through the 1980s, services were improved, and health insurance was established for the employed. In the 1990s, investment in the system lagged, causing deterioration of services and infrastructure, and regional and class inequalities increased. The poorer, more rural regions of Tunisia have less access to medical professionals and the health infrastructure, have twice the rate of poverty (almost 30% more), and have higher maternal mortality. Other indicators of inequality, such as exposure to pollutants and high unemployment, have traditionally made these regions more at risk of negative health outcomes. Under the government of Ben Ali, environmental activism and worker protests were brutally repressed, especially in the neglected central region.

Following the 2014 revolution, Tunisia’s new social contract mandates improving the social inclusion of vulnerable areas, and the government has taken several steps to encourage transparency in health care coverage. A 2013 World Bank study of Tunisia’s program to provide Free Medical Assistance for the Poor (FMAP) was

conducted to assess the strengths, weakness, and opportunities for improvement in this health care sector. The poorest households are exempt from all medical fees, and vulnerable households receive health care at reduced fees. While the medical system, in general, would benefit from an increase in skilled nonmedical personnel, equipment, and information systems, the regional inequalities are found in the quantity and quality of health care. The doctor/patient ratios in the governorates of Tunis, Sfax, and Médenine (3.5 doctors per 1,000 patients) are equal to those of Denmark or Ireland and better than in the United States. But the number of doctors in the neglected, central governorates can be as low as 0.4 and 0.2 doctors per 1000 patients. In addition to formal external studies on how to improve health care equality and delivery conducted by organizations such as World Bank and the World Health Organization (WHO), Tunisia has also taken a people-centered approach to universal health care improvement by engaging citizens in the policy-making process through the Citizens' Jury for health (100 volunteers from a pool of 3,600); using evidence-based research, coupled with workshops, focus groups and town hall meetings, the jury gathered perspectives from cross-sections of people from all regions about how to reform the health care system (WHO 2014a).

Maternal Health

The minimum marriage age for Tunisian women and men is 18, but the mean age for marriage is 27 for women and 32 for men. Just over 98 percent of Tunisian mothers have one antenatal visit, and 85 percent have at least four antenatal visits. Around 99 percent give birth with a skilled attendant and deliver in an institutional setting. Tunisia has placed women's reproductive rights within the general framework of women's rights and gender equality. Around 65 percent of Tunisian women practice contraception. Women who work have a right to 67 percent of their salaries when on maternity leave. UNICEF reported Tunisia as having the highest exclusive breastfeeding rate in the MENA region, at 47 percent in 2000, but recent UNICEF reports state that the rate had fallen to 6.2 percent by 2010. Mothers have the right to breastfeeding breaks and separate space.

While maternal health care is accessible and affordable in Tunisia, the inequities between regions also have their impact on maternal health. While 75 percent of urban women have four antenatal visits, only 55 percent of rural

women do. The maternal mortality rate is 27.9/100,000 in the northeast region but rises to 37/100,000 in the northwest. The maternal mortality rate is more than three times higher in rural areas such as Kasserine (central west) than Sousse (central east/coastal). Studies indicate that 75 percent of maternal mortality was due to avoidable causes: monitoring, postnatal follow-up, and the like (Logan 2015).

Diseases and Disorders

While Tunisia has achieved remarkable results in communicable disease control, with measles, polio, and neonatal tetanus nearly eradicated, noncommunicable diseases such as respiratory and metabolic diseases and cancer are now the main sources of death. The highest cause of death among youth 15–20 years old is traffic injuries. While statistics are lacking about mental health disorders, concerns have been raised about stress, anxiety, violence, substance abuse, and depression, especially among youth. Tunisia introduced sex education in schools in the 1970s, but the courses targeted only baccalaureate students. In the 1980s, health clubs were introduced for secondary school students in general. While Tunisian youth are in general better informed about sexual and reproductive health and have more access to health care than many youth in other MENA countries, there are gaps in this coverage and differences in attitudes about discussing sexuality. HIV indigenous cases remain stable and low (1/100,000), and are concentrated in key populations, according to a 2014 WHO report, mainly men who have sex with men and injecting drug users. Tunisia is host to the International Conference on AIDS and STIs and has been recognized for its leadership role in responses to AIDs, ratifying the Arab Convention on HIV Prevention and Protection of the Rights of People Living with HIV—adopted in March 2012 by the Arab Parliament.

The primary users of tobacco in Tunisia are male, almost 50 percent of adult males as opposed to only 8 percent of adult females. Tunisia offers cessation programs, advertises the health risks on mass media, bans tobacco ads, and levies high taxes on tobacco. Tunisia has only recently begun banning smoking in a few public buildings (such as airports), but there are few smoke-free zones in Tunisia, monitoring them is minimal and health warnings on cigarette packages rare (WHO 2014a). Access to improved drinking water and sanitation are almost 100 percent in urban areas, but not in rural ones. Environmental pollution by state-owned industries, especially phosphate mines and

refineries, has been, according to some experts, the source of unusually high rates of cancer, infertility, and asthma.

Education

When the French left Tunisia in 1956, the illiteracy rate among Tunisians was 85 percent, with the majority of the literate being male. Between 1956 and 1960, 12,000 French public employees returned to France, and President Bourguiba was faced with substantial challenges in rebuilding institutions. His policy was to address human development first, focusing on education and poverty eradication along with women's rights and universal health care. With a poverty level at 33 percent for families in 1966, government resources were turned to supporting universal basic education and improvement of the basic conditions of life. In homes with no access to running water or electricity in a largely agricultural society, girls and women spent much of their time maintaining subsistence-level survival. Under the new plan, education was free and compulsory to age 16, and child labor was prohibited.

While the educational system has continued to improve each decade, with fewer students repeating academic years, more students transitioning from one level to the next, and girls achieving parity or better with boys at all levels, there remain inequities between regions of the country, between urban and rural areas, and between age groups. The 2015 estimate for the total literacy rate for men and women (15 years and older) is 81 percent, with 90 percent of men being literate and 75 percent of women. The relationship between the educational system and youth unemployment remains a concern as do teaching conditions and stagnating salaries for teachers at all levels (Boughzala 2013).

Primary, Secondary, and Postsecondary Education

Today more than 98 percent of boys and girls complete their primary education, and the universal primary education goal has been reached, with variables such as social environment, educational level of the mother, and class not being significant factors. After primary school, factors such as region, urban or rural, and male or female become significant. About 90 percent of males and females (with the female rate slightly higher) complete (junior) secondary school. Looking at the rates for high school and university education, 69 percent of males and close to 77 percent of females have reached these levels of education. Today, the literacy rate for youth aged 15–24 stands at 98

percent. Looking at how many students go on to enroll in high school and university, Tunisia finds a 21 percent difference between those from rural areas (59%) and those from urban ones (81%). In addition, cities in disadvantaged areas enroll considerably fewer students: Kasserine in the central west has 55 percent enrollment, and Tunis in the northeast has 81 percent going on to study.

Secondary school attendance in every region, except Sidi Bouzid on the central steppe, indicated that the number of girls equaled or exceeded the number of boys. The overall comparisons for the country (69% boys and 77% girls); rural areas (56% boys and 65% girls); and urban areas (76% boys and 85% girls) show that girls are more likely to stay in school than boys, but they tend to study humanities (73%) rather than technical sciences (20%). While girls have many courses of study open to them, that diversity is not reflected their employment opportunities (Gribaa and Depaoli 2014).

Job Training

Historically, there is a long tradition of apprenticeship between a *ma'alle*m (master) and *saana'* (apprentice) in the handicraft professions in the old sectors of several Tunisian cities. In the mid-1970s, a new government portfolio dedicated to professional training and employment was added to the government structure. Through numerous government adjustments (notably, the reforms of 2002, 2007, 2010, and 2013), job training is now administered at the ministerial level, separately from education, although both government ministries focus on improving the employability of their respective constituencies. During the first three decades after independence, the apprenticeship tradition was formally expanded into vocational programs to train skilled workers in new industrial fields, including automotive, textiles, welding, carpentry, HVAC, and other mechanical skills. For this, Tunisia invested heavily in vocational schools, with the assistance of several foreign aid programs from France, Switzerland, and the United States, as well as from some development banks. In the mid-1980s, the World Bank gave assistance to establish a nationwide network of two-year technical colleges called ISET. In addition, a network of schools for nursing and other health professions were established.

Job training takes place through a complex network of public, private, and international organizations. In the most recent reform (2013), the final report, titled *Réforme du dispositif national de la formation professionnelle*,

2014–2018 (Plan of Action for the Reform of the National Job Training System, 2014–2018), reveals the complexity of the job training system of the country. This report has a built-in structural problem: of the team of 11 experts who wrote it, only one was a woman. It acknowledges the participation of no fewer than 16 national public bodies as well as 5 international aid organizations. It also identifies serious deficiencies in the overall performance of this system, such as insufficient governance and lack of adequate needs assessments. It identifies 136 training institutions in 13 industry sectors run by the Training and Employment Ministry, 39 training schools run by the Ministry of Agriculture, 12 run by Defense, and 18 by Public Health, while the private sector has 930 full-fledged vocational education schools and 1,700 periodic training programs made available to private industry clients.

Although, there is no gender-based separation per se in education and training, job-training institutions tend to cater to different self-selecting groups of trainees. For example, in the textile industry, few males train to become seamstresses, and hardly any females train to become mechanics and welders. Mechanical and other construction skills are informally, by customary practice, exclusively male. This most recent reform seems to ignore the gender dimension, a major deficiency, given that the segment most affected by unemployment and lack of opportunity is woman, notably college graduates.

Adult Literacy Programs

There are two categories of adult literacy programs in Tunisia: 3-R basic literacy (age 15 and above “can read and write”) and special skills literacy postgraduation (New Technologies of Information and Communication (NTIC), English, etc.). Tunisia made great strides in the 3-R field in the first two decades after independence. However, adult education programs were abandoned or neglected in the 1980s under the pressures of the Structural Adjustment Plans pushed by the International Monetary Fund (IMF) and other international financial institutions. The 1992 session of the International “Education for Everyone” Conference took place in Tunisia. There was strong momentum to adopt a new strategy to improve literacy in Tunisia. Unlike Morocco, where civil society organizations took on most of these literacy programs, Tunisia used a top-down, government-controlled method. While conducting field research on literacy and gender in North Africa, the authors observed that close to 100 percent of the learners

were female in Southern Tunisia (field visits in Gabès and Tataouine Provinces, March 2002). National-level officers of the literacy program were majority male, while most teachers were female. In 2014, the national literacy rate was 79 percent, with a gender gap of about 17 points in favor of males. During the Ben Ali period, several skill enhancement programs were also launched, for example, the “21-21 Program” for postcollege training in English and computer skills—a laudable initiative seriously diminished by corrupt practices and fund misappropriation. Despite the difficulties, the 21-21 programs benefited substantial numbers of both males and females.

Employment

It is a symptom of the weakness of the Tunisian economy that most job reports talk about unemployment crises and failures to create opportunities. The weakness of the Tunisian economy has been the rising unemployment, mainly among the youth. The fall of Ben Ali in 2011 may be partially explained by the failures of his successive government teams to make a dent in the galloping unemployment figures, particularly among college graduates (unemployment rates higher than 40% in 2010). In conjunction with tax incentives and vocational education, several employment schemes were attempted without much success. In 2010, 61 percent of job seekers had been unemployed for more than three years. In the 15–25 age group, the unemployment rate was above 40 percent in 2011. The SIVP recruitment mechanism (*Stage d'Insertion à la Vie Professionnelle*)—a 12-month employment arrangement cofunded by industry and the public sector, had been set up by the Ben Ali government in early 2000 and continued after 2011.

Today, the postrevolution governments have not had much better success in creating more job opportunities. Tunisia is ranked 130th out of 142 in the *Gender Gap Report* (equal economic opportunity and empowerment). In 2012, the overall unemployment rate among women was nearly double that of men (24% to 14%). An additional problem is the unacknowledged, underpaid, and at times unsafe work done by women in the informal sector (agriculture, domestic help, etc.). Even when women are gainfully employed, they still are expected to do over 90 percent of the household tasks. Tunisia has a respectable maternity leave policy, but hidden obstacles are often thrown at women at the prime of their career potential when they start families at the same time. Sexual

harassment and violence have been identified as serious issues facing women in public transport, on job sites, and also in the domestic sphere. This gender inadequacy in employment in Tunisia is puzzling given the progressive gender laws instituted and recent amendments.

Family Life

After independence from France in 1956, and due to the institution of universal free education and of women's rights, the Tunisian family underwent rapid and radical transformation. Despite die-hard traditions in several pockets in hinterland Tunisia (often the head of the household is still the husband or father), the average family is nuclear and strives to sustain itself through dual income from salaried work. Article 234 of the Labor Code stipulates full equality under the law and calls for penalties for violations. Extended family networks are still strong today. Despite the transformation over the past two generations, traditional domestic roles persist. Women do most of the household work in addition to their jobs.

Premarital sex is common, but the law still may punish sex out of wedlock, as confirmed by a case in 2015 of a Tunisian woman and a German man arrested by the police at a hotel. Laws concerning marriage (still considered heterosexual), children born out of wedlock, orphans, inheritance of nationality, and children's rights developed in response to shifting historical conditions. For example, in the 1950s, in newly independent Tunisia and as an effort to check polygamy, children were required to have their fathers' name and to provide birth certificates to enter school, and children born out of wedlock had no civil status. Today, children can take their mother's name if she is a single parent, must take the father's name if he is known, and both mothers and fathers can pass national identity to their children. All parents, whether married or not, have the same responsibilities toward children and have civil status under the law. While prostitution is legal in Tunisia, sex trafficking is illegal, and sex tourism is discouraged.

Marriage is a major life event for most Tunisians, involving significant investments for the future spouses in preparing a home and showing evidence of ability to support a family. Most wedding celebrations last at least three days and involve entire neighborhoods. Many brides-to-be seek hymenoplasty (hymen restoration surgery) to become "virgins again" for their wedding night (*Al Arabiya News* 2014).

Despite progressive laws empowering women, conservative attitudes persist. Single women living alone are still a rarity in many places. To increase their chances of getting married and building a family, women are forced to yield to social pressure (Kelly and Breslin 2009). A woman's right to choose her husband is enshrined in the constitution. However, instances of parents' interference are frequent. Inheritance rights, still ruled by religious tradition, also play a role in the well-being of families. Women face legal and societal hurdles, including breaches of personal freedom, while struggling to fulfill their roles in society. Today, the divorce rate in Tunisia is the highest in the Arab world, and women initiate about half of them. Divorce is a legal and not a religious matter. Couples seeking divorce are required to meet three times with judges in an effort to encourage reconciliation. The high cost of divorce on the lives of children in this family-centered society is a major concern today. Social attitudes toward LGBT people are negative, and the Penal Code criminalizes sodomy (Article 230) and outrages to public decency (Article 226).

Politics

In 2009, women's representation in parliament was the highest in the Arab region (27.6%). Tunisia is the poster child of democratic transition and gender equality laws. It is true that the country shines when compared to failed experiments, such as Egypt's aborted democratic transition, and failed states, such as Libya, Syria, and Yemen, as well as when compared to the gender backwardness evident in Saudi Arabia and in several other Arab countries. After the two authoritarian periods of Bourguiba (benevolent, visionary) and Ben Ali (paranoid, corrupt), the new democratic regime instituted in January 2015 is full of promise, but it is too early to breathe a sigh of relief because the process is still far from a safe harbor of stability. In the first postrevolution elections (October 2011), the revolutionary High Commission succeeded in requiring party election lists for parliament to have gender parity. Decree 35, Article 16, of the 2011 Election Rules states, "Candidates shall file their candidacy applications on the basis of parity between men and women. . . . Lists shall be established in such a way as to alternate between men and women" (Dahlerup and Danielsson 2012).

In the fall of 2015, the dominant party (Nidaa Tunis) in the current government was severely damaged by a schism at the leadership level that led to the abrupt desertion of 32 members of parliament. In consequence, the

Islamist Ennahdha Party, which ranked second in the popular vote in the late 2014 elections, has become a de facto majority party, waiting in the wings for the further disintegration of its opponent. The current government has lost its mandate, and it is only a matter of time before it falls. In gender terms, that is not positive news. Ennahdha leadership has been quite astute by being flexible and by assuaging the fears of civil society activists over the perceived conflict, at times advocated by Ennahdha political literature, between religious edicts and the CSP Family Law. Currently, there is a risk that future Tunisian government coalitions, dominated by an Islamic party, might eventually lead to a backlash against gender equity through a revival of the concept of “complementarity” rather than equality between genders. The vigor with which civil society opposed such backlash in 2011–2013 is likely to be alive and well. It will continue to be a buffer against gender rights slippage. On the other hand, Tunisians will have to struggle much more in the coming years to secure a more gender-balanced participation in the political sphere.

Religious and Cultural Roles

Most women practice their religious rituals at home. All imams (Friday sermon and prayer leaders) are men. However, even before the 2011 revolution, an increasing number of women started going to mosques, particularly during Ramadhan *taraweeh* evening prayers. Islamic culture and practices in Tunisia resisted the puritanical push by the Salafi/Wahhabi movement in the late 18th and early 19th centuries. Thousands of *waly salih* (saint) *marabout* shrines dot the country, with some being led by female *hafidhs* (caretakers) who inherited their leadership roles from their male relatives (Dermenghem 1954.).

Today, Tunisian culture shows continued vigorous resistance to Wahhabism. After the revolution, the religious revival continued apace during the two-year transition led by the Islamic Ennahdha Party. After the coup d'état in Egypt in July 2013 forced the Muslim Brotherhood out of power, Ennahdha chose a tactical retrenchment in politics, gave up power voluntarily, and participated in a multiparty dialogue led by civil society arbiters—a process that led to a government of technocrats for about one year. Female circumcision is not practiced in Tunisia. Religious schools proliferated anew after 2011, but the trend was affected by the recent retrenchment of Ennahdha, the fight against terrorism that intensified after the 2013 political

assassinations, and the recent (2015) string of mass killings in Bardo, Sousse, and Tunis.

Tunisian society and culture are predominantly Muslim. Women's roles in religion are affected by enlightened innovations that would be frowned upon as illegal *bid'a* (a divisive trend) in more conservative societies. There is an ongoing conflict between patriarchal religious practices and the efforts of civil society to consolidate the empowerment of women and the protection of their rights. Early 20th-century Tunisian feminist Tahar Haddad studied religion at the famous Zaytuna mosque university, graduating in 1920 with a license to practice as a notary public. He based his 1930 book on women's rights on innovative arguments concerning the interpretation of Islamic texts for a modern society. Bourguiba's revolutionary attitudes toward women's empowerment are rooted in Haddad's arguments for women's rights in Islam.

The fact that the current minister of culture is a woman is more than tokenism. Tunisian women have had a substantial presence in cultural creation in all fields of creative arts.

Issues

Migration

A reflection of recent migration trends is the dearth of marriageable young men in certain regions of Tunisia. Very few young women choose to do *harga* (cross the ocean to Europe). In addition to the eligible males who do *harga*, with the help of criminal *passeurs*/traffickers, another substantial group of local eligible males use social media to hunt for spouses from abroad. Based on the authors' own observations of the use of social media by youth in the summer of 2015, an informal analysis of Facebook accounts of young males from the Tunisian hinterland shows a number of repeat features (modern-looking selfies, education and professional skill claims, and modern cultural statements) that are designed to appeal to European females. The demographics are skewed by these trends.

Tunisian youth seek to migrate mostly for economic reasons, but underpinning this economic migration is the double-standard that makes Tunisian currency nonconvertible; makes the visa process difficult, expensive, and humiliating; and continues colonial policies favoring the West in matters of finance, transportation, and goods and services long after the end of colonialism. Many Tunisian youth are extremely proud to be Tunisian, but they are frustrated at the lack of economic opportunity available

to them at home. Since the intensification of the crisis of the Syrian and other refugees in recent years, European target/host countries have adopted new measures to limit refugee status to people fleeing civil war. Tunisians had started joining those cohorts by traveling through Turkey. A certain number of Tunisian young women have chosen to travel to Syria to join their loved ones and other family relations in the civil war. Many more have fallen victim to human trafficking to the same and other destinations.

Violence against Women

Violence against women is another issue that concerns feminist activists in Tunisia. Legislation about and research regarding violence against women has lagged behind other forms of gender equality. The International Federation for Human Rights (FIDH) notes that it was only in 2010 that

Tunisia conducted the first national survey of violence against women. The official study found that 47 percent of women ages 18–64 had been subjected to at least one form of violence once in their lives, with little variation between urban and rural areas. At 31.7 percent, physical violence was the most common form of violence, followed by psychological violence at 28.9 percent and sexual violence at 15.7 percent. These figures raise a question: what explains the high rate of violence against women in a country considered a leader in women's rights? The answer is multifaceted. (FIDH 2014).

Under the dictatorship of Ben Ali, the discourse about women's rights was loud, but the reality of violence against women was, at best, ignored or, at worst, perpetrated by regime police and thugs. Feminist researchers continued to write about violence as a gender issue, but the state did little about it. While rape is a criminal offense (Article 227 of the Penal Code) as is sexual harassment (Article 226 bis, starting in 2004), FIDH notes that the Tunisian legislator “fails to define sexual violence in line with international standards and does not distinguish between public or private violence. The legislator is also silent on numerous types of violence, such as symbolic and economic violence.” FIDH points to Tunisian laws, based on religious or social mores, that actually reinforce rather than prevent gender violence, but it sees Tunisia as moving “from denial to dawning recognition” in the postrevolution period, citing the new Tunisian Constitution and the withdrawal of reservation about CEDAW as examples: “This is evidence of the importance

of civil society for promoting civic and democratic awareness and engaging in real time with every attempt to undermine women's rights. Tunisian civil society is a force for pressure and lobbying, as well as documenting, monitoring, and exposing violations of women's rights.” As a result, researchers consider Tunisia “the gift of civil society.”

U

United Arab Emirates

Overview of Country

The United Arab Emirates (UAE) is located between the countries of Oman and Saudi Arabia in the Middle East. The UAE is also bordered to the north by the Persian Gulf and to the east by the Gulf of Oman. The country is approximately 32,278 square miles (83,600 sq. km), and the entirety of this surface area is land. This total area includes an archipelago of about 2,278 square miles. Positioned to the east of the Arab world, the UAE is considered to be in a strategic location for the security and stability of the region as well as for the transit of the world's crude oil. As of midyear 2014, the United Nations estimates the total country population to be approximately 9,445,624, with more than 80 percent of the population consisting of immigrants (CIA 2016).

The United Arab Emirates is a federation of seven different states, or emirates: Abu Dhabi, Dubai, Sharjah, Ra's al-Khaimah, Umm al-Qaiwain, Ajman, and Fujairah. Six of these emirates officially combined to form the UAE on December 2, 1971, with Ra's al-Khaimah joining on February 10, 1972. Sheikh Zayed bin Sultan Al Nahyan was the nation's founder and first president; he is affectionately referred to as the "father of the United Arab Emirates." After his death on November 2, 2004, his eldest son, Sheikh Khalifa bin Zayed Al Nahyan, became president.

The Federal Supreme Council, made up of the rulers from each of the country's seven emirates, is the nation's highest executive and legislative body. These seven leaders choose the country's president and vice president. The president then chooses a prime minister and appoints a cabinet. The UAE also has a 40-member advisory body called the Federal National Council, half of which was elected for the first time in 2006. There are no political parties in the UAE.

The official religion of the UAE is Islam, and the majority of the UAE's population, approximately 76 percent, is Muslim. Six percent of the population is reported to be Christian, and 15 percent is declared as "other," primarily Hindu and Buddhist but also including Parsi, Baha'i, Druze, Sikh, Ahmadi, Ismaili, Dawoodi Bohra Muslim, and Jewish. Of the total population, only 15 percent of people are Emirati; 23 percent are other Arab or Iranian, 50 percent are South Asian, and 8 percent are other expatriates (CIA 2016). Arabic is the official language of the UAE.

The UAE has some of the largest oil and natural gas reserves in the world. According to the World Economic Forum, the UAE's estimated gross domestic product (GDP) in 2014 was approximately USD\$400 billion, a value indicative of the UAE's high global competitiveness. The UAE also offers free trade zones with zero taxes and 100 percent foreign ownership, which encourages foreign investment. The GDP growth rate was determined to be 4.6 percent in 2014 (CIA 2016).

In 2015, the UN Development Programme (UNDP) ranked the UAE 47th out of 188 nations based on the Gender Inequality Index (GII, 0.232). The GII considers achievement in reproductive health as assessed by maternal mortality and adolescent birth rates, female empowerment as assessed by the number of parliamentary seats held by women and women's attainment of secondary or higher education, and the labor market as assessed by its female participation. The UAE's ranking, the highest of all Arab nations, is thus indicative of very high human development in the country (UNDP 2015).

The role of women in Emirati society continues to develop and advance, as women in the country are represented in all components of society, including business, the military, and the government. In 2014, the UAE announced the opening of a regional office for UN Women in Abu Dhabi to review and promote the advancement of women in the nation. In 2014, the UAE also became the first country in the Arab region and the second country in the world to mandate women's appointment to the boards of all government institutions and companies. Women are given equal opportunity in education and employment, and more women than men are pursuing advanced education.

However, the UAE also faces several challenges involving women. One of these more common issues is sex trafficking, as the government works to fight and prevent an underground prostitution system operating in the country. Another issue migrant women in the UAE face is the abuse and exploitation of migrant workers. These challenges are connected to and, in some ways, stem from the lack of rights female domestic workers are given once recruited into the UAE. Conflicts involving domestic abuse and rape are also a current issue in the country, as is the ongoing struggle for women to compete with ever-heightening beauty standards.

Girls and Teens

Approximately 35 percent of the UAE's total population is under 24 years of age, with an approximate 1-to-1 boy/girl ratio under the age of 14 and a 1.5-to-1 ratio between ages 15 and 24. Based on 2005 estimates, the infant mortality rate is 10.59 deaths per 1,000 live births, with a lower female infant mortality rate than male. Out of 224 nations, the UAE's total infant mortality rate ranks 131st. The female life expectancy at birth (80 years) is approximately five years higher than men (CIA 2016). Girls are thus an

important and equally present part of Emirati youth. The recognition of teen girl's issues in the nation is also increasing. Teens Talk Middle East is the only established youth program working to empower and educate youths in the region. On October 18, 2014, this organization held a Teen Confidence Day for Girls in Dubai, teaching young women to love who they are and how to take care of themselves. The event was deemed a great success.

Extracurricular

Girls and teens in the UAE can engage in a multitude of extracurricular activities outside of the classroom; participation in sports such as tennis, karate, rugby, skateboarding, basketball, swimming, yoga, and many others is open to those who desire to join. For those girls looking to explore the arts, classes in theater, dance, painting, and music are also available. Girls and teens in the UAE can also enroll in cooking camps or kids' gyms. There are many clubs, teams, and classes for girls to explore in their free time.

Literacy

Although the literacy rate for both boys and girls has increased over time in the UAE, the female literacy rate has shown greater improvement. As of 2015, there are more literate women than men in the country. According to the UNESCO Institute for Statistics, in 1975, less than 40 percent of girls over age 15 were literate, compared to a literacy rate of approximately 60 percent for boys over 15. The youth literacy rate (ages 15–24) as compared between females and males leveled off around 2010, with both gender populations averaging rates of more than 90 percent. As of 2015, females over age 15 have a reported literacy rate of approximately 96 percent, compared to 93 percent for males. The increased literacy rate for girls in the UAE is reflected in the increased number of women pursuing higher education (UNESCO 2014).

Health

The UAE has a highly developed health care system. As the country has some of the best health care in the region, it is considered a designated medical tourism hub and has little need to send patients abroad for treatment. The health care system in the UAE developed significantly over a short amount of time. In 1971, when the federation was first established, the country had only 7 hospitals and 12 health

centers. In less than 50 years, the number of public and private hospitals in the UAE increased to more than 70, not including more than 150 established primary care health care centers and clinics. A number of regulatory authorities administer public health care in the country, such as the Ministry of Health, the Health Authority–Abu Dhabi, the Dubai Health Authority, and the Emirates Health Authority. Health care reformations in the country remain significant and ongoing.

Access to Health Care

All UAE citizens have socialized health care that is paid for by the government. Companies sponsoring residents of the UAE to work in the country are also required to provide employees and their dependents with health insurance. In 2006, Health Authority–Abu Dhabi mandated health insurance for all workers, covering almost 3 million people by 2013. The Dubai Health Authority also implemented insurance regulations for both residents and nationals (UAEInteract 2016). There are two free health care zones in Dubai. One is Dubai Healthcare City (DHCC), which was established in 2002. It has 2 hospitals, more than 120 medical centers and diagnostic laboratories, and more than 4,000 licensed medical professionals. The second is Dubai Biotechnology and Research Park, the world's first free zone dedicated to life sciences (Embassy 2015).

The UAE boasts first-class hospitals and has several partnerships with renowned global institutions. The Cleveland Clinic Abu Dhabi opened in 2015, with more than 80 percent of its physicians coming from the United States. Johns Hopkins Medical School is in affiliation with the UAE's Tawam Hospital, and the Susan G. Komen Breast Cancer Foundation works with the UAE government regarding breast cancer education (Embassy 2015).

Maternal Health

Prenatal and postnatal care in the UAE meet the standards of the world's most developed nations. The maternal mortality rate in the country is down to 6 deaths per every 100,000 live births. The total infant mortality rate is 10.59 deaths per 1,000 live births. The male infant mortality rate is 12.35 deaths per 1,000 live births, and the female infant mortality rate is 8.75 deaths per 1,000 live births. The UAE also averages a total fertility rate of 2.35 children born to every woman in the country. The current life expectancy for men is 74.67 years. Women's life expectancy in the UAE is higher than that of men's, averaged at 80.04 years (CIA 2016).

The UAE remains committed to protecting and improving the health of mothers and children both within the country and worldwide, particularly through the work of such organizations as the Supreme Council for Motherhood and Childhood, General Women's Union, and Family Development Foundation. In February 2015, Abu Dhabi hosted a meeting of representatives from UN agencies, governments, civil society, academia, and foundations to work on an updated Global Strategy for Women's, Newborn's, Children's, and Adolescent's Health. In a statement delivered at this meeting, Her Highness Sheikha Fatima bint Mubarak, an avid supporter of women's rights, stressed the need to provide for every woman and child in every setting, a cause recognized in the global initiative titled *Every Woman Every Child*. Her Royal Highness Princess Sarah Zeid is also a supporter of this initiative.

Diseases and Disorders

Although infectious diseases such as malaria, measles, and poliomyelitis were once prevalent in the UAE, they have since been eradicated. More than 90 percent of newborns are vaccinated, and vaccination campaigns are currently underway for chicken pox, pertussis, and rotavirus (Embassy 2015).

However, many women in the UAE today are facing a battle with obesity. The *CIA World Factbook* reveals that, as of 2016, 34.5 percent of the UAE's population was determined to be clinically obese. Moreover, according to the World Health Organization's (WHO) *World Health Statistics 2015* report, more females in the country are overweight than men; approximately 45 percent of women are overweight, compared to about 34 percent of men. Therefore, almost half of Emirati women are overweight, which is the seventh-highest ranking of obese women in the world. This makes Emirati women at greater risk of diseases such as heart disease, diabetes, stroke, and high blood pressure. Obesity in Emirati women is attributed to several factors, such as being more sedentary, having an indoor lifestyle, and having children at a younger age (WHO 2016).

Education

According to the UAE Embassy in Washington, D.C., the education system in the UAE is relatively new; in the 1950s, there were few official schools in the country. However, the UAE has made quick and vast improvements in

its education system, with approximately 1,200 established public and private schools as of 2015. Education remains a top government priority and is allocated a substantial portion of the federal budget each year. Government schools are free to UAE citizens; however, the majority of Emirati families choose to send their children to private schools. About 305,000 students attended 685 public schools during the 2013–2014 school year, whereas 605,000 students were sent to 489 private schools (UAEInteract 2016).

The education system in the UAE is composed of four levels: pre-primary, primary, secondary, and tertiary. The official school ages are typically divided as follows: children ages 4–5 make up the pre-primary school level, ages 6–10 are primary, 11–17 are secondary, and adults ages 18–22 make up the tertiary level. Emirati youth are required to attend school until grade 9; however, there have been talks by the government to require schooling until grade 12.

Pre-Primary, Primary, and Secondary Education

In 2014, the gross enrollment of children in pre-primary education was approximately 90 percent, with slightly more (about 1%) females than males. In 2014, the gross enrollment of children in primary education was approximately 106 percent, again with an average of 1 percent more female students than males. The primary to secondary transition rate in 2014 was approximately 100 percent for both boys and girls (UNESCO 2014). (Gross enrollment is the *total* number of students that make up a school level, regardless of age. Because the total number of students may include children outside of the typical age range, gross enrollment at a particular school level may exceed 100%.)

The UAE Ministry of Education is also working on a plan called Education 2020 to reform and improve the education system, which entails better preparation, greater accountability, higher standards, and improved professionalism. Education reform in the UAE includes the implementation of e-learning in the classroom, with the objective to provide every student with a smart tablet and access to high-speed 4G networks by 2017. Health education workshops are also being developed to promote the awareness and skills necessary for children to lead healthy lifestyles (UAEInteract 2016).

Tertiary Education and Job Training

According to UNESCO, in 2014, the gross enrollment in higher education in the UAE was approximately 22 percent. Of the students enrolled in tertiary education

institutions, female students substantially outnumber the males; UNESCO reports approximately 35 percent female gross enrollment as opposed to about 15 percent male gross enrollment (2014). Women account for about 72 percent of the student population in public tertiary institutions, and about 50 percent in private tertiary institutions (Embassy 2015).

There are a number of both private and public institutions for higher education in the UAE. Some public universities include UAE University, in which women make up 79 percent of the student body; Zayed University, which began as an all-women's institution that later expanded to include men; and Higher Colleges of Technology, the largest university in the country. Some of the UAE's private institutions include the American Universities of Sharjah and Dubai, which are both accredited in the United States; Sharjah University; and Abu Dhabi University.

There are also a number of vocational and technical education centers in the UAE. Students may receive training for a variety of different careers at these institutions, which include the Petroleum Institute, the Dubai School of Government, the Emirates Institute for Banking and Finance, and the Emirates Aviation College for Aerospace and Academic Studies.

Special Education

The UAE is also making strides in attending to the needs of special needs students. In 2008, the Ministry of Education established the Department of Special Education. A partnership was also formed between the government of Abu Dhabi and the New England Care Center for children to both establish an education program for special needs students as well as to train UAE nationals to provide these services in Arabic. Noteworthy measures are also being taken to integrate special needs students into the mainstream education system; there are 114 integrated education schools in the country equipped with assistive technologies to cater to the needs of special needs students.

Employment

The UAE government endeavors to provide women the opportunities to work indiscriminately in all occupations and professional levels. The Constitution of the UAE guarantees women the rights not only to practice the same professions as men, but to receive an education and to inherit property. However, overall female employment in

the nation does not reflect women's accomplishments in education, particularly in the private sector. According to statistics supported by the UAE National Media Council, women over age 15 account for only about 47 percent of the labor force, whereas men consist of 91 percent. This difference, however, is attributed more to personal choices, employment conditions, and cultural norms than government policy (UAEInteract 2016).

Jobs and Careers

Women's occupation of the labor force is particularly evident in the public sector. Many women are in the public-sector workforce. Emirati women work in all sorts of employment settings, including, but certainly not limited to, engineering, science, health care, media, computer technology, renewable and nuclear energy, the oil industry, and commerce. Women also serve in the armed forces, customs, and police. Emirati women can similarly be seen competing in high-level sports both at home and internationally.

Moreover, women are able to ascend to higher positions. Four women in the armed forces work as fighter pilots, and 30 more are with the country's special security forces. As of 2016, 8 women work in the UAE cabinet, which is 2 more women than the cabinet of the United States. Seven women work for the Federal National Council, accounting for 20 percent of the council's total body. Also, in 2015, Dr. Amal Al Qubaisi became president of the Federal National Council, the first woman to head a national assembly in the region. Four women have been appointed as judges for the UAE court system. Two women have been appointed as public prosecutors, 17 as assistant public prosecutors and marriage officials, and one as a marriage registrar. Furthermore, women occupy 20 percent of the country's diplomatic corps positions, including several female ambassadors. Thirty percent of women working in the public sector are in senior positions, and more than 14,000 UAE businesswomen run approximately 20,000 private companies (Embassy 2015).

Labor Regulations and Pay Equity

Her Highness Sheikha Fatima bint Mubarak has recently launched the Strategy for the Empowerment of Emirati Women 2015–2021, which focuses on empowering women in education, health, the economy, lawmaking, the environment, the social domain, information, political participation, and decision making. The UAE also acceded to the Convention for the Elimination of All Forms of

Discrimination against Women (CEDAW) in 2014 and signed all international treaties that work to protect women's rights, such as the Child Protection Convention, the Hours of Work (Industry) Convention, the Equal Remuneration Convention, and the Convention Concerning Night Work of Women Employed in Industry. According to a CEDAW report on the UAE from July 2014, the UAE has increased women's labor force participation rates by passing flexible human resource laws, thus allowing women to reconcile their commitments to family and employment. Wives and daughters of sponsored male residents in the UAE are also eligible to obtain work permits. Moreover, as of the 2014 CEDAW report, there were 38 government enterprises providing child care for mothers at their places of work (CEDAW 2014).

Under Article 32 of the Labor Law, women in the UAE are guaranteed the same wages as men for equal work. Pay equality for men and women in the UAE by law is applied to bonuses, allowances, and severance pay. Women are also granted the right to fully paid maternity leave. In 2008, the Ministry of Labor formed the initiative to establish a Wage Protection Office. After studying the records from the office, CEDAW reports zero observed or recorded cases of wage inequality or discrimination. The Ministry of Labor has also established nine labor offices in areas of the country with the highest concentration of foreign workers to resolve any labor disputes between employers and workers.

In 2010, the Federal Authority for Government Human Resources formed the Committee for Women Working in the Federal Government. This committee studies and provides for the needs of the women who work for the federal government and analyzes regulations and legislation regarding all women's affairs. Furthermore, the committee works to raise awareness of the importance of women in the nation, proposes initiatives to support working women, and promotes the establishment of women's committees for female workers in government institutions and authorities (CEDAW 2014).

Family Life

Islam permits a man to marry up to four wives as long as he is able to treat each wife equally. However, polygamous marriages have become much less common in the UAE. The family structure and gender roles of Emirati society are changing. Young women are becoming more focused on education and career than marriage and children.

Given the high number of foreigners in the country, men are often marrying non-Emirati women. A cultural shift between tradition and modernism can thus be observed within the country.

Family Structure and Gender Roles

The majority of Emirati households are made up of nuclear families, meaning a couple and their dependent children. However, with divorce becoming more commonplace, single-parent households are also becoming more of a cultural norm. In the past, marriage in a young woman's mid to late teen years was common. However, in recent years, it has become more popular for Emiratis to finish high school and even college before contemplating marriage. Emiratis are permitted to marry whomever they choose, but arranged marriages by family are still common. Because marriages are arranged, families often start the search for potential marriage mates within the extended family before searching elsewhere. It is a cultural norm for people to marry their first cousins in the UAE. However, due to an increase of children being born with birth defects, the country is encouraging genetic testing before family members marry.

Children are an essential part of an Emirati marriage. A marriage is considered incomplete without children. In years past, Emirati families were very large; however, today many women are choosing to have fewer children. By attending college or joining the workforce, some women have chosen to delay having children or have limited the size of their family so that they may pursue both motherhood and a career. Also, the majority of Emirati families have live-in nannies to help with child care. According to the World Health Organization (WHO), 20 years ago, Emirati women had an average of approximately six children per woman; as of 2015, this average has fallen to two children per woman.

Emirati households have commonly had strict gender roles. Women are often seen as the caretakers of the home and of the children. Men serve as the financial providers and are required to materially provide for the family. Emirati women also generally seek their husband's and family's approval to work outside of the home.

Divorce

The UAE has the highest divorce rate in the country's region, and the number of divorces in the country is increasing every year. Many factors are said to be attributed to the

rising divorce rate, such as lack of communication, infidelity, financial hardship, and religious or cultural differences.

The most common types of divorce are *talaq* and *khula*. The *talaq* divorce is initiated by the husband, in which he must say to the wife, "I divorce you," three times. A *talaq* divorce may also be initiated by the husband via text message, e-mail, phone call, or letter. A woman, however, may not initiate a *talaq* divorce; a wife may seek a divorce called *khula*. In a *khula* divorce, a wife must return to her husband all of the dowry and gifts given to her upon her marriage; the *khula* divorce is difficult for women because it may impose financial hardships on them, particularly the ones who do not have jobs. A woman can also seek a divorce from the courts based on factors such as alcoholism or abuse.

Also, it is important to note that joint custody of children does not occur in the UAE. If a divorce occurs, the custody of any young children goes to the mother, and the father is assigned a role as guardian. If the mother should remarry, custody is lost and transferred to her female next of kin. When a boy reaches around age 8 and a girl around age 13, custody may be transferred to the father or the father's family. Furthermore, a divorced mother cannot leave the country with her child without permission from the child's father, even if she holds custody. The father is also entitled to put a stop order on the mother and child to ensure this does not happen.

Politics

In the UAE, women are playing an active role in both the formulation of government and law as well as its execution. The current political climate of the country is indicative of substantial change and progress for women since the country's formulation in 1971. As discussed above, women serve in the UAE cabinet and work as judges, ambassadors, and public prosecutors as well as make up approximately 20 percent of the Federal National Council. The significant progress being made in terms of women's rights becomes particularly apparent when considering that women in the UAE were only granted the right to vote as recently as 2006. Only 10 years later, women are serving acting roles in government and politics, making the UAE one of the region's pioneers in women's progress.

However, in comparison to women's rights that are being advanced worldwide, the UAE is also found lacking in certain freedoms. Same-sex relationships in the UAE are illegal and punishable by flogging, jail time, and

deportation. Also, outside of certain free media zones in Dubai, Abu Dhabi, and Ra's al-Khaimah, the government regulates and censors all aspects of the media. Freedom of speech continues to be an ongoing struggle for citizens, residents, and journalists. Any criticism of the government is punishable by jail.

Judicial System

The Constitution of the UAE gives independence to the judicial branch of the government. In the UAE, all emirates are part of the federal judicial structure except Dubai and Ra's al-Khaimah, which have their own court structures. The Supreme Court consists of five judges appointed by the Supreme Council. There are three main branches within the country's court structure: civil, criminal, and sharia, or Islamic, law.

Women's Associations, Nongovernmental Organizations (NGOs), and Nonprofits

In 2015, the Gender Balance Council, a federal body designed to increase the role of women in leadership positions, was established. Organizations that monitor and promote the advancement of women's issues, such as rights, labor, and education, are often headed by Her Highness Sheikha Fatima bint Mubarak, who is the president of the Supreme Council for Motherhood and Childhood, chairwoman of the General Women's Union, and supreme president of the Family Development Council.

The General Women's Union was first established in 1975, four years after the formation of the UAE. This organization is accredited with support for women's education, literacy, and health, including playing a large role with a globally competitive increased life expectancy rate for women, decreased mortality rate during childbirth, and assistance by a professional at all births in the country.

Other organizations promoting women's equality include the Dubai Women Establishment (DWE), which is headed by Her Highness Sheikha Manal bint Mohammed bin Rashid Al Maktoum. DWE aims to create opportunities for women to contribute to the nation's development and progress, such as the launch of a UAE Women Leadership Programme to train potential Emirati women to become leaders.

However, according to findings from Freedom House, a U.S.-funded NGO that monitors global democracy, political freedom, and human rights, women in the UAE may face certain challenges in the establishment of their

organizations by only being allowed to participate in state-sanctioned feminism. Freedom House reports difficult restrictions, regulations, and censorship during and after the establishment of NGOs in the UAE, which also must first be registered with the Ministry of Social Affairs.

Religious and Cultural Roles

Islam is the official religion of the UAE. Islam has five pillars, or requirements: (1) faith, acknowledge that there is one God and his Prophet is Muhammad; (2) prayer, pray five times a day; (3) charity, giving to the needy; (4) fasting, observe the holy month of Ramadan; and (5) hajj, make a pilgrimage to Mecca once in one's life, if financially and physically able.

There are two main schools of thought in Islam, Sunni and Shia. Most UAE citizens are Sunni, with a small percentage being Shia. Muslims worship at local mosques. In an effort to prevent Islamist extremism, the UAE government regulates all mosques. The government reviews the weekly *khutbah* (sermon), and each mosque gives the same khutbah at the Friday prayers.

Religious Laws

The UAE is governed by sharia (Islamic) law. There is no separation of religion and state. Sex outside of marriage, prostitution, and adultery are all punishable by flogging and jail time. Among the requirements of Islam are an abstinence from alcohol and pork and an adherence to modest dress. In the UAE, pork can be purchased by non-Muslims. Liquor can also be purchased by non-Muslims at a liquor store with a liquor license or at hotels. There is no mandated dress code for Muslim men or women in the UAE, although respectful and modest dress is expected. Emirati men traditionally wear a *kandura* (long white robe) and a *keffiyeh* (type of headscarf). In public, Emirati women traditionally wear a black *abaya* (long robe) and *shayla* (type of headscarf). Some women also wear a niqab, which covers the nose and mouth, leaving only the eyes exposed.

The UAE is very tolerant of other religions, and the government has donated land to religious groups to build their places of worship. However, proselytization of non-Islamic beliefs is illegal. It is also illegal for Muslims to convert to another religion. Muslims may marry non-Muslims, but they may not change their faith. An Emirati's religious beliefs are noted on their passport and all legal documents. Aside from these restrictions, the UAE government

is tolerant to most religious beliefs; however, any religious or spiritual practices they deem as black magic or sorcery are punishable by jail and deportation.

Women's Roles

The role of women in Islam is interpreted differently from culture to culture, and many women face restrictions and oppression in the name of Islam. However, the Koran, the religious text of Islam, advocates equality between men and women, which the UAE is working to uphold. In the UAE, the role of women in Islam is recognized and celebrated with events, such as a 16-day program that culminated on International Women's Day in March 2013. Islamic Emirati women are also seen as important tools in combating terrorism. In 2014, the UAE hosted a panel discussion on "The Role of Women in Countering Violent Extremism," which recognized the equality of women and men as well as the need for women to successfully combat terrorism. This includes women's contributions on a business level, helping to develop strategies to combat extremism, and embodying a positive image of Islam at home for their families and communities.

Issues

Domestic Violence, Sexual Assault, and Rape

Rape and domestic violence are an ongoing human rights issue in the UAE. Though UAE law criminalizes rape, which is punishable by death under the penal code, spousal rape is not recognized. Furthermore, those women raped by persons other than their spouses are faced with being charged for consensual sex outside of marriage, which carries a penalty of flogging, jail, and possible deportation, not to mention social stigma from family and community members. Due to the severe consequences of reporting rape, many women choose to suffer in silence, leading to a low report rate. Foreign workers, particularly those who are employed as domestic help, are at high risk for sexual assault because they often have the least access to resources and help. If migrant workers are able to report a sexual assault, the case often never goes to court and has a very low conviction rate for perpetrators when it does. In sharia court, rape is very difficult to prove.

Domestic abuse is also highly underreported. According to the 2015 World Report conducted by Human Rights Watch (HRW), Article 53 of the UAE's Penal Code gives

men the right to use physical violence as discipline for the women and children in their family as long as the abuse does not cross the limits dictated by sharia law, such as not leaving physical marks.

Victims of domestic abuse may file complaints with the police units located at public hospitals. Public hospitals and police stations also provide social workers and counselors, usually female, for women to talk to. The UAE also has domestic abuse centers in Abu Dhabi, Dubai, Ra's al-Khaimah, and Sharjah. There is also a national hotline to report domestic abuse. However, women often feel uncomfortable or unsafe reporting the abuse for social, cultural, and economic reasons. The UAE government is currently working to raise awareness about domestic abuse via seminars, programs, conferences, and the like.

Furthermore, sexual relations outside of marriage is illegal, and bearing a child out of wedlock is punishable by imprisonment and deportation. Abortion is also not permitted in the UAE, with exceptions for when pregnancy endangers the life of the mother. Female genital cutting (FGC) is very rare, largely seen in foreign residents, and is prohibited in hospitals and clinics by the Ministry of Health.

Trafficking and Prostitution

The U.S. Department of State ranked the UAE as a Tier 2 country in its *Trafficking in Persons Report 2015*, a level that describes countries "whose governments do not fully comply with the TVPA's [Trafficking Victim Protection Act's] minimum standards, but are making significant efforts to bring themselves into compliance with those standards" (UNHRC 2013).

Part of the trafficking operation in the UAE functions by misleading women from around the world to come to the country thinking they are going to be offered employment in positions that include salespersons, domestic workers, hotel receptionists, waitresses, and beauticians. They are then subjected to passport-withholding, threats, and physical or sexual abuse. It is difficult for such victims to escape, as they often do not have the funds and are accompanied and watched at all times. It has been reported that more vulnerable women are often targeted for sexual trafficking, such as those who are younger or who have disabilities (UNHRC 2013).

The government of the UAE takes the practice of sexual trafficking very seriously, and it is implementing new measures to prevent its occurrence. CEDAW's 2014 report

discusses several ways prevention and awareness of sexual trafficking and prostitution are occurring in the UAE. For one, federal law mandates punishment of traffickers, particularly those who traffic women and children. This law was amended in 2012 to provide even greater protection for victims. The National Committee to Combat Human Trafficking has also developed a four-part strategy to address this issue, which entails protection and prevention, prosecution and punishment, the strengthening of international cooperation, and protection of the victims. The committee also launched a media campaign at several airports in the UAE to strengthen awareness and prevention of this issue. The government has established five shelters in Abu Dhabi, Dubai, Sharjah, and Ra's al-Khaimah that provide psychological, social, health, legal, and rehabilitation services to victims as well as follow-up services and hotlines.

Domestic and Migrant Labor

As noted, the majority of the UAE's population consists of migrant workers. The United Arab Emirates has no required minimum wage for employees, making human exploitation a problem in the country. The average construction worker or domestic helper can make as little as USD\$200 per month. Many workers come from Southeast Asia to work as domestic help in Emirati homes, including gardeners, nannies, cooks, and drivers. Domestic workers are predominantly female. They often work seven days a week with no set days off and do not have scheduled breaks throughout the day. Some suffer from physical abuse, confinement, and confiscation of their passports. They may be denied basic rights, such as decent food, living conditions, or medical treatment. Some domestic helpers have reported that their wages were not paid to them. There have also been reports of domestic workers being subjected to forced labor or trafficking. In 2014, a standard contract for domestic labor was issued to combat this problem. This contract mandates a minimum of eight hours of rest for the domestic worker per day as well as days off per week. However, domestic workers are still not covered under labor law (HRW 2015).

Workers from Pakistan and neighboring countries are often employed in construction and are forced to work outside in the extreme temperatures of the country. In recent years, the UAE government has restricted outside labor when the temperature is 122°F (50°C) or higher, limited outside summer working hours, and imposed mandatory

breaks. However, many workers can still be seen working in extreme heat throughout the summer.

Furthermore, should workers face such abuse and exploitation, it is very difficult for them to change employers in the UAE. Most workers are strongly dependent on their employers via the *kafala* sponsorship system, which operates in all Gulf Cooperation Council states. Through this system, employers have the right to revoke a worker's sponsorship at any time, which would in turn revoke his or her right to remain in the country. Though some migrant workers covered under labor law may be able to change employers in special cases, domestic workers, whom these laws do not protect, cannot change employers before their contract ends or the employer gives his or her consent (HRW 2015). Therefore, despite efforts made by the UAE government, the abuse of migrant labor is still a big issue in the country.

Beauty Standards

Social constructions of beauty in the UAE have been heavily influenced by Western media, and beauty standards in the country have been set very high. Body image issues have been a popular topic in the UAE media, as both adult and young women struggle with eating disorders and self-esteem. The beauty and cosmetics market is flourishing as women in the UAE strive to fulfill these high standards, and the consumption of cosmetics and perfume ranks globally among the highest per capita (*Al Bawaba* 2008). Plastic surgery has also become very commonplace in the country; the UAE has become a medical tourism hub for plastic surgery, with people from all over the Middle East flocking to the UAE for various cosmetic procedures. The plastic surgery procedures that can be done in the UAE include, but are certainly not limited to, breast augmentation, liposuction, rhinoplasty, vaginoplasty, and hymen replacement. Laser hair removal and professional skin bleaching have also become very common among Emirati women.

Z

Zimbabwe

Overview of Country

Zimbabwe is a landlocked country located between the Limpopo and Zambezi Rivers in southern Africa. It borders South Africa to the south, Botswana to the west, Namibia to the northwest (through the Caprivi Strip), Zambia to the north, and Mozambique to the east. It has a surface area of approximately 149,305 square miles (386,700 sq. km); about 1 percent of it is water bodies (lakes and dams), and 20 percent is low-lying, below 2,952 feet (900 meters) above sea level. Zimbabwe's topography is defined by a mineral-rich plateau, also called "the watershed," which transverses the country, running diagonally from the southwest to the northeast of the country. The plateau defines major river systems and also influences climate. Its higher elevation is comparatively cooler, malaria and tsetse fly free; hence, it attracted colonial settlers who established urban settlements at intervals along the plateau. Major towns and cities are Bulawayo, Gweru, Kwekwe, Harare (the capital), and Mutare, and they are connected by roads, railways, the electricity grid, and telephone networks. With the exception of tourist resorts, the low-lying areas are economically less developed and constitute rural areas. They receive comparatively less rain.

Zimbabwe's population is estimated at 13.7 million; 33 percent live in urban areas and the rest in rural areas.

The population density is sparse at about 100 persons per square mile. Forty percent of the population is younger than 15 years of age, and 91 percent of youth are literate (World Bank 2014; ZimStat 2012). Zimbabwe has 16 official languages, including English; Shona is the most commonly spoken language.

According to the UN Human Development Index (HDI) for 2015, Zimbabwe is classified as a low HDI country and is ranked 155th, between Mauretania and Madagascar. As will be discussed, since 1990, poverty and social inequality are increasing, while access to social services has been declining considerably, with negative effects on women and girls.

Education

Zimbabwe's education system comprises seven years of primary school with an exam at the end of the seventh year. Some schools use primary school exam results to allocate places for secondary education. Secondary school has two phases. The first four years lead to an examination called the General Certificate in Education (GCE), or Ordinary Level (O Level). Students must pass five subjects, including mathematics and English language, with a C or better to be considered to have a full certificate. Successful students can proceed to Advanced Level, a preuniversity two-year course in which students choose three to four related subjects in science, humanities, or business subjects. The choice of subjects influences the choice of degree

at the university or other post-high school training. Officially, there is automatic promotion from primary school to the fourth year of secondary school. However, some school administrations select students on merit by using school exam results; others set their own tests to assess students' language, numeracy, and mathematical skills.

Girls' Performance in Primary and Secondary Education

Zimbabwe has had universal primary education (UPE) since 1980. In the first decade, primary education was free. When Zimbabwe adopted neoliberal market reforms in 1990, legislative changes making fees compulsory were triggered. By 1990, there was near parity in girls' and boys' enrollments in primary school (CSO 1998, 22). When one follows a cohort through primary school, more girls dropped out. For example, in 1990, there were 194,700 boys and 192,900 girls in grade 1; by 1996, when they reached grade 7, there were 162,931 boys and 157,235 girls (CSO 1998). Thus, girls' primary school completion rates were comparatively lower than those of boys. In the first four years of secondary school, girls' enrollments were 43–47 percent between 1990 and 2000 (CSO 1998, 34). In the two years of preuniversity courses, girls' enrollments went down to 30–43 percent, with considerable differences between the first year and second year of the courses (CSO 1998). Girls dropped out of school because they lacked resources; were needed for domestic chores, including caring for siblings and sick relatives; or had become pregnant.

Because of patrilineal descent, in which resources are accessed and inherited through males (father to son, brother to brother), with women benefiting as dependent relatives (wives, daughters, mothers), when poor families are forced to choose between spending on daughters' or sons' education, many opt to educate the boys. Girls are expected to marry into other families. Thus, educating girls is tantamount to dispersing limited resources and potentially enriching other families, while spending on boys is an investment with future returns, thereby concentrating resources within the lineage/family. Over the years, there have been many campaigns to improve girls' access to secondary and higher education. However, in a fee-paying dispensation where poverty is endemic, these arguments remain stubborn.

Tertiary Education

Between 1990 and 2000, female students constituted a third of university enrollments at the oldest university

(University of Zimbabwe) and had much lower enrollment at newer state-funded and private universities whose statistics were submitted to the statistics office. In technical colleges, a third of enrollments are female (CSO 1998, 47). In nursing colleges, females dominate, and in teachers' colleges, the enrollment of females increased through the 1990s to outnumber males in 2000, when it reached 54 percent (47). In general, the comparatively low female enrollments are influenced by secondary school completion rates. Until the conspicuous girls' attrition rates are dealt with, it will not be easy to reach parity in tertiary enrollments. Furthermore, tertiary education enrollments point to gender biases in the professions, with women funneled into care-related work such as nursing and teaching (in primary and secondary school). In Zimbabwe today, these professions are characterized by wages below the poverty line of USD\$500 per month for a household of five (ZimStat 2015).

Sex Education

Sex education was controversially introduced in 1993 in response to HIV/AIDS and the especially high prevalence rates among youths. Controversy emanated from "cultural sensitivities" and concerns about how much detail about sex should be in the curriculum. However, conservative funding and international gag rules on comprehensive sexuality education, especially under U.S. President George W. Bush's administration, bolstered this stance. Consequently, sex education has been restricted to abstinence-only messages, making it impossible to discuss contraceptives and details of sex and sexuality. This apparently complies with prevailing cultural and religious sensitivities—a convergence of both Christianity and African beliefs.

These cultural sensitivities have fanned several cycles of moral panics whenever organizations that advocate for HIV prevention suggest making condoms available to teens through the schools. Teachers resist comprehensive sexuality education because it is perceived as diminishing their respectability as professionals and as adults. Still, the abstinence-only curriculum lacks teaching aids, teachers lack support and training in the subject, and in many schools, it is marginalized and treated as an extracurricular activity. Abstinence-only sexuality education has merely produced distortions in information and not done much to empower young women about reproductive health or to reduce teen pregnancy. For instance, the Zimbabwe

Department of Health Services (ZDHS) 2010–2011 shows that 24 percent of 15- to 19-year-olds were either pregnant or had had a baby (ZimStat and ICF International 2012, 67) at the time of the survey. Rural teens are more likely to become pregnant than urban teens. The rural-urban divide shows inequities—in access to information and technologies—borne by many poor teens.

The average age of sexual debut is 18 years, but it is lower in rural areas (ZimStat and ICF International 2012). This clearly points to the fact that teenagers are having sex but yet are denied access to information and technologies to manage the outcomes of sex.

Teenage girls who get pregnant suffer at the hands of their relatives who force them, by chasing them from home, to declare their partners or browbeat them into marriage to restore family honor. Becoming pregnant outside of wedlock brings shame to the family. Thus, many young women suffer humiliation repeatedly from not being allowed to control their reproduction through denial of access to full information and to contraceptives and then being blamed for outcomes of unprotected sex, such as out-of-wedlock childbirth. If their partners evade paternal responsibilities (including marriage and child maintenance), the young women have to care for their babies. Such pregnancies reduce chances for marriage in the future because the young women are seen as untrustworthy.

Teen pregnancy also often entails dropping out of school. This prejudices future employment opportunities, thus locking young women into low-income and insecure employment, such as in the informal sector, and susceptible to hand-to-mouth existences. Clearly, adolescents' access to full information and to contraceptive technologies is strategic for women's well-being, empowerment, and gender equity.

Health

Access to Health Care

As a low-income country, Zimbabwe has faced challenges of equitable access to health care despite commitments to principles of equity. Health insurance is virtually nonexistent. Less than 1 percent of the population (those in formal wage work) is covered (Osika et al. 2010). There are various service providers of health care, including the government, Christian missionaries, mines, companies, local authorities, and private for-profit facilities. However, the persistence of urban bias in the distribution of available financial, material, and human resources when more

people live in rural areas skews access. This bias has implications for women's access to health care because more women live in rural areas, and high staff turnover during economic crises affect remote rural areas more.

In 2010, the Ministry of Health observed that only 33 percent of villages had access to ideal health care facilities: a clinic with two nurses (including one with midwifery qualifications) (Osika et al. 2010). Furthermore, there was a nationwide shortfall of community-level auxiliary staff trained in basic knowledge about malaria prophylaxis, family planning (and distribute prophylactics), and health promotion. With the emergency of HIV/AIDS, home-based caregivers (HBCs) also emerged as another category of auxiliaries. In most instances, the latter are volunteers, while other volunteers receive some remuneration.

Rural areas have to contend with long distances to facilities; most people walk more than 10 kilometers to the nearest facility (about two hours). These conditions impede health-seeking behavior. Resources permitting (availability of vehicles, fuel, and staff), mobile clinics are provided for voluntary counseling and testing (VCT) for HIV and AIDS, child immunization, and antenatal care. In this regard, The Ministry of Health and Child Welfare (MOHCW 2010, 11) notes that, in 2010, 58 percent of villages had access to a static or mobile VCT, and 60 percent had access to child immunization services and antenatal care. Treatment in rural and local authority facilities is free. Urban clinics have a nominal fee of USD\$5. Still, some families cannot afford it. For maternity care, higher fees and registration in advance are expected. Often, there are baby care provisions that women are expected to bring, such as clothes, blankets, and, increasingly, disposable diapers. Home deliveries happen at the hands of birth attendants with uncertified training and experience.

Clearly, this is far from universal access to health care, even at such a primary level. Indeed, by 2010, the MOHCW acknowledged that Zimbabwe was not going to meet the Millennium Development Goals (MDGs) in 2014, as health indicators show. Child malnutrition is 11.2 percent. Child mortality rates for children under the age of five is 80 per 1,000 live births, and the maternal mortality rate is 470 per 100,000 births (World Bank 2014).

Women and children continue to be vulnerable to preventable conditions and diseases because of growing poverty that precludes their ability to pay for health care. HIV deaths, 39,000 per year according to UNAIDS, show that access to antiretroviral drugs (ARVs) is not yet universal (2014).

Staff Shortages

Despite policy commitments to equity, access to health is also compromised by staff shortages because of poor working conditions (relatively low remuneration, lack of equipment and facilities in institutions, staff shortages leading to work pressure), especially since the 1990s. These conditions led to nurses and doctors immigrating to neighboring countries as well as the English-speaking global north. Where there are professionals still in Zimbabwe, distribution of staff does not follow population needs. Qualified professionals are mostly concentrated in urban areas where higher-tier facilities are located.

Reproductive Health Rights

Zimbabwe participated in both the International Conference on Population and Development (ICPD) held in Cairo, Egypt, in 1994 and the Fourth UN Women's Conference in Beijing, China, in 1995, from which the global women's movement sharpened focus on human rights approaches to women's issues, including health. These conferences highlighted the need to respect women's bodily integrity and to allow autonomy in decision making on matters involving sex, sexuality, sexual orientation, reproductive wellness, information, access to treatment, and whether and when to have children. However, the translation of these principles into policies is a veritable challenge across much of sub-Saharan Africa. Researchers point to challenges with human rights perspectives' assumption about "the individual" as bearers of rights, autonomous and capable of making decisions based on self-interest. In reality, relationships and propriety emphasize intersubjective connections between people.

In other words, decisions to have or not have sex are not as personal as one might wish. They are connected to social obligations and are socioculturally situated. Thus, in Zimbabwe, notions of "cultural sensitivity" have been deployed to determine who can have access to which reproductive technologies and for what reasons. In general, access by single women is despised, especially because, ideally, sex is best had within heterosexual marital unions. Outside of such unions, sex remains illicit. Likewise, reproductive and sexual health concerns of menopausal women fall into a policy blind spot.

Contraceptive Use

In the colonial era, contraception was viewed negatively as a racist ploy to limit population growth among Africans,

a means to undermine African culture, and a male prerogative to control women's sexuality and fertility. These arguments are echoed in an ethnographic study of a rural district in 1989–1990 (Chikovore et al. 2002), which found that men were anxious about losing control of women's sexuality and fertility through the use of contraceptives and illegal abortions. Most of the men were migrant laborers. They feared that contraceptive use would enable women to conceal evidence of extramarital affairs. Of course, women who used contraceptives did so secretly for fear of either being accused of infidelity or disobedience. Thus, contraceptive use was sensitive in as far as it gave women autonomy over their bodies.

Following independence, contraceptive use increased because of campaigns by the Zimbabwe National Family Planning Council (ZNPFC) and its international and local partners. Messages changed in tone to "family planning" and "child spacing," thus inviting men and women to take control in deciding the size of their families and intervals between births. The terms in quotation marks also suggest that only persons with families can plan them or those with children can space them. They have implications for those without families and those not socially approved as childbearers, such as unmarried and single persons. Hence, teenagers face challenges in accessing contraceptives, as discussed below.

Knowledge about contraceptives is "almost universal," according to the ZDHS 2010–2011; female respondents knew of at least six methods (ZimStat and ICF International 2012, 77). Contraceptive use is on the increase among married women in Zimbabwe; 59 percent use at least one modern method. Use of contraceptives is higher among educated professional women and those in urban areas and less so in rural areas and among the less educated. It is higher among unmarried, sexually active women, at 62 percent. The contraceptive pill (several brands are available) and condoms are the most commonly used contraceptives. They are sourced from public institutions and socially marketed through affiliates of the U.S.-funded Population Services International (PSI).

Teenage Sexuality and Reproductive Health Concerns

The high teenage pregnancy rate of 24 percent for 15- to 19-year-olds shows either preference for early marriage or an inability to control the outcomes of sex (ZimStat and ICF International 2012). Given limited sex education, as discussed above, one can surmise that there are gaps in

access to both information and technologies to control conception. As previously noted, cultural and religious concerns prevent comprehensive sexuality education. As married women, teens are allowed to “space” their children or “plan” their families. However, early marriage undermines future opportunities, as it cuts short schooling and precludes vocational training.

Customarily, pregnancy before marriage brings shame to the family of the pregnant girl. Often the shame is resolved through marriage to the male partner if he acknowledges paternity. According to the ZDHS 2010–2011, 2.8 percent of women were married by the time they were 15 years old (ZimStat and ICF International 2012, 50). This suggests “child marriage” is a phenomenon against which there is growing condemnation in the media. In many cases, because of poverty and unemployment, a young man evades commitment because of the economic pressure it brings to his family and the personal shame it brings to the offending young man when he is unable to look after his wife and children. Still, pregnant girls risk being chased away from home to extract bride-wealth from their offending boyfriends or being pressured into marriage because their own families do not wish to carry the burden of caring for a child with unemployed parents. The resulting structural violence visited on young women under these circumstances is yet to be documented as human rights violation. At a popular level, the shame of pregnancy out of wedlock should be a deterrent. When it is not, young women are blamed for a lack of self-restraint.

Abortion Rights

Abortion is illegal in Zimbabwe except for rape, incest, or medical reasons, such as a risky pregnancy. However, backstreet abortions often take place at the risk of women’s lives. According to Population Reference Bureau (PRB) estimates, there were 36 unsafe abortions per 1,000 women aged 15–44 years in 2011 in Zimbabwe (PRB 2011). An estimated 70,000 abortions took place in 2014 according to media reports. This points to unmet contraceptive needs or lapses in contraceptive use. In either case, there is a need for alternative courses of actions, such as better access to morning-after pills. Postabortion care is universally accessible to all women, without criminalization, when they present at health facilities. When deliberate and intentional actions to terminate a pregnancy are discerned, such as when relatives make reports, women run the risk of prosecution. Chikovore et al.’s study suggests

that unmet contraceptive needs among unmarried and married women along with men’s propensity to evade obligations when pregnancies occur are at issue (2002). This is often the reason why some women end up as single parents. For unemployed women, single parenting means a life of reduced opportunities for themselves and their children.

Access to HIV/AIDS Treatment

An estimated 1.5 million Zimbabweans are HIV positive, 830,000 and 150,000 of whom are women and children, respectively (UNAIDS 2016). This constitutes 4 percent of global HIV infections (UNAIDS 2014). More than half of HIV positive persons (63.4% of adults and 54.6 % of children) are on lifelong antiretrovirals. HIV treatment sites have increased from 530 in 2010 to 1459 in 2014 (UNAIDS 2014).

With the HIV prevalence rate at 15 percent, it is a considerable decline from what it was in the 1990s. Children most likely become infected from untested mothers, either during birth or later during routine care, such as breastfeeding. Since 1995, when antiretrovirals became widely used, there are protocols for the prevention of mother-to-child transmission (PMTCT) of HIV. These protocols entail counseling pregnant women while attending antenatal care and encouraging them to voluntarily test for HIV. Women who test positive are given, with their consent, antiretrovirals that reduce their viral loads, thus reducing the transmissibility of HIV to the baby during labor, birth, or breastfeeding. According to UNAIDS, there has been a 50 percent decline in child infections in Zimbabwe (UNAIDS 2014, 10).

The success of the PMTCT has encouraged pregnant women to test for HIV. However, the stigma of HIV/AIDS is such that testing comes with heavy burdens of ostracism on disclosure to male partners and relatives. Women often risk being accused of sexual impropriety (such as infidelity) in contracting HIV. Relatives, such as mothers-in-laws, who have an interest in nurturing babies (their grandchildren) to maturity, may insist on feeding babies gruels and herbal preparations, when in fact doctors recommend exclusively breastfeeding for the first six months, weaning, and then baby foods thereafter without mixed feeding as a way of ensuring that babies do not contract HIV. Despite the decline in HIV prevalence and new infections, young women and girls remain among the most vulnerable to infection because of cultural preferences for hypergamy,

poverty, and men taking advantage of young women and girls from poor families. (UNAIDS 2014, 20). Furthermore, the criminalization of sex work makes HIV prevention more difficult.

Tuberculosis has also become a major public health concern because it is an opportunistic infection in most (82%) HIV-infected persons (UNAIDS 2014). Screening and treatment is available free of charge.

Gender-Based Violence (GBV)

According to the ZDHS 2010–2011, 30 percent of women surveyed experienced gender-based violence (GBV) a month before the survey (ZimStat and ICF international 2012). Susceptibility to violence by a male partner increased with marriage, childbirth, and employment. However, the study also noted differences in prevalence of GBV by region, the education level of women, and marital status (never married women reported no violence). There are nongovernmental organizations (NGOs) concerned with gender violence, such as Musasa Project and Zimbabwe Women Lawyers' Association, who give counseling and legal advice, among other services. Shelters for survivors of violence are rare on account of limited resources.

Following the passage of the Domestic Violence Act, Makahamadze et al. (2012) did a study to find out awareness of the act and its provisions among Christian women of diverse denominations. Their respondents were wary about reporting spouses for violence, arguing that it would deprive them and their children of breadwinners and plunge them into worse economic difficulties. Indications are that GBV is underreported because of dependence, respect, and propriety calculus that women have internalized. Victim-friendly courts and desks at police stations are available though. It is not clear whether refresher courses are available for the police and court officials given changes in the economy.

Female Genital Cutting (FGC) and Female Genital Mutilation (FGM)

Zimbabwe lies in a region where Type IV female genital cutting (FGC), sometimes called female genital mutilation (FGM), is practiced. Type IV FGM includes pricking, piercing, incising, cauterizing, stretching/extending, or elongation of genitals for nonmedical reasons. FGM is an example of harmful cultural practices against women that epitomize patriarchal imperatives on women's bodies. Often, these practices have a range of public health

problems for women, including fistulae, obstruction of the birth canal, and urine retention, among other problems. However, there is a paucity of research data on harmful effects of Type IV FGM, as above. The most salient infamy of labia elongation is that it is done for male pleasure and makes women desirable as wives. Its practice went underground in colonial times, forestalling debate on it in Zimbabwe. Perhaps this is why Zimbabwe does not feature in WHO maps as an FGM country.

Studies show that Type IV FGM is controversial given growing trends toward genital cosmetic surgery and modifications (including piercings and tattooing) among girls and women in developed Western countries (Braun 2005; Johnsdotter and Essen 2010). The "harm" of genital modifications for nonmedical reasons in this instance has become scrambled. These studies raise questions about sexuality, eroticism, and choice in the context of sexual and reproductive health rights.

In Zimbabwe, the secrecy surrounding the topic does not enable open academic or activist discussion or comparison of marital stability between those with elongated labia and those without. Anecdotal reports show that even when women have complied with expectations by elongating their labia, they still remain susceptible to violence and infidelity through which men express their displeasure or dissatisfaction with women and their power over them. Unorthodox strategies in marriage counseling, including by some Pentecostal Church founders' wives, claim that labia elongation is a key part to fidelity, marital stability, and sexual satisfaction. It is important to note, though, that Pentecostal interventions in marriage often come with behavior changes based on Pauline doctrines found in the letters of St. Paul in the Christian New Testament. It may be that the latter is more potent to changes in marriage than labia elongation per se. From a feminist point of view, it is clear that the women the world over may be influenced by the male gaze or male perspectives about what is attractive and desirable in their bodies. Pending studies on the matter, one can surmise that the prevailing silence on Type IV FGM belies reality.

Virginity Testing

In 2001, in the wake of high HIV prevalence rates among youth, one traditional leader advocated for virginity testing of all girls in his area. Virgins would be given certificates, and apparently such certificates were supposed to be a source of pride for parents of the girls. This raised a lot

of controversy about the violation of girls' bodily integrity and privacy when their virginity was publicly declared in certificates. There were problems raised about the lifelong humiliation of those declared "nonvirgins." There was also the glaring problem that given an HIV pandemic that was spreading through heterosexual sex, virginity testing reinforced the idea that women and girls are gatekeepers of sexuality and morality because boys and men were not tested for virginity.

The notion of women and girls as gatekeepers renders them blameworthy for perceived social ills of sexuality in total disregard of the power relations and dynamics under which sexual relations take place, including the facts that coercion and flagrant sexual violence are common. It is part of the tool kit of patriarchal controls of women. Virginity was traditionally highly valued in Southern African bridewealth cultures. Virgins attracted higher bridewealth (more cattle) and ensured wealth and prestige for their families, while also assuring their husbands of chastity and fidelity. Chastity was the assumed foundation for fidelity.

Some media report incidents of virginity testing before girls are given away in arranged marriages to older men in some churches (Chibaya 2013; *The Zimbabwean* 2012). There are no academic studies on virginity testing in these conservative and closed sects. However, many are founded and dominated by men and embrace aspects of "African traditions" as part of their teachings.

In parts of South Africa, where virginity testing surged in the wake of HIV/AIDS, there were questions raised about folk science and its methodologies in virginity testing, with many activists concluding that the practice is a violation of children's rights as it entailed visual and physical examination girls' genitals by older women (Scorgie 2002). These discussions did not arise in Zimbabwe but are also applicable.

Employment

With 67 percent of the population living in rural areas, Zimbabwe's economy is agro-based. Women dominate in the rural economy. Beyond this, employment statistics in Zimbabwe remain controversial. Government statistics say that unemployment is 11 percent (ZimStat 2012), but using methods recommended by the International Labour Organization (ILO), unemployment is 5 percent (ILO 2017). However, these statistics do not bode well with ordinary Zimbabweans living under chronic economic and political crises and deepening poverty who have been laid

off or have been unable to find wage work since leaving school in the late 1990s. This is why the public, including the media, prefers to say that unemployment is more than 80 percent (for example, Osika 2010). Thus, while international organizations count informal-sector work as "active economic activity," many Zimbabweans see informal-sector work as less than ideal and more for survival, under conditions of despair, insecurity, and harassment by law enforcement agencies. Workers do not have fringe benefits, such as time off when sick, pregnant, or simply to rest, and no pensions. Thus, when international organizations use official statistics, they are seen as aiding the discursive minimization of unemployment challenges in Zimbabwe and doing public relations work for the government.

Notwithstanding the foregoing, the ZDHS 2010–2011 shows that 57 percent of women had not worked in the 12 months preceding the survey, 37 percent were in formal work, and the rest were self-employed (ZimStat and ICF International 2012, 35). In rural areas, the dominant activity is agricultural work; in urban areas, it is sales and services.

The government is the largest employer, but it is also notorious for low wages. Since dollarization, many government workers earn less than USD\$500 per month, which is the total consumption poverty line (TCPL). Calls and strikes for wage increases have come to naught, in part because the economy cannot support higher wages. These conditions have increased tensions and calls for political changes.

From the foregoing, it is clear to see that while Zimbabwe has made strides toward gender equality, conservative interests constantly tug and claw at the progress on gender equality. The conservative interests have a voice and leg room to reverse gender equality in part because of the domination of one political party that opportunistically appeases and punishes different groups as part of cementing its own legitimacy. In this respect, it remains to be seen how well the new constitution lives up to its promises.

Culture and Family Life

Culturally, Zimbabwe is largely neopatrilineal, that is, influenced by cultures in which identity is conferred by fathers (so children take their fathers' surnames); post-marital residence is virilocal (women relocate to their husbands' place of residence). In urban areas, the impact of virilocality is less pronounced. In rural areas, the impact of virilocality includes isolation typical of learning a new

culture and living among strangers. Kinship norms and practices combined with practices of virilocality could be the basis of marginalization of married women, who are seen as strangers or outsiders (albeit desirable) in their husbands' villages and families. Consequently, married women are blamed for mishaps and not entitled to a share of resources of their husbands' lineage, such as land, cattle, and other items. Meanwhile, unmarried women are seen as transient in their own lineages because they are expected to marry into other families.

Historically, wives could use land as secondary users (dependent on their husbands' primary access) and had access to draught animal power, milk, and other products, again, as secondary users. This means married women had no power of disposal of the property nor could they inherit in the event of widowhood. These cultural practices emanate from distortions of cultural practices in the colonial era under what are broadly referred to as "customary laws," which cannot be discussed here due to limitations of space.

Bridewealth continues as the cornerstone of Zimbabwean family life and is the foundation of marriage. Its payment defines social adulthood and responsibility for the paying young men and dignity and respect for the women for whom it is paid and their families. Its payment in full precedes white weddings and the court registration of marriages. It is not mandatory in the law to pay bridewealth, but families insist. A refusal to pay it is seen as deviant and stokes the wrath of ancestral spirits, which apparently wreak havoc for generations. Churches also support bridewealth payments.

Bridewealth payment is not benign; it is fraught with meaning and symbolism about gender roles and relations. The payment of bridewealth symbolizes an acknowledgment of the loss of a woman's labor contribution because of virilocality. It serves as compensation for this loss. In turn, bridewealth signifies acceptance of transfers of returns of a married woman's labor (both economic and reproductive) to her husband's family. In this sense, then, children belong to the husband, and all property accruing to a married woman also belongs to him, except for domestic utensils or appliances in some modern interpretations. Furthermore, wives could not inherit from their husbands because of not being members of the same lineage. Inequality between spouses also emanated (and still does) from the fact that men are expected to be older than women and to have better economic potential or better-paying jobs.

Because bridewealth payment is tied to the prestige of all parties—the payee and his family as well as the receiving family and their daughter—these payments are passionately defended in many quarters. The passion belies gender injustices tied to bridewealth. Anticipation of bridewealth payments could be linked to child marriages among poor families as well as the abuse of women and children. By promising to pay bridewealth, rapists and pedophiles can evade prosecution by marrying their victims. The prevalence of such cases is hard to establish, but it is an accepted practice that a man can offer to marry a woman or a girl he "seduced" by paying or promising to pay bridewealth. If the marriage eventually breaks up, its demise is not linked to its beginning. It could be attributed to the woman's conduct, such as failure to please or obey her husband. Anecdotal reports also show that after paying bridewealth, some men expect total obedience from their wives and respond with abuse when they feel shortchanged. The reality, though, may be that men use bridewealth to claim their rights because violence occurs in societies that do not pay bridewealth.

Since independence, reforms to personal and family laws have chipped away at some aspects of gender inequality in marriage by promoting and ensuring procedural safeguards for spousal inheritance, no-fault divorces, child custody, equality in conferring identity to children, and child maintenance, allowing the possibility of equality between spouses. However, there are no campaigns against bridewealth per se because it seems to be sacrosanct. Androcentric discourses of nationalism of the 1990s filtered into the courts, leading to rulings against gender equality, such as the *Magaya v. Magaya* case in 1999. This was an inheritance dispute between a half-brother and half-sister (children of the same father but with different mothers). The female plaintiff was the older of the two and born of the first wife. She had been denied the right to inherit her father's estate by lower courts that had argued that under African customs daughters could not inherit their fathers' estates ahead of sons. Her half-brother won. The Supreme Court (the highest court in Zimbabwe) upheld this decision to international outcry about gender discrimination.

Colonial social engineering, which privileged male labor migration, wage earning, and urban residence and was supported by Christian missionaries, left an indelible imprint on the Zimbabwean family and cultural ideals. Until independence in 1980, the Zimbabwean family was ideally composed of a male urban migrant and wage

earner (relatively better educated) married to a woman who lived in a rural area, where she occupied herself as a farmer, working on land that belonged to the male migrant or his family. She was less educated and also responsible for domestic work and child care. As strenuous as these arrangements were to marital and family relations, they created fathers and husbands who were distant authority figures with unilateral control of resources.

Historically, women went to urban areas and sought out men (husbands, fiancés, or boyfriends) for accommodation and protection. In anthropology, as well in the popular imagination, “town women” became a reference for anomalous women. Women in urban areas were suspected of being sex workers, vagrants, nuisances, or otherwise deviant for apparently eschewing rural life. Rural women were seen as more trustworthy, decent, and marriageable because they remained accountable to rural patriarchs. Over the years, family migration to urban areas has been tolerated. However, derogatory notions of town women persist to this day as an undercurrent that seems to condone wanton harassment of women on suspicions of engaging in sex work or being un-African if fashionably dressed (high heels, makeup, tight or short clothes, see-through fabrics, etc.).

Nonrecognition of Same-Sex Relationships and Families

The 2013 constitution says Zimbabweans who are 18 years old and older are free to legally marry and voluntarily start families in the absence of coercion. However, same-sex marriages are prohibited. Consequently, in Zimbabwe, the family is defined as heterosexual. However, with men evading responsibilities under the weight of economic challenges, living arrangements are taking many configurations. According to the 2012 census, 65 percent of households are headed by a male; the rest are likely headed by a female or child or have another configuration (ZimStat 2012, 13).

The average household size has 4.2 persons. In general, female-headed households have a higher propensity for poverty because of male biases in access to such resources as land and credit and also because of a long history of male-biased access to education and labor markets.

There are no legal protections for LGBT individuals; discrimination is not banned. Individuals may change gender, but it requires surgery. Procreation is so prominent in society that these prohibitions are perceived to be more about protecting it than an actual sexual relationship or

activity with someone of the same sex. Researchers found that even though there was strong Christian influence on the views that led to the formalization of these laws, young boys and girls do engage in same-sex sexual activities, but this remains invisible and, in the case of girls, unimportant (Shoko 2010).

Marriage and Fertility

The majority of women between 15 and 49 years old are married (60%); another 2.8 percent are cohabiting; and the rest are single, divorced, separated, or widowed (ZimStat and ICF International 2012). Women marry earlier, at an average age of 19.9 years. By contrast, only 51 percent of men between 15 and 49 years old are married. Men marry later in life, at around 24 years of age. This makes men dominant partners in most marriages. On average, Zimbabwean women have 3.4 children in their lifetimes. The population growth rate has stalled (less than 1%) because of the effects of HIV/AIDS (World Bank 2015).

Politics

Zimbabwe gained independence from Great Britain in 1980, following about two decades of armed struggle. The war ended after a negotiated settlement called the Lancaster House Agreement in 1979. This agreement allowed elections by universal suffrage for the first time and created a constitution. The Lancaster House Constitution remained in use, albeit with more than 15 amendments, until 2013, when a new constitution came into effect.

The Zimbabwe African Nationalist Union–Patriotic Front (ZANU-PF) emerged victorious in the 1980 elections. It has since dominated Zimbabwean politics by intimidating rivals and monopolizing the media and through biased constitutional amendments. Immediately after independence, ZANU-PF followed socialist policies, but it abandoned socialism as the Cold War ended in 1989 and then pursued neoliberal market reforms from 1990 to 1995.

The rapidness of constitutional amendments intensified calls for constitutional reforms. This was followed by drawn-out reforms from 1999 to 2013, when a new constitution was finally signed into effect. The period of constitutional reforms was also a time of socioeconomic and political crises with far-reaching effects on the status of women and relations between men and women. Due to limitations of scope, these crises cannot be discussed

here in detail save to mention that by end of the 1990s, Zimbabwe was isolated in international relations following a radical, defiant, and unplanned land reform program against the advice of donors. Donors withdrew aid, and service delivery was severely incapacitated. Poverty grew to 77 percent of the population by 2013 (ZimStat 2015); strong opposition to ZANU-PF hegemony emerged, but so did contestations over electoral laws, party funding, and election results, leading to long periods of political stalemate, violence, mutual suspicion, and polarization. By 2015, the opposition had been disorganized by infighting, poor funding, and, perhaps sabotage by its nemesis, if past events are anything to go by.

Political Economy and Implication for Gender Policies

Zimbabwe's independence was in the middle of the first UN Decade for Women (1975–1985). The decade was characterized by assumptions that women were *excluded* in economic development, the so-called Women in Development (WID) approach. This influenced Zimbabwean policies on women and led to a number of legislative reforms, such as legal majority at 18 years; equal pay for equal work; nondiscriminatory labor relations, including three months of maternity leave on reduced pay for women in wage work; no-fault divorce; and spousal inheritance between 1980 and 1985.

These changes did not actively seek to change living arrangements or beliefs about male-female and generational relations. It is no surprise there was a growing undercurrent against gender equality; it was perceived as un-African and antifamily. Despite women's participation in the war as combatants and auxiliaries and claims of pursuing socialism, there was no clear definition of gender equality, commitment, or agenda for the transformation of gender relations. For example, extending legal majority at 18 to women was criticized for undermining male authority (Ranchod-Nilsson 2006, 61). These masculine arguments persisted until constitutional reform consultations in 1999 and again between 2009 and 2012.

The Lancaster House Constitution had “claw-back clauses,” such as Section 23, which allowed discrimination against women on “cultural grounds.” Despite the creation of the Ministry of Community Development and Women's Affairs (MCDWA) in 1981 to accolades of progress, Women's Affairs was subsequently reduced to a department shunted back and forth between marginal portfolios under male ministers. Its longest and revelatory sojourn has been

in those ministries that are domiciled at ZANU-PF headquarters and concerned with mobilizing party support, lending credence to the argument that most socialist governments see youth and women's wings as means of mobilizing support rather than as empowering marginalized sections of society.

In the economic crises of the 1990s, conservative voices gained strength by arguing for a return to tradition in response to HIV/AIDS as well as the informalization of the economy, which saw growing numbers of women becoming economically independent, albeit through low-income informal-sector activities. This saw the passage of the Traditional Leaders Act (of 1999) that affirmed the role of traditional leaders as “custodians of culture.” However, what is referred to as “Zimbabwean culture” is male-biased and imbued with expediencies of colonial crises and concerns about controlling women encapsulated in what is called “customary laws.” Thus, two decades into independence, despite talk of change in male-female relations, patriarchal controls were preferred.

Women's Access to Land

Land reform took place in waves with one thing in common—bias against women. In the 1980s, land redistribution was part of poverty alleviation. The program targeted internally displaced persons because of the war, returning refugees, the landless, and other destitute people. Redistribution was slow at first, but it stalled in 1983 because of budgetary challenges. Of the families that were given land, few female-headed households benefited because women were not recognized as “heads of households” much less as breadwinners. This misrecognition emanated from distortions of African customs during the colonial era. Among male-headed households that benefited from land, women's rights to land were still insecure on divorce or widowhood. Inheritance and property laws changed later.

In the 1990s, land redistribution targeted elites because of demands for proof of income and the ability to invest in the land. Most beneficiaries were men. In 2000, when “fast-track” land reforms were launched, still only 12–18 percent of beneficiaries were women (Moyo 2011, 504). This limited access is attributable to technocrats' limited appreciation of gender issues and the need appeal to tradition; thus, land is given to “the family,” which in many instances is understood as male-headed. In a study of land recipients engaged in sugar production, Mate (2001) found

that inheritance was male-biased (given to sons) because of pressure from local farmer organizations and compliance to patrilineal norms. However, sons were more likely to spend on personal leisure and their own needs, risking the existences of their siblings and mothers.

Women's Activist and Advocacy Movements

Because of WID approaches, Zimbabwe, like most governments worldwide, had a WID unit in the manner of MCDWA headed by a female ex-combatant, Joyce Mujuru (who later rose to become vice president). Other than the usual weaknesses endured by WID units, such as not questioning relations between men and women, limited funding, lack of staff, and lack of technical expertise on women's issues because of the novelty of the approach, MCDWA was not powerful, in that it had no mandate to change laws nor to monitor other ministries for compliance. MCDWA worked closely with the ZANU-PF women's wing, thus pursuing party policies ahead of women's concerns. Initially, MCDWA was accepted as offering a platform for action. Things changed in 1983 when in response to moral panics fanned by the media about "wayward women" who apparently brazenly practiced prostitution, divorced their husbands, and wantonly abandoned or killed newborn babies (locally called "baby dumping"), spurred by a raft of pro-women legislative changes, the government authorized a cleanup operation against vagrants. The crackdown ended up targeting women seen walking alone in the evening in Zimbabwean cities. The moral panics point to anxiety in some sections of society vis-à-vis legislative changes on gender relations and becoming pro-women.

Pundits incited the government to rein in female mobility, much like had happened in the colonial era. Six thousand women were rounded up and deported to remote resettlements because they were assumed to have nothing to occupy themselves with; hence, they were believed to be threatening societal norms and morals by walking alone in the evening. However, because there had been a major drought in 1981, the 1983 land resettlement had stalled because of lack of , and women were bypassed as beneficiaries. These things went unnoticed. The abandonment of babies points to failures of male-headed families and implies abandonment by male partners, gaps in contraception, and other social challenges that made men evade responsibility. Blaming women points to age-old patriarchal tricks of making women gatekeepers of

sexuality and morality while men have final say. The fact that women who could prove that they were married were released sooner while those of unverifiable marital statuses had a harder time being freed was indicative of the misogynistic tendencies in sections of government and the ruling party.

The MCDWA's silence irked feminist activists. MCDWA's protest that it was neither consulted on the operation nor approved fell on deaf ears. The cozy relationship between the MCDWA and feminist activists ended when it became clear that MCDWA was under the guidance of an androcentric party whose government had authorized the misogynistic "cleanup." This led to the formation of women's nongovernmental organizations (NGOs). Women's Action Group (WAG) was the first in 1983. It was formed by professional women who were not party activists. The women were immediately condemned by top MCDWA officials as "elitist" (unlike the party that claims to stand with the masses) and under the influence of donors. By 1995, there were 25 registered women's organizations (Essof 2013, 38). Differences in strategy on gender issues were seen on many subsequent occasions, such as land reforms, when the government did not want to clarify women's land rights, preferring "family units," and parliamentary debates on domestic violence, in which male prerogatives as heads of households, including disciplining family members, were defended and challenged.

The 14th constitutional amendment, in which officials reacting to a Supreme Court ruling that Zimbabwean women could confer citizenship to their non-Zimbabwean spouses and children, sought a backdoor reversal, arguing patrilineal exogamy (women marrying out of their lineages thus out of their country) or, conversely, that male members of the patrilineage conferred identity to wives and children among others. These differences culminated in a coalition of women's NGOs campaigning for the "No vote" in the referendum on the first draft constitution of 1999. The "No vote" won, much to the dismay of the government and ZANU-PF. The win opened floodgates of mutual distrust and political harassment that widened the chasm between government and NGOs in general, which were seen as instruments of donors and foreign governments.

The New Constitution and Implications for Gender Equality

A new constitution came into effect in 2013. Its tenets are yet to be tested in the courts, and effects on people's

lives are yet to be assessed. The constitution has “gender balance” and a need to ensure “the full participation of women in all spheres” of society, politics, and the economy as guiding principles. It has an elaborate bill of rights in Chapter 4, Part 3, and Sections 48 to 78, including the right to freedom of expression, assembly, thought, and privacy and freedom from discrimination. Part 4 of the same chapter is titled “elaboration of certain rights.” It lists constitutional rights of specified groups, such as women, children, the elderly, persons with disabilities, and war veterans. Concerning women, not only does it emphasize “equality with men in all areas of life,” it also refers to equality in child custody. In Section 80, subsection 3, it states that where cultural beliefs or practices lead to discrimination, the constitution will take precedence. Despite these principles, bridewealth payments continue, and their explicit and implicit meanings remain. The new constitution establishes independent commissions to deal with gender, human rights, and other issues. The impact of these institutions is yet to be felt.

Despite the guiding principles of the new constitution, women’s performance in the 2013 elections fell short of gender balance. There are currently only 36 women members of Parliament (MPs) in the National Assembly (the lower house), with 270 seats, and 16 female senators in the Senate (the upper house), with 80 seats. However, the presence of these women and advocacy groups that lobby parliamentarians has seen significant changes, especially through the nonpartisan Women’s Caucus. The caucus is concerned with gender mainstreaming in law and decision making. Its Web site says that it lobbied traditional leaders and other stakeholders to support the Domestic Violence Bill in 2007; it also managed to have marital rape included in the Sexual Offences Act. In parliamentary and media debates on the Domestic Violence Bill in 2007, Christiansen (2009, 179–182) notes that there were concerns about the bill being “Eurocentric,” undermining men’s prerogative to control and discipline their wives, and that it would lead to increased marital discord and divorce. The bill was seen as antithetical to Zimbabwean “culture” and “traditions.”

Furthermore, marital rape is seen by many men as inconceivable by virtue of the fact the payment of bride-wealth entitles men to exclusive rights to have sex with their wives. Women are socialized into believing that once married they cannot deny their husbands sex. Sex is seen as a marital duty to be performed diligently as part of

sustaining a conjugal union. Consequently, getting marital rape included as a crime is an achievement. It allows women to talk about gender-based violence more broadly than just physical, emotional, or economic abuse. It can also be matrimonial sex. However, since the passage of the act, there are no known reported cases of marital rape. Perhaps, this shows that women too have internalized the idea that marital rape is inconceivable.

A

Argentina

Overview of Country

Geographically the second-largest country in South America (following Brazil) and the eighth-largest country in the world, Argentina spreads across a significant portion of southern South America. Nestled between Chile and Uruguay, it also shares borders with Bolivia, Brazil, Paraguay, and the Atlantic Ocean. Argentina's sprawling landmass covers approximately 1.08 million square miles (2.8 million sq. km), making it about three-tenths the size of the United States. Argentina's landscape includes the rich northern plains found in the Pampas, a distinctive biodiverse geographical feature of South America; Patagonia's flat and rolling plateau in the south; and the rugged terrain of the Andes Mountains along the western border. The name *Argentina* originates from the Latin word for silver, "argentum." The country is known for its silver and other natural resources, including lead, zinc, tin, copper, iron, manganese, petroleum, uranium, and arable land (CIA 2017).

The population of Argentina was estimated to be 43,886,748, as of July 2016 (CIA 2017). The coastal city of Buenos Aires, situated along the western shore of the Rio de la Plata estuary just south of Uruguay, is both the nation's capital and most populous city. Ninety-one percent of the population lives in urban areas, including nearly one-third

of the total population who reside in the capital city. The remaining two-thirds of the population are mostly spread throughout the northern and central regions of the country. The southern Patagonia region remains the least densely populated. The population is predominately white (mostly of Italian and Spanish descent), 97 percent. The remaining 3 percent of the nonwhite population primarily identifies as Amerindian or mestizo (mixed white and Amerindian ancestry) and have indigenous roots.

Argentina's history can be broken up into four categories: the pre-Columbian time through the 16th century; the colonial period, 1530–1810; the nation-building era, 1810–1880; and modern Argentina, 1880 to the present. After being colonized by Spain in the 16th century, Argentina emerged as a democratic republic in the 19th century, but it has periodically fallen to military rule. When Argentinians learned that Spain had been invaded by Napoleon, they were quick to begin a war for independence, which lasted eight years, 1810–1818. Prior to the official end of the war, Argentina declared independence on July 9, 1816.

Following independence from Spain in 1816, Argentina went through periods of political conflict and unrest, which included conflict between political conservatives and liberals as well as between the civilian and military factions. These events resulted in Argentina being ruled by a military junta, or military dictatorship. The military defeat over Argentina led to the building and expansion of the Spanish Empire. Between the years of 1853 and 1861,

2 Argentina

a federal state was formed that is known to this day as the Republic of Argentina.

During the Spanish conquest, many indigenous peoples were forced from their homelands. As European immigration increased, it led to the displacement and genocide of the indigenous population. More than 1,300 indigenous peoples lost their lives from governmental efforts to build railways (Bartolomé 2003). A state policy was developed with the intended purpose of increasing European immigration. The immigration policy, which admitted all able-bodied Europeans, regardless of ethnic origin, lasted until 1930. Between 1888 and 1980, the Argentine government paid ocean passages for 132,000 Europeans (Solberg 1982). Europeans immigrated in large numbers, and in 1895, immigrants accounted for 52 percent of the total population.

A landmass as big as Argentina was attractive to many immigrants because it was in the beginning of an economic expansion. By 1914, Argentina had the second-highest rate of immigration globally, preceded only by the United States. Between 1857 and 1924, 40 percent, or 1.3 million immigrants, were Italian, and during the same time period, nearly 1 million emigrated from Spain, making it the largest overseas destination for Spanish immigrants (Solberg 1982). While Argentina was viewed as a land of golden promise, many immigrants never intended to stay. With a goal of finding fortune and returning home, rates of emigration were quite high: 46.6 percent for Italians and 42.5 percent for the Spanish. Since the 1930s, immigration policies have grown more restrictive, and since the 1950s, they have gained more force as a result of growing economic instability and a series of military dictatorships (MPI 2006).

It took many revolutions and wars for Argentina to become a democratic country, including the “Dirty War,” which is known as the country’s darkest time. The last military dictatorship was in power from 1976 to 1983. Jorge Rafael Videla led the military juntas up through 1981, followed by Roberto Viola and Leopoldo Galtieri in 1983. During their leadership, they abused the government’s military and security forces to repress any political dissidents or anyone thought to be a dissident or associated with socialism. The staggering amount of violence and extreme nature of repression that occurred during this time resulted in the era becoming widely known as *Guerra Sucia*, or the “Dirty War.”

Junta leaders were responsible for illegal arrests, tortures, killings, and the forced disappearances of more than 30,000 civilians. Killings included the mass shootings and “death flights,” where people were thrown to their

deaths from planes into the ocean. Nearly 12,000 were taken prisoner and forced to work in concentration camps throughout the country. Those who were unaccounted for during the war are known as *los desaparecidos*, or “the disappeared.” After seven years of a military dictatorship marked by violent repression, torture, and fear, civilian president Raul Alfonsín was inaugurated on December 10, 1983, resulting in Argentina’s status as a democratic state.

Argentina’s culture and population have been shaped by the country’s legacies of colonization and immigration. The country’s official language is Spanish, but other commonly spoken languages include Italian, French, and English. Argentina is the largest Spanish-speaking country in the world.

The Roman Catholic Church has great cultural influence. While the Argentine Constitution guarantees freedom of religion for all, it also states that the federal government is Roman Catholic. In 1994, the constitution was changed to reflect that being Roman Catholic while in leadership is no longer a requirement. Ninety-two percent of Argentineans identify as Roman Catholic; however, less than 20 percent report regularly practice their faith. Some indigenous communities follow Catholic customs, but others have kept their traditional beliefs. For example, in the Catamarca province, an annual festival honors Pachamama, the representative of Mother Earth. Of the remaining 8 percent of the population, 2 percent are Protestant, 2 percent are Jewish, and 4 percent identify as “other” (CIA 2017).

Argentina was one of the world’s wealthiest nations 100 years ago, but it spent much of the 20th century enduring a series of on ongoing economic crises, including account deficits, high inflation, capital flight, and mounting external debt (CIA 2017). The country experienced a period of severe economic depression between 1998 and 2002, with the economy collapsing at the end of 2001 and beginning of 2002. The interim president Adolfo Rodríguez Saá declared a default on the government’s foreign debt in December of 2001. Following this declaration, President Rodríguez Saá resigned, after serving a brief week in office. Appointed by Congress, Eduardo Duhalde took office in January of 2002 and ended the Argentine peso’s one-to-one peg with the U.S. dollar. At the point of bottoming out, the real gross domestic product (GDP) was 18 percent lower than in 1998, and nearly 60 percent of the population was living below the poverty line (CIA 2017).

Presidents Néstor Kirchner (May 2003–December 2007), Cristina Fernández Kirchner, and, most recently,

Mauricio Maci (elected in December 2015) have been seeking to stabilize the economy through new fiscal policy and the promotion of sustainable economic development. Recent investments in health and education have resulted in an increased GDP over the past decade (World Bank 2016). With a 2016 GDP of more than USD\$550 billion, Argentina has one of the largest economies in Latin America and has been a regional leader in the reduction of poverty. Between 2004 and 2008, incomes at the bottom 40 percent grew 11.8 percent, and the poverty rate has improved to 12.7 percent (World Bank 2016). Argentina is considered an upper middle-income (USD\$4,125–12,735) nation (WEF 2016b).

Argentina ranks 40th out of 188 countries and territories based on its 2014 Human Development Index (HDI) value. The HDI value of 0.836 is a 23.8 percent increase from its 1980 score of 0.675, demonstrating an average annual increase of about 0.63 percent (UNDP 2015). This score puts them just ahead of Chile (42nd, 0.832), which makes them the only two countries in Latin America to fall within the “very high human development” category. Average life expectancy is 76 years old, and the population benefits from nearly a 98 percent adult literacy rate (Constantine 2015). Population growth continues to increase, but it has been tempered by its steadily declining birth rate. The population under 15 is shrinking, but the youth population, aged 15–24, is the largest in the country’s history (6.7 million), which is likely to positively boost the workforce in coming years (CIA 2017).

Overview of Women’s Lives

Argentina has been a regional leader in the expansion of women’s rights. In the 2014 Social Institutions & Gender Index (SIGI) report, Argentinean women were reported to face a very low level of discrimination. The SIGI takes into account cultural attitudes, practices, and both informal and formal laws that restrict the access of women and girls to rights, justice, and empowerment opportunities. Well situated to be a leader in development and implementation of a regional agenda for gender equality, a commitment was made through a signed letter of intent to establish a country office in Argentina during an official visit of the UN secretary-general in August of 2016. This letter highlights the adoption and launch of the National Action Plan for the Prevention, Assistance, and Eradication of Violence against Women and corroborates the country’s commitment to equality between women and

men and the empowerment of women (UN Women 2016). Despite inclusion in politics and business, Argentinean women can still find themselves shadowed by the historically traditional Catholic influence and the deeply patriarchal “machismo” culture (FSD 2015a).

The Gender Development Index (GDI), which measures gender inequalities in three dimensions of human development (health, education, and command over economic resources) scored Argentina at 0.982 in 2014. The closer a score is to 1.0, the more equality between women and men exists. The Gender Inequality Index (GII) for Argentina was 0.376, ranking it 75th out of 155 countries. The GII examines gendered inequalities in the following three dimensions: reproductive health (measured by birth rates and maternal mortality); empowerment (measured by the share of parliamentary seats held by women and attainment in secondary and higher education); and economic activity (measured by participation levels in the labor market). In Argentina, for every 100,000 live births, 69 women die due to pregnancy-related issues, and for every 1,000 adolescents (ages 15–19), there are 54.4 births. Women hold 36.8 percent of the parliamentary seats, and 56.3 percent of Argentinean women have completed at least secondary-level education. Participation in the labor market is 47.5 percent of women, compared to 75 percent for men (UNDP 2015).

The largest disparities in gender equity are related to socioeconomic status, with women from lower classes experiencing greater levels of inequality. Multiple reports cite gendered violence among the top human rights problems facing Argentina; other top issues include corruption and torture by police, child abuse, and infringements on the rights of indigenous people (U.S. Department of State 2015). The Inter-American Commission on Human Rights, which held a hearing on the Situation of Human Rights of Women in Argentina in March 2013, reported that indigenous women are especially vulnerable to human rights abuses in Argentina (SIGI 2016).

Girls and Teens

Economic globalization has driven a wedge between the rich and poor, and children from poor families have experienced the burden of this divide. Around 7 percent of children aged 5–14 work to contribute to their families’ food and health needs. Rural families experience the highest rates of poverty, resulting in children living in poor health and having little chance at a higher education.

4 Argentina

The mortality rate for children under 5 years of age is 11 percent (Ramel 2011). The economic crises have affected dropout rates, but subsidy programs that provide meals for students have been cited as successful mechanisms for preventing students from dropping out (FSD 2015b).

Ninety-nine percent of youth have access to education (Ramel 2011), and access is fairly equal between girls and boys. There is virtually no gender gap at the primary education level, and the existing gap in secondary education shows a disadvantage toward boys (SIGI 2016). On average, girls attend more years of schooling than their male counterparts. Girls are anticipated to attend school for 18 years, compared to 16 years for boys (CIA 2017). The percentage of youth (15–24) not employed or attending school is 18.6 (UNDP 2015).

As of December 2005, there were 1,671 cases of HIV/AIDS recorded among teens (13- to 19-year-olds), with a male-to-female ratio of 1.96:1 for diagnoses of AIDS and 0.8:1 for positive HIV diagnoses (PAHO 2007). Suicide was the second-leading cause of death for all 13- to 19-year-olds in 2005; homicide topped the list for males and traffic accidents for females. In more recent years, femicide among teens has become a growing issue. On average, 21 adolescent girls are victims of femicides every year; the evidence demonstrates that not only are there more gender-motivated killings annually, but the number of victims under age 18 is rising (Frayssinet 2015).

Extracurricular

Soccer is one of the most popular sports; however, women are not encouraged to play. Women's soccer, or *futbol*, is underfunded; therefore, girls and women who want to play have a hard time finding resources to do so. Swimming, tennis, and field hockey are the most popular sports for girls and women. During school, girls often participate in hockey or volleyball. The only activities that are practiced by both girls and boys during adolescence are tennis and swimming.

Education

Education has historically been highly valued and is still very important for the new generation. The Argentine Constitution states education will be free for all those who live in the country. Following the economic crises of the early 2000s, there was an increase in absenteeism, especially among students from lower socioeconomic classes,

leading to retention difficulties. As of 2003, high school completion data showed only 27.3 percent of low-income students completed high school in comparison to 73.1 percent of middle-class students (UNESCO-IBE 2008). Climbing out of one of the worst political, social, and economic crises in its history, between 2004 and 2006, Argentina made a reinvigorated commitment to education and enacted the following state policies during this period: teacher salary payment guarantee and 180 class days (January 8, 2004); National Fund for Teacher Incentive Law (August 31, 2004); Technical Professional Education Law (September 8, 2005); Education Financing Law (January 9, 2006); Reproductive Health Education Law (October 23, 2006); and National Education Law (December 28, 2006) (UNESCO-IBE 2008). The two most influential policies were the National Education Law and the Education Financing Law, which reestablished education as a public good and fundamental obligation of the state and upped the GDP investment from 3.5 percent to 6 percent, respectively (UNESCO-IBE 2008).

The Global Gender Gap Index ranked Argentina 54th out of 144 countries for the education attainment of women and girls, and it was 33rd overall (WEC 2016a). As of 2015, nearly all girls attended primary school (98%), 92 percent attended secondary school, and 98 percent enrolled in tertiary education (WEC 2016b). Despite solid commitment to and follow-through of educating women and girls, Argentina does not leverage female talent well, ranking it 101st on the Economic Participation and Opportunity subindex. (WEC 2016a)

Mandatory education consists of nine compulsory grades from the ages of 6–14 years. Equivalent to the U.S. primary and secondary school, basic general education (EBG) is broken into several categories: EGB I: 1st, 2nd and 3rd grades; EGB II: 4th, 5th, and 6th grades; and EGB III: 7th, 8th, and 9th grades. Kindergarten is optional for students aged 4 and 5. The next educational level is secondary school, which consists of a minimum of three years and is equivalent to U.S. community college. Secondary education in Argentina is called *Polimodal*, which means multiple modes, because students design their own program. Secondary school is optional, but it is a requirement for admission to college. Unlike the United States, the duration of higher education is set by the universities according to the chosen major. Buenos Aires is the home of South America's largest university, the University of Buenos Aires, which enrolls more than 350,000 students and employs 29,000 staff.

Health

Argentina has fully closed its gender gap on the Health and Survival subindex as of the *Global Gender Gap Report 2016* (WEF 2016b). With a score of 0.98, it shares the top spot on the Health and Survival subindex along with 40 other countries. This subindex considers two key indicators in the differences between women's and men's health: the sex ratio at birth, which aimed to uncover the "son preference" practices, and the gender gap in life expectancy (WEF 2016b). Despite closing the gender gap on the Health and Survival subindex, Argentina has much room to grow in the areas of health care and education. The UN Population Fund (UNFPA) has been active in the country since 2003 and works to promote sexual and reproductive health and rights by supporting the implementation of comprehensive sexuality education policies to prevent adolescent pregnancies and HIV. UNFPA's work has been vital to the increased availability and use of sexual and reproductive health services (including family planning, maternal health, and HIV); the development of evidence-based policies; and for making comprehensive health (including sexual health) a priority for Argentine youth, particularly for adolescent girls (UNFPA 2015).

Access to Health Care

The government strives to offer access to quality health care for its people, but access outside Buenos Aires and other urban areas can be difficult. The national constitution has guaranteed universal health coverage since 1994. The health care system is organized around three main providers: the public sector, the private sector, and mutual plans. The public sector covers about half of the population and provides free clinical care for all inpatients and outpatients; the latter group is typically charged for medications. The private sector charges out-of-pocket expenditures and serves the wealthiest 5–10 percent. Mutual plans, also known as social plans, are administered by unions, and both employers and employees pay a fixed fee. The "mutual" plan then covers the cost of medical care and medicines in varying proportions; the differences between the fixed fee and the actual cost are paid by the patient.

Maternal Health

Despite these structures in the wake of Argentina's economic collapse, half of the population and 65 percent of children were left without health insurance (CDG 2015).
